N is the 14th letter in our alphabet. It was also the 14th letter in the alphabet used by the Semitic peoples, who once lived in Syria and Palestine. Its symbol apparently came from the Egyptian *hieroglyphic* (picture symbol) for *snake.* Later Western Semitic traditions called this letter *nun,* which was the word for *fish.* The Greeks took over the letter from the Phoenicians and called it *nu.* See **Alphabet.**

Uses. *N* or *n* is about the fifth most frequently used letter in books, newspapers, and other printed material in English. In mathematics, *n* represents an indefinite number. As an abbreviation, *n* may stand for *noun, neuter, noon, name,* or *not. N,* in chemical formulas, means *nitrogen;* in geographic descriptions, *north* or *northern.* In medieval Roman numerals, *N* represented 90 and $\overline{N}$, 90,000.

Pronunciation. In English, a person pronounces *n* by placing the tip of the tongue against the gums behind the front teeth and making the sound through the nose. In such words as *hymn,* the final *n* is silent. But in such words as *gnostic* or *mnemonic,* the first *n* is pronounced, and the letter before it is silent. Double *n,* in words such as *manner,* is pronounced like *n.* In words like *pen-name,* each *n* is pronounced. The letter has much the same sound in classical Greek and Latin, and in French and German. In Spanish, when written with a tilde, *ñ,* it has a *ny* sound, as in the English word *canyon.* See **Pronunciation.**

Marianne Cooley

Development of the letter N

The ancient Egyptians drew this symbol of a snake about 3000 B.C.

The Semites, about 1500 B.C., wrote the letter in this form.

The Phoenicians simplified the Semitic symbol about 1000 B.C.

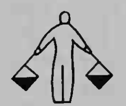
The Greeks changed the letter and added it to their alphabet about 600 B.C. They called it *nu.*

The Romans, about A.D. 114, wrote the letter N with straight lines.

The small letter n developed about A.D. 500 from Roman writing. Monks who copied manuscripts modified the letter during the 800's. By about 1500, the n had its present shape.

n — A.D. 500
n — 800
n — Today

Special ways of expressing the letter N



International Morse Code

Common forms of the letter N

Nn *Nn*

Handwritten letters vary from person to person. *Manuscript* (printed) letters, *left,* have simple curves and straight lines. Cursive letters, *right,* have flowing lines.

Nn *Nn*

Roman letters have small finishing strokes called *serifs* that extend from the main strokes. The type face shown above is Baskerville. The italic form appears at the right.

Nn *Nn*

Sans-serif letters are also called *gothic letters.* They have no serifs. The type face shown above is called Futura. The italic form of Futura appears at the right.

N

Computer letters have special shapes. Computers can "read" these letters either optically or by means of the magnetic ink with which the letters may be printed.

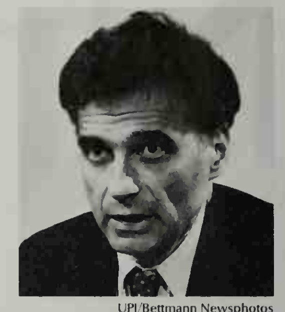
Nabokov, *NAH boh kawf,* **Vladimir,** *VLAH duh meer* (1899-1977), was a Russian-born author. His novels are noted for their complicated plots and the complex attitudes they express toward their subjects. Critics praised Nabokov's novels for their wit, intricate word use, and rich language. His novels, often satirical, include *Invitation to a Beheading* (published in the Soviet Union, 1938; United States, 1959), *The Real Life of Sebastian Knight* (1941), *Lolita* (published in France, 1955; United States, 1958), *Pnin* (1957), *Pale Fire* (1962), and *Ada* (1969). Nabokov published collections of stories and poetry and translated several Russian literary classics into English. *Speak, Memory* (1951, expanded 1966) is his autobiography. A collection of his lectures at Cornell University in the 1950's was published as *Lectures on Literature* (1980). *The Stories of Vladimir Nabokov* was published in 1995.

Nabokov was born in St. Petersburg. The family fled to Western Europe in 1919 because of the Bolshevik revolution. Nabokov attended Cambridge University in England from 1919 to 1922. From 1922 to 1940, he lived in Berlin and Paris among other Russians who had left their country because of the revolution. He wrote his novels in Russian, and most were later translated into English. In 1940, Nabokov settled in the United States and began to write in English. He returned to Europe to live in 1959. Marcus Klein



Nabrit, James Madison, Jr. (1900-1997), won fame as a lawyer, university president, and diplomat. From 1960 to 1969, he was president of Howard University. He was the first black to become deputy U.S. representative to the United Nations (UN). He held the post in 1966 and 1967, while on leave from Howard.

Nabrit was born in Atlanta, Georgia. He graduated from Morehouse College and Northwestern University Law School. In 1936, he joined the faculty of Howard University. At his suggestion, the university established—and he taught—the first civil rights course in an American law school. Nabrit served as secretary of the university from 1939 to 1960, and as dean of its law school from 1958 to 1960. As president of Howard, he encouraged greater student involvement in the university. As a lawyer, he specialized in civil rights cases, especially school desegregation cases. Edgar Allan Toppin

Nader, *NAY duhr,* **Ralph** (1934-), an American lawyer, became famous for fighting business and government practices he felt endangered public health and safety. Nader also is an outspoken critic of the influence of large corporations on the American political system. In 1996 and 2000, he ran as the Green Party candidate for president of the United States. The Green Party's platform stresses environmental responsibility, respect for diversity, and social justice. Nader won only a small percentage of votes in either election, but his candidacy brought increased attention to the Green Party's causes.

In his book *Unsafe at Any Speed* (1965), Nader argued that the U.S. automobile industry emphasized profits and style over safety. The National Traffic and Motor Vehicle Safety Act of 1966, which established safety standards for new cars, resulted largely from his work.

Nader's studies of the meat and poultry industries, coal mines, and natural gas pipelines also resulted in stricter health and safety laws. He publicized what he felt were the dangers of pesticides, food additives, radiation from color TV sets, and excessive use of X rays.

UPI/Bettmann Newsphotos
Ralph Nader

Nader's operating funds come mainly from his writings and speeches, from foundation grants, and from contributions. In 1971, Nader founded an organization called Public Citizen, Inc., which he headed until 1980. The organization specialized in energy problems, health care, tax reform, and other consumer issues. Nader and his staff conducted a major study of Congress in 1972. In 1982, another Nader group published a study of the Reagan Administration.

In 1988, Nader's efforts helped bring about the passage of California's Proposition 103, a law that provided for lowering some auto insurance costs. Nader won another battle in 1989 when General Motors announced it would make air bags standard equipment on many 1990 models. Nader had promoted the use of the safety feature for more than 10 years. In the 1990's, Nader also spoke out on such issues as campaign finance reform, trade policy, globalization, corporate abuse, universal health care, and criminal justice reform.

Nader was born in Winsted, Connecticut, the son of Lebanese immigrants. He graduated from Princeton University and Harvard Law School. Frederick E. Webster, Jr.

Nadir, *NAY duhr,* is the point in space directly below where one stands. To an observer on the earth, the sky appears to be a half-dome whose edge forms a great circle resting on the flat surface of the earth. Imagine a plumb line suspended from the center of this dome, directly above your head, and passing through the center of the earth and into space as far as the central point of the invisible half-dome beneath the earth. The two points marking the ends of the imaginary plumb line are, respectively, the *zenith* and the *nadir.* They are the poles of the horizon, and each is 90° from the horizon. See also **Zenith.** Lee J. Rickard

Nagana. See **Tsetse fly.**

Nagasaki, *NAH guh SAH kee* (pop. 444,599), is the Japanese city with which Westerners have had the longest contact. Its harbor was opened to foreign trade in 1571. After 1637, it was the only Japanese port where Westerners were allowed to trade. Dutch traders were permitted to set up a trading post on an island in the harbor, and one Dutch ship each year was allowed to call at the post. In 1857, it was one of the six Japanese ports opened to foreign trade.

Nagasaki is on the west coast of the island of Kyushu. It is important as the Japanese port city closest to the mainland of China. Nearby coal fields provide a source of soft coal for export. Nagasaki is on a landlocked bay, which is deep and large enough to hold many ships. For location, see **Japan** (political map).

Because Nagasaki has a large steel rolling mill, it is an important shipbuilding center. Many of its factories were destroyed on Aug. 9, 1945, by the second atomic

bomb used in warfare (see **Nuclear weapon** [picture]). The blast destroyed 1.8 square miles (4.7 square kilometers) in the heart of the city. It injured 40,000 people, and 40,000 were killed or missing. Since the war, most of Nagasaki has been rebuilt. Kenneth B. Pyle

Nagoya, *nuh GOY uh* (pop. 2,171,378), is one of the largest cities in Japan. It is the capital of Aichi prefecture on the island of Honshu. It stands on Nobi Plain, facing Ise Bay (see **Japan** [political map]).

Nagoya was once the seat of the powerful *daimyo* (baron) of Owari, a province of early Japan. In 1610, a great castle was built in Nagoya by the powerful feudal lord Tokugawa Ieyasu. The castle was destroyed during World War II (1939-1945), but was rebuilt in 1959.

Nagoya is famous as a manufacturing center. It has an important textile industry. It also manufactures machines, pottery, porcelain, lacquerware, clocks, fans, and embroidery. Nagoya's industries and its population are crowded into a closely packed area. Kenneth B. Pyle

Náhuatl. See **Aztec** (Language).

Nahum, *NAY uhm,* **Book of,** is a book of the Hebrew Bible, or Old Testament, named for an Israelite prophet. Nahum lived in the kingdom of Judah during the second half of the 600's B.C. The book has three chapters. Chapter 1, a hymn, is a vision of God that may be the work of another author. In chapters 2 and 3, Nahum praises the capture and destruction in 612 B.C. of Nineveh, the capital of the hated and feared Assyrian empire. His description of the city is so vivid that some people believe he actually lived to witness Nineveh's fall. The poetic style of the book is among the most elegant in the Bible. Nahum's striking images of God's wrath along with images of God's refuge and safety lend great power and immediacy to the prophet's words. Eric M. Meyers

Naiad. See **Nymph** (In mythology).

Nail is the most widely used fastener for attaching one piece of wood to another. Nails also join wood and such materials as cloth, sheet metal, and wire. Special nails hold wood and other materials to brick and concrete.

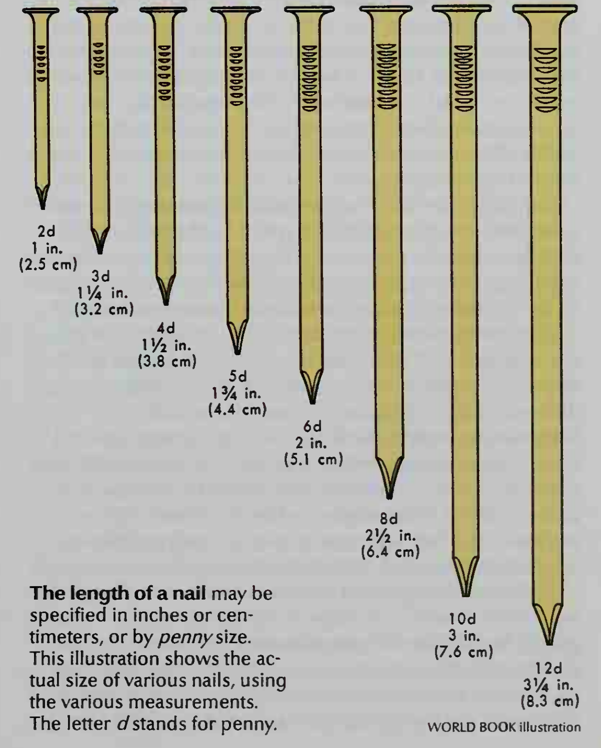
Most nails are made of steel, but some are made of aluminum, brass, copper, or stainless steel. Steel nails may be plated with aluminum, copper, nickel, or zinc to resist rust. Some nails have a coating of *resin,* an adhesive substance that makes them hold more tightly.

Carpenters generally use a *claw hammer* to drive nails. This kind of hammer has a *claw* for removing nails. Many carpenters who build or remodel houses use a power tool called an *automatic nailer.* This tool can drive nails more quickly than a regular hammer.

The parts of a nail. A nail has three main parts: (1) the point; (2) the *shank,* or body; and (3) the head. The point acts as a wedge that separates the fibers of wood as the nail is driven. After the nail is in place, the fibers grip the shank and keep the nail from loosening. The head covers the hole made by the nail.

The most common type of nail point is the *diamond point,* a sharp point that works well in most kinds of wood. A *blunt point* works better in some hardwoods, such as maple and oak. This point breaks off some of the wood fibers and helps keep the wood from splitting.

Most nails have a smooth, round shank. Nails with a twisted, threaded, or ringed shank hold better but cost more. A narrow shank helps prevent splitting of hardwoods or of thin boards. Nails with a square shank are used to attach wood flooring to concrete.

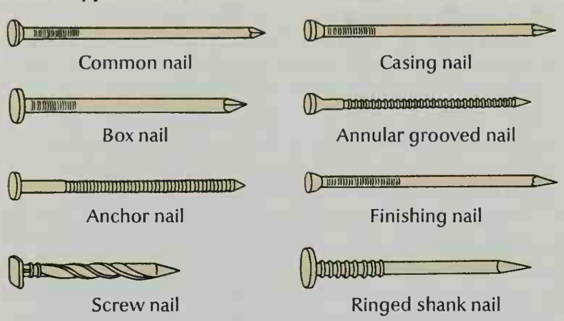


Most kinds of nails have a broad, flat head. A nail with a narrow head can be hidden in the wood by driving it completely below the surface with a punchlike tool called a *nailset.* The hole left by the nail can be filled with putty and then painted. Roofers use a nail with an extra wide head to install shingles. Upholsterers use tacks with decorative heads if the tacks can be seen.

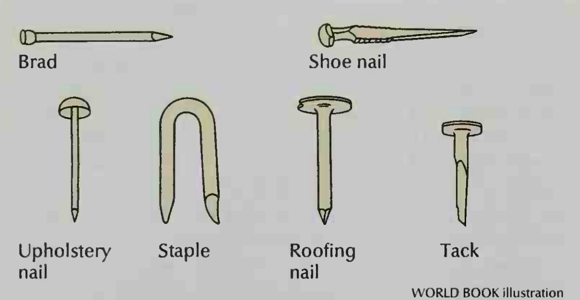
Sizes of nails. Nails are usually measured in units called *pennies,* designated by the letter *d.* Nails measured in this way range in size from 2-penny nails that are 1 inch (2.5 centimeters) long to 60-penny nails 6 inches (15 centimeters) long. Nails that are shorter or longer than those are measured in inches or centimeters. The system of measuring nails in pennies probably began in England several hundred years ago.

How nails are made. The earliest nails were made about 5,000 years ago in Mesopotamia. Artists used them to fasten sheets of copper to wooden frames to make statues. In the early 1700's, American colonists hammered nails by hand from a bar of hot iron. About 1775, Jeremiah Wilkinson, an inventor in Cumberland, Rhode Island, developed a process for cutting nails from a sheet of cold iron. About 1851, William Hassall (or Hersel), a machinist in New York City, invented the first machine for making nails from wire.

Today, almost all nails are made from wire by a machine that can produce more than 500 per minute. Wire is fed into the machine from a large coil. A set of cutters trims off a length of wire and forms the point of the nail at one end. At the same time, a hammer shapes the head



Some nail sizes



The length of a nail may be specified in inches or centimeters, or by *penny* size. This illustration shows the actual size of various nails, using the various measurements. The letter *d* stands for penny.

WORLD BOOK illustration

Some types of nails

Nails have various shapes, depending on the purposes for which they are used. The different types of nails can be distinguished by their head, *shank* (body), and point.

Specialty nails and other metal fasteners are made for specific jobs. For example, they may be used in making shoes, in upholstering furniture, or to hold roofing materials.

at the other end. The nails are then polished, plated, or coated. Alva H. Jared

Nail is a tough plate that covers the upper surface at the end of each finger and toe. It is a special growth of the *epidermis* (outer portion of the skin) and is made up of hardened cells. The skin below the nail, from which it grows, is called the *matrix.* Near the root of the nail, where growth begins, the blood flow in the cells is less visible. The white, crescent-shaped spot indicating this area is the *lunula.*

If a nail is torn off, it will regrow if the matrix has not been severely injured. White spots on the nail are due to bruises or other injuries. They will grow out as the nail grows. The state of a person's health is often indicated by the nails. Illness often affects their growth.

The horns, claws, talons, and hoofs of birds and animals are made of the same materials as the nails on the fingers and toes of the human body. Deer antlers are a different kind of growth. Paul R. Bergstresser

Naipaul, *ny PAWL,* **V. S.** (1932-), is a West Indian-born novelist, travel writer, and social commentator. He writes about many cultures and societies. Naipaul's recurrent theme is the clash of older traditions and practices with the raw aggressiveness of modern political life. Naipaul won the 2001 Nobel Prize in literature.

Vidiadhar Surajprasad Naipaul was born in Chaguanas on the island of Trinidad to descendants of immigrants from India. He was educated in the West Indies and at Oxford University in England. After completing his studies, he settled in England. His early fiction tended toward the lightly comic. Naipaul first gained recognition with his satirical novel *A House for Mr. Biswas* (1961). The novels *Guerrillas* (1975), *A Bend in the River* (1979), *A Way in the World* (1994), and *Half a Life* (2001) have political themes. Naipaul's many travel books include *An Area of Darkness* (1965), about India; *Among the Believers: An Islamic Journey* (1981), about the Middle East; and *A Turn in the South* (1989), about the Southern United States, as well as books about Africa and the Caribbean. He has also written short stories collected in *A Flag on the Island* (1967) and journalism pieces.

Michael Seidel

Nairobi, *ny ROH bee* (pop. 1,162,189), is the capital of Kenya and the most important commercial center in eastern Africa. The city lies on a high plateau in south-central Kenya (see **Kenya** [map]).

The central area of Nairobi has many modern buildings, and its main streets are lined with trees. This area includes the parliament buildings, the Kenyatta Conference Center, the Holy Family Cathedral, the Jamia Mosque, and hotels and commercial buildings. The National Museum and the University of Nairobi are north of the central area. Railroad yards and an industrial area lie to the south. About 5 miles (8 kilometers) farther south, but still within the city, is Nairobi National Park. The park covers 44 square miles (114 square kilometers) of open land where lions, gazelles, gnus, zebras, and other wild animals live.

Many of Nairobi's people live in large, low-cost apartment complexes called *estates.* Other residents occupy single-family homes.

The Kenyan government is a major employer in Nairobi. Industries in Nairobi produce beverages, cement, chemicals, clothing, foods, furniture, glass, machinery, paint, shoes, soap, and textiles. Tourism is an important part of the city's economy. Many people visit Nairobi National Park and take trips to other Kenyan game reserves. Nairobi is a center for banking, trade, and other commercial activities. It also is an important railroad center.

Nairobi was originally the site of a water hole called *Enkare Nairobi,* which means *cold water.* The city became a railroad center in the early 1900's. In 1963, when Kenya became independent from the United Kingdom, the area of Nairobi was expanded from about 35 square miles (91 square kilometers) to 266 square miles (689 square kilometers). Stephen K. Commins

See also **Kenya** (pictures).

Naismith, *NAY smihth,* **James** (1861-1939), invented the game of basketball in 1891 (see **Basketball**). He wanted to develop a game that could be played indoors during the winter months. He tacked up two peach baskets and used a soccer ball for the first game. He invented the game when he was a physical-education teacher at the International YMCA Training School (now Springfield College) in Springfield, Massachusetts.

Naismith was born in Almonte, Ontario. He graduated from McGill University in Montreal. Naismith was one of Canada's greatest rugby and lacrosse players. He studied for the ministry but became a physical-education teacher. He was director of physical education at the University of Kansas from 1898 to 1937. He became a United States citizen in 1925. Bob Logan

Namath, *NAY muhth,* **Joe** (1943-), became one of professional football's most successful and colorful quarterbacks while playing for the New York Jets from

1965 to 1976. He was known for his accurate passing and skillful play selections. He passed for 27,663 yards and 173 touchdowns during his pro career. In 1967, Namath became the first pro quarterback ever to pass for more than 4,000 yards in a single season.

Joe William Namath was born in Beaver Falls, Pennsylvania. He starred at quarterback at the University of Alabama, which he attended from 1961 to 1965. Namath was drafted by the Jets when the team was a member of the five-year-old American Football League (AFL). His success helped lead to the merging of the AFL and the established National Football League (NFL) in 1970. In 1969, Namath helped lead the Jets to a 16-7 upset over the Baltimore Colts in Super Bowl III. Namath played his last NFL season in 1977 with the Los Angeles Rams. He was voted into the Pro Football Hall of Fame in 1985. He became a TV sports commentator and actor.

Carlton Stowers

Name. Everyone has a name, unless some extraordinary circumstance has isolated a person from all human contact. Some people have many names. In Western nations, most people have three names—two *given* names and a *family* name. The given name consists of a first name and a middle name. It is often called a *Christian* name. The family name is also called the *surname* or *last name.* All three names together make up the *legal name.* A person may also have one or more nicknames.

All names have meanings, though people today may not be aware of them. Documents reveal that early peoples gave someone a name with a definite knowledge of the meaning of the name. In the Bible, for example, a widow exclaims, "Call me not Naomi [pleasant], call me Mara [bitter]: for the Almighty hath dealt very bitterly with me" (Ruth 1: 20). People in India, Israel, and some African nations still give names with specific meanings.

This article discusses the cultural and national characteristics of names and describes their origins. For information about proper etiquette in the use of names, see **Address, Forms of.**

Given names

Most of the common given names come from Hebrew, Greek, or Latin, or from Teutonic languages.

Hebrew names taken from the Bible have traditionally provided the most important source of Christian names. The most commonly used Hebrew names are *John* (gracious gift of God), *Mary* (wished for), and *Michael* (who is like God). Other common Hebrew names include *David* (beloved), *Elizabeth* (oath of God), *James* (may God protect, or one who takes the place of another), *Joseph* (the Lord shall add), *Hannah* (God has favored me), and *Samuel* (God has heard). These Biblical names occur in various forms among all Christian nations.

Greek and Latin names often refer to abstract qualities. Common Greek names include *Alexander* (helper of humanity), *Barbara* (stranger), *George* (farmer), *Helen* (light), *Margaret* (pearl), *Philip* (lover of horses), and *Stephen* (crown or garland). Common Latin names include *Clarence* (famous), *Emily* (flattering), *Patricia* (of noble birth), *Victor* (conqueror), and *Virginia* (maidenly).

Teutonic names are widely used and are among the most popular Christian names, especially boys' names. They usually consist of two elements joined together without regard to their relationship. For example, *William* is composed of two name elements, *Wille* (will, or resolution) and *helm* (helmet). But the name *William* does not mean "helmet of will" or "resolute helmet." It means "will, helmet." Some of these name elements are found at the beginning, as *ead* (rich) in *Edwin* and *Edmund.* They may also occur at the end, as *weard* (guardian) in *Howard* and *Edward.*

Middle names, or second Christian names, occur frequently today. Many people have as their middle name the *maiden name* of the mother—that is, the surname the mother had before her marriage. In France and Spain, double Christian names appeared in the Middle Ages. The Germans in Pennsylvania used several forenames in colonial times. But middle names did not become common in the United States until after the Revolutionary War (1775-1783).

Other given names. In the United Kingdom and the United States, family names may often be used as Christian names. Such names as Percy, Sydney, and Lincoln are now recognized Christian names. Some of the outstanding leaders in the United States, including Washington Irving, Hamilton Fish, Franklin Delano Roosevelt, and Jefferson Davis, had such names.

Traditionally, Roman Catholic parents have given a saint's name to a child. This is not difficult, because most common Christian names now have been borne by one or more saints.

Ethnic names

Black names. Before the 1960's, the names of black Americans resembled those of the white population. But after the rise of the civil rights movement in the 1960's, some blacks changed their names for religious reasons or to reflect their African heritage.

A number of blacks have converted to the Muslim religion and taken Muslim names. For example, the basketball star Ferdinand Lewis Alcindor, Jr., became Kareem Abdul-Jabbar. The boxer Cassius Marcellus Clay changed his name to Muhammad Ali.

Some blacks have given their children names from such African languages as Arabic, Igbo, Kikuyu, Swahili, or Yoruba. Children have such African names as *Aba* (born on Thursday), *Aduke* (much loved), *Marjani* (coral), or *Dakarai* (happiness). The writer LeRoi Jones changed his name to Imamu Amiri Baraka. *Imamu* means *spiritual leader* in Swahili. *Amiri Baraka* is an Arabic name.

Hispanic names. In Spain and other Spanish-speaking countries, a child traditionally takes the surname of both the mother and the father. The father's name comes first. These names were formerly joined by *y,* the Spanish word for *and.* For example, Julio, the son of Rodrigo Ruiz y González and Maria López y Chávez, would have been known as Julio Ruiz y López. This custom, however, is no longer followed.

Among Spanish-speaking people in the United States, a hyphen may join the two names, as in Julio Ruiz-López. The name may also be shortened to Julio Ruiz to conform to the standard method of naming in the United States.

American Indian names reflect the culture of a particular tribe. Names are always symbolic, though each tribe has its own naming tradition. Sometimes names are kept secret because of religious laws.

Generally, Indians have a birth name, such as *Sunrise Beauty;* a family name, *Smooth Water;* and an adult name, *White Mountain.* Another name may be occupational. For example, a construction worker may be called *High Walker.* For legal identification purposes, many Indians assume Americanized names, such as *Willard Countryman* or *Frank Beaver.*

In many tribes, a child has one name at birth and other names in later stages of life. As individuals take a new name, they discard the earlier one.

History of family names

Beginnings. The Chinese were the first known people to acquire more than one name. The Emperor Fuxi is said to have decreed the use of family names, or *surnames,* about 2852 B.C. The Chinese customarily have three names. The family name, placed first, comes from one of the 438 words in the Chinese sacred poem *Baijia Xing* (also spelled *Po-Chia Hsing*). It is followed by a *generation name,* taken from a poem of 20 to 30 characters adopted by each family; and a *milk name,* corresponding to a Christian name. In the United States, the Chinese often follow Western practice and put the family name last.

In early times, the Romans had only one name, but later they also used three names. The *praenomen* stood first as the person's given name. Next came the *nomen,* which indicated the *gens,* or clan. The last name, the *cognomen,* designated the family. For example, Caesar's full name was *Gaius Julius Caesar.* A person sometimes added a fourth name, the *agnomen,* to commemorate an illustrious action or remarkable event. Family names became confused by the fall of the Roman Empire, and single names once again became customary.

The Middle Ages. Family names came into use again in northern Italy about the late A.D. 900's, and became common about the 1200's. Nobles first adopted family names to set them apart from the common people. The nobles made these family names hereditary, and they descended from father to children. The nobility called attention to their ancestors in this way. A family name became the mark of a well-bred person, so the common people began to adopt the practice too.

The Crusaders carried the custom of family names from Italy to the other countries of Western Europe. Throughout Europe, wealthy and noble families first adopted family names. At first, these were not hereditary, but merely described one person. For example, the son of Robert Johnson might be known as Henry Robertson, or Henry, son of Robert.

Origin of family names

It is difficult to work out a simple classification of family names, because of corruption and changes in spelling and pronunciation. Many old words are now obsolete or have obsolete meanings. For many years, the spelling of names depended on the discretion of the writer. The same name might be spelled in different ways in the same document. Some names appear to come from English words, but they are from another language. Foreign names are often altered into more familiar words. The Dutch *Roggenfelder* (dweller in or near a rye field) became the American *Rockefeller.*

Family names have come down to us in a variety of ways. They may have developed from a person's surroundings or job, or from the name of an ancestor.

Place names came from a person's place of residence. For example, if a man lived on or near a hill or mountain, he might be Mr. *Maki,* if from Finland; Mr. *Dumont* or Mr. *Depew* in France; Mr. *Zola* in Italy; Mr. *Jurek* in Poland; or Mr. *Hill* in England. In England, people might be known as *Wood, Lake, Brook, Stone,* or *Ford* because of their location. During the Middle Ages, few people could read. Signboards often exhibited the picture of an animal or object to designate a shop or inn. A person working or living at the place might be called *Bell, Star,* or *Swan.* A person might also be named after the town he or she came from, such as *Middleton* or *Kronenberg.* Many English place names may be recognized by the endings *-ham, -thorp, -ton, -wic,* and *-worth,* meaning a homestead or dwelling.

Occupation. Family names also come from a person's job. Names like *Baker, Carpenter, Clarke* (the British pronunciation of clerk), *Cook, Miller,* and *Taylor* are quite common. The most common surname in English is *Smith.* It is also common in many other countries. It takes the form of *Schmidt* in Germany, *Lefevre* in France, *Ferraro* in Italy, and *Kuznetzvo* in Russia.

Ancestor's name. Many people took surnames from their father's given name. Practically every language has a suffix or prefix meaning "son of." Some names that include the term "son of" include Irish names beginning with *Mc* or *Mac,* German names ending in *-sohn* or *-son,* and Scandinavian names ending in *-sen* or *-son.* Russian and Serbian names ending in *-ovitch* and Romanian names ending in *-escu* have the same meaning. Those describing the bearer of the name as the *son of John* include *Johnson* and *Jackson* in England; *Johns* and *Jones* in Wales; *Jensen, Jansen,* and *Hansen* in Denmark; *Jonsson* and *Johanson* in Sweden; *Janowicz* in Poland; *Ivanov* in Russia and Bulgaria; *Janosfi* in Hungary; and *MacEoin* in Ireland. Irish names beginning with *O'* signified a grandson. Less common names indicating relationships include *Brothers, Eames* (uncle), and *Watmought* (Wat's brother-in-law).

Many surnames came from terms that described an ancestor. In the Middle Ages, most Europeans lived in small villages, and needed only a single name. When the village clerk had to note in his records that a villager named Robert had paid a tax, he often had to identify just which Robert was meant. The clerk would then add some descriptive word without consulting the man involved. For example, he might call a man *Robert, the small. Gross* and *Groth* come from the German, and indicate a fat or large person. Names like *Reid, Reed,* and *Read* are early spellings of "red" and refer to a man with red hair. These red-haired men probably received the nickname of "Red."

Other family names may have more than one origin. For example, the common English surname *Bell* may designate one who lived or worked at the sign of the bell, or it may refer to the bell maker or bell ringer. It may also indicate the descendant of *Bel,* or pet form of *Isabel,* or it may be a nickname for *the handsome one,* from the Old French word *bel,* or beautiful.

Jewish family names were the last to develop in most countries. In Europe, Jews usually lived apart from others. Many did not feel the need for family names. Laws

The origin and meaning of some common given names

This table shows the origin and probable meaning of a number of given names. Many names are so old that scholars can only guess at their meaning.

Name	Origin	Meaning
Alexander	Greek	helper of humanity
Amy	French	beloved
Andrew	Greek	manly
Ann, Anne	Hebrew	graceful
Anthony	Latin	praiseworthy or priceless
Barbara	Greek	stranger
Benjamin	Hebrew	son of the right hand
Brian	Celtic	strong
Carl, Charles	Teutonic	man
Catherine	Greek	pure
Christopher	Greek	Christ bearer
Daniel	Hebrew	God is my judge
Darlene	Anglo-Saxon	darling
Deborah	Hebrew	bee
Dennis	Greek	of Dionysus, the Greek god of wine
Dorothy	Greek	gift of God
Douglas	Celtic	dark water
Edward	Teutonic	rich guardian
Elaine, Ellen	Greek	light
Elizabeth	Hebrew	oath of God
Emily	Latin	flattering
Eric	Teutonic	kingly
Francis, Frank	Teutonic	free
Frederick	Teutonic	peaceful ruler
George	Greek	farmer
Gerald	Teutonic	strong with a spear
Gloria	Latin	glorious
Harold	Teutonic	warrior
Helen	Greek	light
Henry	Teutonic	ruler of the home
James	Hebrew	may God protect, or one who takes the place of another
Jane, Janet	Hebrew	gift of God
Jean	Hebrew	gift of God

Name	Origin	Meaning
Jeffrey	Teutonic	God's peace
Jennifer	Celtic	white
Joan	Hebrew	gift of God
John	Hebrew	God's gracious gift
Joseph	Hebrew	the Lord shall add
Judith, Judy	Hebrew	Jewish woman or praised
Julia, Julie	Latin	youthful
Karen	Greek	pure
Laura	Latin	laurel
Lois	Greek	famous in war
Margaret	Greek	pearl
Mark	Latin	of Mars, the Roman god of war
Mary	Hebrew	wished for
Matthew	Hebrew	gift of God
Melanie	Greek	black
Michael	Hebrew	godlike
Nancy	Hebrew	grace
Natalie	Latin	Christmas child
Patricia	Latin	of noble birth
Paul	Latin	little
Philip	Greek	lover of horses
Rachel	Hebrew	ewe
Richard	Teutonic	rule, hard
Robert	Teutonic	bright fame
Ronald	Teutonic	advice, power
Samuel	Hebrew	God has heard
Sara, Sarah	Hebrew	princess
Steven, Stephen	Greek	crown or garland
Susan, Susannah	Hebrew	lily
Teresa, Theresa	Greek	harvester
Theodore	Greek	gift of God
Thomas	Aramaic	twin
Virginia	Latin	virginal, maidenly
Walter	Teutonic	powerful ruler
William	Teutonic	will, helmet

passed in the early 1800's compelled them to adopt surnames. Many Jews then chose pleasant combinations of various words like gold, silver, rose (*rosen*), mountain (*berg*), stone (*stein*), and valley (*thal*), to form such names as *Goldberg, Silverstein,* and *Rosenthal.* Others adopted names of cities where they were born, such as *London* and *Modena.* Some took names with religious connotations. *Katz* is an abbreviation of *kohen tzedek,* Hebrew for *priest of righteousness.* Others took surnames from given names, such as *Benjamin* and *Levy.*

Other names

Nicknames may be either descriptive terms or pet names. Descriptive terms, such as *Happy* and *Gabby,* usually express a person's prominent characteristics. Physical characteristics account for the largest group of nicknames. Sometimes they go by contraries, as when a husky football player is called *Tiny.*

Sometimes a nickname results from a child's attempt to pronounce a word or name, as *Lilibet* for Elizabeth. In other instances, a nickname is a translation of the person's real name. Many persons called New York City's mayor, Fiorello H. La Guardia, *The Little Flower,* a literal translation of his Italian first name. In many other cases, a nickname may consist of a person's initials, such as *F.D.R.* for Franklin Delano Roosevelt.

Pet, or nursery, names often consist of abbreviations of Christian names, such as Bob, Jimmie, and Debbie. They may be terms of endearment, or represent surnames, such as *Smitty* for Smith.

Pseudonyms are fictitious names assumed for anonymity or for effect. A *nom de plume* (pen name) is a writer's pseudonym. Many authors have assumed pen names. For example, *Voltaire* was the pen name of François Marie Arouet. Eric Blair, an English writer, wrote under the name of *George Orwell.* See **Pen name.**

An *alias* usually refers to the name taken by a criminal to disguise his or her identity. *Incognito* means the use of a fictitious name by a person, usually a celebrity, to avoid being recognized.

Stage names are names that some entertainers assume professionally. French actress *Sarah Bernhardt's* original name was Rosine Bernard. Many motion-picture performers have changed their names. For example, Frances Gumm was better known as *Judy Garland.*

The legal name of a person in the United States is the name by which he or she is known. Most legal names consist of a given name and a family name. Some states require that if a person does business under a name other than his or her own, the person must register it. A title, such as *Mr.,* or a suffix, such as *Jr.,* is not part of one's legal name. In many countries, names can be changed only by governmental permission. In the United States, a person can change a name without any court order. However, it is usually advisable to obtain a court order before changing the name. Wayne H. Finke

Namibia, *nuh MIHB ee uh,* is a country in southwestern Africa. It was formerly named South West Africa. Windhoek is the capital and largest city of Namibia.

Most of Namibia's people are blacks, but the territory was controlled by the white government of neighboring South Africa from 1916 to 1990. In March 1990, after many years of negotiations, Namibia gained full independence from South Africa.

Much of Namibia's land is dry and unfertile. But the land is rich in mineral deposits, including diamonds and uranium.

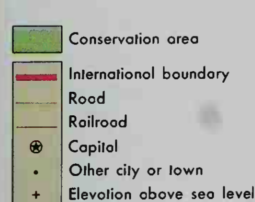
Government. Namibia's government is headed by a president. The people elect the president to a five-year term. The president may serve no more than two terms. Namibia's legislature consists of two groups—the National Assembly and the National Council. The National Assembly writes the nation's laws, and the National Council reviews them. The National Assembly has 72 members, elected by the people to five-year terms. The National Council has 26 members. Each of the country's 13 regional councils elects 2 members of the National Council to six-year terms. Regional council members are elected by the people. The president of Namibia appoints a prime minister from among the members of the National Assembly. The prime minister leads the assembly and assists the president in functions of government.

© Gerald Cubitt

Namibia is a country in southwestern Africa. Windhoek, the capital city, has modern downtown buildings.

Facts in brief

Capital: Windhoek.
Official language: English.
Official name: Republic of Namibia.
Area: 318,261 sq. mi. (824,292 km²). *Greatest distances*—east-west, about 880 mi. (1,420 km); north-south, about 820 mi. (1,320 km). *Coastline*—925 mi. (1,489 km).
Elevation: *Highest*—Brandberg, 8,465 ft. (2,580 m) above sea level. *Lowest*—sea level, along the coast.
Population: *Estimated 2002 population*—1,768,000; density, 6 persons per sq. mi. (2 per km²); distribution, 73 percent rural, 27 percent urban. *1991 census*—1,409,920.
Chief products: *Agriculture*—cattle, fish, sheep, corn, millet, vegetables. *Mining*—copper, diamonds, lead, uranium oxide, zinc.
Flag: A large blue triangle is in the upper left corner, and a large green triangle is in the lower right corner. A sun appears on the blue triangle. The triangles are separated by a red diagonal stripe bordered by white. Adopted 1990. See **Flag** (picture: Flags of Africa).
Money: *Basic units*—Namibian dollar and South African rand.



Namibia's most powerful political party is the South West Africa People's Organization (SWAPO). The main opposition party is the Democratic Turnhalle Alliance (DTA).

People. Blacks make up over 90 percent of Namibia's population. They belong to a number of ethnic groups. The Ovambo (also spelled Owambo) form the largest group. They comprise over half of the Namibian population. The Ovambo live in the north, near the Angolan border. This region is called Ovamboland or Ovambo. Other northerners include the Kavango, who live near the Okavango River; and the Caprivians, who inhabit the eastern end of the narrow strip of land called the Caprivi Strip. The Damara and the Herero occupy central Namibia. San and Tswana people live along the country's eastern border. Two groups of people of mixed ancestry live south of Windhoek—the Basters, who live in or near Rehoboth; and the Nama, who inhabit the far south.

Whites account for about 7 percent of Namibia's population. They include people of Dutch, English, and German descent. Namibia's population also includes people of mixed ancestry called Coloreds. Most of the whites and Coloreds live in or near cities or towns.

Most people of northern Namibia fish, grow crops, and raise livestock for a living. Many Ovambo and Kavango men also work in copper mines at Tsumeb or in diamond mines near the southern border. Most of the rural people south of Ovamboland farm and raise livestock. Many of Namibia's whites hold administrative jobs in urban areas. Whites generally have higher incomes than do blacks. But when Namibia gained independ-

Namibia

WORLD BOOK maps

ence, the government began working to raise the economic level of the blacks.

Namibia's official language is English. But most black Namibians speak local African languages. About 15 such languages are spoken in the country. About 90 percent of the people are Christians. Lutherans form the largest Christian denomination. Other Christian groups, in order of size, are Roman Catholics, Anglicans, and members of Dutch Reformed Churches.

Public schools provide Namibians with free education. The University of Namibia (formerly the Academy for Tertiary Education) offers post-secondary education.

Land and climate. Namibia is bordered on the north by two large rivers, the Kunene and the Okavango. The Kwando River cuts through the Caprivi Strip. The Zambezi River flows along the northeastern border, and the Orange River forms Namibia's southern border. Otherwise, Namibia is a dry land. Droughts often occur.

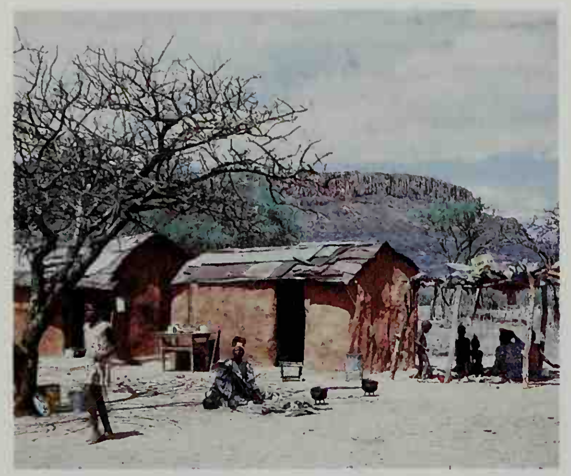
The western border of Namibia stretches 950 miles (1,500 kilometers) along the Atlantic Ocean. Huge sand dunes of the Namib Desert lie near the coast. The Kalahari Desert occupies eastern Namibia. The inland territory is mostly a rolling plain about 4,000 feet (1,200 meters) above sea level. This area has stubby trees and enough grassland for grazing cattle and growing corn.

Large antelope live on the interior plain of Namibia. Elephants adapted to desert conditions inhabit the northwest corner of the country. Etosha Game Park, which is a huge reserve in north-central Namibia, has a variety of animals, including antelopes, cheetahs, elephants, giraffes, lions, rhinoceroses, and zebras.

Daytime temperatures in Namibia average 75 °F (24 °C) in January and 68 °F (20 °C) in June. Namibia receives most of its rain between December and March. The average annual rainfall totals about 20 inches (50 centimeters) in the north and about 8 to 16 inches (20 to 40 centimeters) in the center. The south receives only about 1 to 6 inches (2.5 to 15 centimeters) of rain a year.

Economy. Mining ranks as Namibia's most important economic activity. The chief minerals are diamonds, uranium, copper, lead, tin, and zinc. Traditionally, farming, livestock raising, and fishing have also been important economic activities. But drought and other problems have reduced farming and livestock activities, and overfishing has reduced fishing in the Atlantic. Most farmers grow only enough food crops for their own use. The chief farm crops include corn, millet, and vegetables. Cattle and sheep are the most important livestock. The fishing industry yields anchovies, mackerel, and sardines. Little manufacturing takes place in Namibia.

Namibia's leading exports include jewelry diamonds, uranium oxide, copper, lead, and zinc. Imports include wheat and other foods, as well as manufactured products. The chief trading partners include South Africa, Japan, the United States, and the United Kingdom.



Walvis Bay is the chief port. Namibia has about 1,450 miles (2,330 kilometers) of railroads that connect its major urban areas with one another and with South Africa. Namibia also has about 24,000 miles (38,600 kilometers) of roads, fewer than one-fourth of which are paved. An international airport is near Windhoek.

History. Both the Damara and the San people claim to be the original inhabitants of Namibia. Through the years, large numbers of Herero and Ovambo people moved to Namibia from the north. By the 1800's, the Damara, Herero, and Ovambo were the largest groups, and the Kavango and the Caprivians had settled where they now live. Other groups arrived in the 1800's.

Herero women wear brightly colored clothing. The unusual hats, wide blouses, and hoop skirts are based on clothing given to the women by German Lutheran missionaries in the 1800's.

Edward S. Ross

Rural villages like the one shown here dot Namibia's landscape. Namibia's mostly dry land yields barely enough food for the people, but it provides valuable minerals.

Beginning in 1868, German settlers, missionaries, and soldiers colonized Namibia's coast. Germany annexed the land in 1884, calling it German Southwest Africa. In the 1890's, the Germans brutally forced the Herero and Damara out of the Windhoek area. The Herero began to revolt in 1904. By the time the Germans put down the revolt in 1907, they had killed about 65,000 Herero.

In 1915, during World War I, South African troops attacked the Germans and took over Namibia. The South Africans wanted to make Namibia part of their country. But the United States and other allied nations objected to that plan. In 1920, the newly formed League of Nations gave South Africa a mandate to manage Namibia's government and affairs. Yet, the South Africans governed Namibia as if it were a province of their nation.

The UN replaced the League of Nations in 1945. But South Africa refused to accept the authority of the UN and rejected its request to place Namibia under UN trusteeship. The UN took steps to try to bring Namibia under UN control. In 1966, the UN voted to end South Africa's mandate. In 1971, the International Court of Justice declared South Africa's control of Namibia illegal.

Black Namibians formed a political organization called the South West Africa People's Organization (SWAPO) in 1960. At first, SWAPO tried to persuade South Africa to grant Namibia independence. But beginning in the mid-1960's, it used guerrilla tactics to further its goal. In turn, South Africa set up armed forces along Namibia's borders with Angola and Zambia. Fighting occurred between SWAPO and South Africa until 1989.

In 1977, South Africa was preparing to grant Namibia independence under a plan that would give local political leadership to an assembly dominated by white Namibians. The UN strongly opposed such white domination. Representatives of the United States, the United Kingdom, West Germany, France, and Canada persuaded South Africa to negotiate a new plan that would meet the UN objection. Negotiations for independence were held at various times in the late 1970's and the 1980's.

Finally, in late 1988, South Africa agreed to a plan under which Namibia would gain full independence by April 1990. In April 1989, SWAPO and South Africa agreed to a cease-fire. Elections for a Constituent Assembly in Namibia were held in November 1989. In February 1990, the Assembly approved a constitution and elected Sam Nujoma, the leader of SWAPO, as Namibia's first president. Future presidents were to be elected by the people. Namibia gained independence on March 21, 1990. The Constituent Assembly was then renamed the National Assembly.

When Namibia became independent, South Africa kept the district of Walvis Bay, which included the major port of Walvis Bay. Namibian leaders said Walvis Bay should be part of Namibia. In March 1994, South Africa turned over control of Walvis Bay to Namibia. In 1994 and 1999, Namibia's voters reelected Nujoma as president. Robert I. Rotberg

Nan-ching. See Nanjing.

Nancy, *NAN see* or *nahn SEE* (pop. 105,830; met. area pop. 331,363), is a city in northeastern France. It lies on the Meurthe River, 6 miles (10 kilometers) north of the Meurthe's junction with the Moselle River. For location, see **France** (political map). Nancy is the commercial center of the Lorraine region. Factories in the city produce furniture, glassware, and electrical equipment. The city has a university, founded in 1572, and a school of forestry and mining. William M. Reddy

Nanjing, *nahn jihng* (pop. 2,610,594), also spelled *Nanching* or *Nanking,* is an important center of industry, transportation, and government in east-central China. The city lies on the Yangtze River, about 200 miles (320 kilometers) from the East China Sea. For location, see **China** (political map). Nanjing is the capital of Jiangsu Province and was once the capital of all China.

The city. Government office buildings, two museums, and a stadium are in the center of Nanjing. Commercial and residential areas lie outside the central area. Most of Nanjing's people live in apartment buildings or in apartments above shops. The remains of an ancient defensive wall surround the built-up areas of Nanjing.

Most of Nanjing's people travel by bicycle or public bus. Trucks transport most products in the city, but some goods travel in carts pulled by animals.

Wharves that can handle oceangoing ships line the banks of the Yangtze River, which borders Nanjing on the west. East of the city are Xwanwu Lake, a tourist attraction with several islands; and Zijin Mountain, the site of an astronomical observatory. The tomb of Sun Yat-sen, who helped establish the Republic of China in 1912, lies on the mountain. Nanjing's educational institutions include Nanjing University, engineering colleges, and a medical school.

Economy. Nanjing has hundreds of manufacturing plants. Leading products include cement, fertilizers, iron and steel, porcelain, textiles, and trucks. Nearby mines provide iron ore for the iron and steel plants. Several *communes* (farm communities) operate outside the city. The farmers raise cotton, rice, wheat, vegetables, and other crops.

Railroads connect Nanjing to Beijing, the capital of China, in the north and to Shanghai in the east. Numerous ships dock at the wharves of the city. A double-deck bridge that extends 3 miles (5 kilometers) across the

Mike Yamashita, Woodfin Camp, Inc.

The tomb of Sun Yat-sen lies on Zijin Mountain, east of Nanjing. Sun helped establish the Republic of China in 1912.

Yangtze River serves both trains and motor vehicles.

History. People have lived in what is now the Nanjing area since about the 400's B.C. Early settlers chose the site because of its location near a river and some roads. From A.D. 420 to 1421, the city served as the capital of various local Chinese *dynasties* (series of rulers of the same family). The Ming dynasty gained control of most of China in 1368. The first Ming ruler made Nanjing—which means *southern capital*—the seat of the dynasty. In the early 1400's, the Mings moved the capital to Beijing—which means *northern capital.*

In 1853, rebels called the Taipings seized Nanjing from the Manchus, who ruled China at that time. The Taipings made the city the capital of their empire. The Manchus regained Nanjing in 1864.

In 1912, Chinese revolutionaries overthrew the Manchus. The new rulers met in Nanjing and founded the Republic of China. From 1928 to 1937, the city served as the capital of the republic. Japanese forces captured Nanjing in 1937 and burned much of the city. Nanjing again became China's capital in 1946, the year after Japan's surrender ended World War II.

The Chinese Communists took over China in 1949. They made Beijing the capital, but Nanjing remained a center of regional government. During the 1950's, 1960's, and 1970's, the Communists built hundreds of manufacturing plants in Nanjing. The city quickly grew into a major industrial center. Parris H. Chang

Nanking. See Nanjing.

Nanking Massacre is a name for the brutality committed by Japanese troops against the people of Nanking (Nanjing), China, in 1937, during the Sino-Japanese War. The Sino-Japanese War led into, and became part of, World War II (1939-1945). Also called the Rape of Nanking, the massacre began on December 13—the day after the Japanese entered Nanking, at that time the capital of Nationalist China—and lasted for six weeks. During that period, Japanese forces engaged in widespread cruelty, rape, looting, arson, and murder of unarmed Chinese. Sometimes acting on orders, and often marauding in small groups, Japanese troops burst into businesses, private homes, and even areas under foreign protection to search for Chinese men of military age and for young women. Many of the men, and prisoners of war captured earlier, were gathered together and then murdered. Many women were raped by Japanese soldiers.

Experts disagree about the number of Chinese injured or killed by the Japanese during the Nanking Massacre. The full extent of this atrocity can never be determined precisely. At the time, the Japanese had no interest in counting the dead, and the Chinese had no way of accurately totaling up their losses. Neutral observers of many nationalities, shocked by what they witnessed, recorded the horrifying details in reports, letters, photographs, and even motion pictures. The death toll probably exceeded 100,000 at Nanking, though some estimates now place the figure as high as 300,000. Rapes of women may have numbered 20,000 or more. Many of these victims were then killed or died from their assaults.

The Nanking Massacre occupied a central place in Chinese efforts to win international support for their cause in the war against Japan. The Chinese stressed the cruel behavior of the Japanese invaders. The wartime Japanese government, in contrast, told its people only that the capture of Nanking, the enemy's capital and symbol of Nationalist China, was a grand achievement.

After the war, many Japanese were charged with war crimes and punished for the massacre after Chinese military trials were held. The International Military Tribunal for the Far East sentenced the Japanese commander at Nanking, General Matsui Iwane, to death. He was hanged on Dec. 23, 1948. Theodore F. Cook, Jr.

Nanotechnology, *NAN oh tehk NAHL uh jee,* is the precise manipulation of individual atoms and molecules to create larger structures. Nanotechnology involves engineering on the *nanometer* scale. *Nano* means *billionth.* A nanometer is 0.000000001 meter ($\frac{1}{25,400,000}$ inch)—approximately $\frac{1}{10,000}$ the width of a human hair or 3 to 5 times the diameter of a single atom. Nanotechnology is also called *molecular engineering* or *molecular manufacturing.*

The promise of nanotechnology. Many scientists and engineers believe that nanotechnology may someday create devices so small they could only be seen with powerful microscopes. Such devices might include supersensitive sensors that could detect single atoms of a contaminant or other substance. But the applications of nanotechnology are not restricted to creating tiny objects. Nanotechnology could also be used to make large objects, such as automobiles or computers, starting with building blocks the size of an atom or molecule.

The challenge of nanotechnology. One of the challenges of nanotechnology is to find a way to assemble things on a molecular scale. Scientists have manipulated individual atoms with a powerful microscope called a *scanning probe microscope.* This device uses a tiny probe to map out an object's surface at the atomic level. But the probe can also be used to pick up and arrange individual atoms or molecules. Manipulating atoms one by one is extremely time-consuming, however.

Another process, called *self-assembly,* may be a more effective method of creating nanoscale objects, also called *nanostructures.* Self-assembly is common in nature. It is the process, for example, by which an acorn grows into an oak tree rather than another plant. Scientists believe it may be possible for organic or biological

molecules to direct the self-assembly of nanostructures.

Types of nanostructures. Scientists have produced two kinds of nanostructures: (1) *nanocrystals* and (2) *nanotubes*. Nanocrystals are nanometer-sized clusters of atoms. They have unusual optical, electronic, and magnetic properties. For example, certain types of nanocrystals emit light when they absorb energy. But the color of light emitted depends on the size of the crystal.

Another type of nanocrystal has an unusual property related to its ability to *conduct* (carry) electric current. A sufficiently small sample of this nanocrystal can change from a metal—an excellent conductor—to an insulator. This change can occur at a constant temperature and pressure and without any change in the nanocrystal's chemical makeup.

Nanotubes are tubular structures of carbon atoms several nanometers in diameter and several thousand nanometers in length. Each nanotube is actually a single carbon molecule (see **Carbon** [Forms of carbon]). Nanotubes are about 100 times stronger than steel. Some serve as conductors, while others are insulators or *semiconductors*. A semiconductor is a material that conducts electric current better than an insulator but not as well as a conductor.

Nanometer-scale objects have physical and chemical properties distinct from those of larger objects of the same material. The properties of nanometer-scale objects change systematically and smoothly with size according to what are called *scaling laws*. Using these laws, engineers should be able to design advanced materials that act in various ways merely by changing the size of the components. Armand Paul Alivisatos

Nansen, *NAN suhn* or *NAHN suhn,* **Fridtjof,** *FRIHT yahf* (1861-1930), was a famous Norwegian polar explorer. He was also a humanitarian, a statesman, a marine zoologist, and a pioneer oceanographer.

Nansen made his first Arctic cruise in 1882 as a zoological collector aboard a whaler. In the summer of 1888, he and five other men made the first east-to-west crossing of the huge ice sheet that covers Greenland, a feat experts had declared impossible.

Nansen hoped to obtain valuable scientific information by exploring the North Polar Basin. For this expedition, he had a ship built to withstand the grinding ice floes. This ship was named the *Fram* (Forward). Nansen left Norway in the *Fram* on June 24, 1893. He deliberately let the ship become jammed in ice north of Siberia. For the next three years, the ice drift carried the ship across the Arctic Ocean to waters near Svalbard. In the second year, Nansen and Hjalmar Johansen left the *Fram* and tried to reach the North Pole with kayaks and sleds. They came within 272 miles (438 kilometers) of the pole, nearer than anyone before them. After meeting many dangers, they boarded a British ship at Franz Josef Land in 1896 and went to Norway. See **Arctic Ocean** (maps).

Nansen played a prominent part in the separation of Norway from Sweden in 1905. From 1906 to 1908, he served as Norwegian minister to the United Kingdom. When he returned to Norway, he became a professor of marine zoology (later oceanography) at the University of Christiania. He went on ocean voyages in 1910, 1912, 1913, and 1914, and published his results in many books. His writings include *Farthest North* (1897) and *In Northern Mists* (1911).

After World War I, Nansen was Norway's delegate to the League of Nations. He aided Soviet refugees in Asia Minor and directed the return of German and Soviet war prisoners to their homelands. He devised the *Nansen passport*—an identification certificate for refugees. He received the 1922 Nobel Peace Prize for his services. Oceanographers use a metal container, called a Nansen bottle in honor of him, to trap seawater. Nansen was born on Oct. 10, 1861, in Christiania (now Oslo).

William Barr

Nantes, *nants* or *nahnt* (pop. 277,728; met. area pop. 544,932), is a port city in western France, near the mouth of the Loire River (see **France** [political map]). A ship canal connects the city with the port of St.-Nazaire on the Bay of Biscay, an arm of the Atlantic Ocean. Shipping and shipbuilding are the major industries of Nantes. Other economic activities include food processing and the production of copper, steel, and aviation and railroad equipment. The city is the capital of the Loire region and the Loire-Atlantique *department* (administrative district). Landmarks include a castle, built in its present form in the 1400's, and the Cathedral of St. Peter and St. Paul, which also dates from the 1400's.

Gauls built a town on the site of what is now Nantes many years before Roman soldiers established a settlement nearby in the 50's B.C. In A.D. 1598, King Henry IV of France signed the famous Edict of Nantes in the city's castle. The edict granted limited religious liberty to Protestants (see **Nantes, Edict of**). Mark Kesselman

Nantes, *nants* or *nahnt,* **Edict of,** was the first official recognition of religious toleration by a great European country. King Henry IV of France signed the edict in the city of Nantes on April 13, 1598. Before the edict was signed, there had been 50 years of internal warfare and religious division in France.

The edict allowed French Protestants, called Huguenots, control of about 100 fortified towns for 8 years. They were also given freedom of conscience, social and political equality with the Roman Catholic majority, and a certain degree of freedom of worship. The edict was seriously enforced only until the king's death in 1610. It was revoked by King Louis XIV in 1685. As a result, about 200,000 Huguenots left France. Dale A. Johnson

See also **Huguenots; Henry IV** (of France).

Nantucket, *nan TUHK uht* (pop. 9,520), is a summer resort on Nantucket Island, off the southern coast of Cape Cod, Massachusetts (see **Massachusetts** [political map]). The name was taken from the Indian word *Nanticut,* meaning *The Faraway Land.* There are many summer homes in Nantucket because of the scenery and mild climate. Nantucket's beaches, bike paths, shops, and restaurants also attract tourists.

During the late 1700's, Nantucket became one of the greatest whaling centers in the world. As many as 125 whaling ships had their home port there. Charles I of England granted Nantucket Island to his brother the Duke of York in 1641. The island belonged to the province of New York from 1660 to 1692, when it became a part of Massachusetts. Laurence A. Lewis

Napalm, *NAY pahm,* is a powder used to thicken gasoline for use in war. When napalm is added to gasoline, the result is a jellied gasoline often called *napalm.*

A napalm bomb dropped from the air bursts, ignites, and splatters burning napalm over a wide area. The jel-

lied gasoline clings to everything it touches, and burns violently. Napalm causes death from burns or suffocation. Napalm is also used in flame throwers carried by ground troops (see **Flame thrower**). Napalm was used in World War II (1939-1945), the Korean War (1950-1953), the Vietnam War (1957-1975), and the Persian Gulf War (1991). Frances M. Lussier

Naphtha, *NAP thuh* or *NAF thuh,* is any liquid composed only of hydrogen and carbon that boils below 450 °F (233 °C). Naphthas obtained during the refining of petroleum are blended to make gasoline. Some types of naphtha are used to dissolve rubber and to thin paints and varnish. Others are used as a cleaning agent and as an ingredient in the manufacture of artificial gas.

Naphtha can also be made when coal tar, a sticky substance made from soft coal, is distilled. Coal tar naphtha is used as a dissolving agent. It is also used in *synthetic* (artificial) resins. Pure naphtha is highly explosive when exposed to an open flame. Geoffrey E. Dolbear

Napier, *NAY pee uhr* or *nuh PEER,* **John** (1550-1617), Laird of Merchiston, was a Scottish mathematician. He developed methods of rapid calculation, which he sought to apply to astronomy, trigonometry, navigation, mapmaking, and surveying. Napier discovered how to multiply numbers by doing the easier task of adding other, corresponding numbers that he called *logarithms* (see **Logarithms**). Logarithms are used to describe mathematically many natural phenomena. Napier also invented a set of "rods" or "bones" that could be arranged for arithmetical calculations. He was born near Edinburgh, Scotland. Judith V. Grabiner

Naples, *NAY puhlz* (pop. 1,067,365), is the third largest city of Italy. Only Rome and Milan are larger. Naples lies at the foot of a range of low hills on the west coast of southern Italy. For location, see **Italy** (political map).

Naples ranks as a major manufacturing center, and the Bay of Naples makes it an important seaport. Tourists come from all parts of the world to see the many places of scenic and historical interest in the Naples area. The city's name in Italian is *Napoli.*

About 600 B.C., Greek colonists from Cumae, 14 miles (23 kilometers) to the west, founded a town near the site of present-day Naples. They called the town Parthenope and later renamed it *Neapolis* (New City). The people of Naples are still called Neapolitans. During much of the period from the 1100's until 1860, Naples was the capital of a kingdom. This kingdom included most of southern Italy and the island of Sicily. Since 1861, the city has been the capital of Campania, a political region of Italy.

The city. In the eastern section of Naples, church spires rise above old tenement buildings and factories. The Spacca-Napoli district, with its crowded, narrow streets, forms the heart of old Naples. The newer western part of the city lies along the Riviera di Chiaia, a broad drive that runs along the Bay of Naples. A hilly, densely populated modern section called the Vomero lies inland.

The Cathedral of St. Januarius, completed in 1323, honors Naples's patron saint. Castles in the city now house museum collections or government offices. The oldest of these structures, the Castel dell'Ovo (Castle of the Egg), takes its name from its shape. The Castel Sant'Elmo, built in the 1300's and enlarged in the 1500's, served as a prison for many years. The city's attractions also include a botanical garden and a public park. The park has one of Europe's finest aquariums.

Naples lies amid some of the most spectacular scenery in Europe. Artists from many countries go there to paint the landscape or the people. Mount Vesuvius, the only active volcano on the mainland of Europe, rises 7 miles (11 kilometers) southeast of the city. It erupted in A.D. 79, burying the ancient Roman cities of Pompeii and Herculaneum, which are within 20 miles (32 kilometers) of Naples. The ruins of these cities are important archaeological sites for the study of life in Roman times. Capri and Ischia, islands famous for their pleasant climate and scenic beauty, lie to the south across the Bay of Naples. Vineyards and citrus groves dot the hillsides on the bay's eastern shore. Just west of Naples, the Posillipo district offers a lovely view of the Bay of Naples.

Way of life. Music plays an important part in Neapolitan life. Such songs as "O Sole Mio," "Funiculi, Funicula," and "Santa Lucia" have made the city's music familiar in many parts of the world. At the Piedigrotta, an annual music festival, the people hold an outdoor competition to choose the best of the new popular songs. The Teatro San Carlo, one of the largest opera houses in Italy, has presented the first performance of many famous operas.

G. Barone from Madeline Grimoldi

Naples lies at the foot of low hills along the beautiful Bay of Naples. Volcanic Mount Vesuvius, *rear,* adds to the city's scenic beauty. Naples is a leading Italian port and manufacturing center.

Neapolitan food includes many varieties of dishes made with spaghetti, macaroni, or other pasta. Naples is the birthplace of pizza, which a baker invented in 1889 to honor the queen of Italy. Neapolitans also eat much fish and other seafood.

The National Archaeological Museum in Naples displays one of the world's largest collections of ancient art objects. The collection includes glassware, mosaics, paintings, pottery, and statues from Herculaneum and Pompeii; and ancient Greek sculpture. The royal palace of Capodimonte, built in the 1700's as a residence for the kings of Naples, houses the National Gallery. The gallery owns a collection of paintings, porcelain, sculpture, and tapestries. The National Library is the largest of the city's several libraries. It holds thousands of rare manuscripts. The Carthusian monastery of St. Martin, which adjoins the Castel Sant'Elmo, features a museum collection devoted to the art and history of Naples. The University of Naples, the best known of the city's many schools and colleges, was founded in 1224 by Emperor Frederick II.

Economy. Products manufactured in Naples include automobiles, cement, chemical products, locomotives, office machinery, ships, and textiles. The highly industrialized area in and around the city has the greatest concentration of factories in southern Italy. Ships from every part of the world use Naples's harbor. Naples still produces many traditional wares for which it became known through the years. They include kidskin gloves, wine, and articles made of coral and tortoise shell, such as combs and jewelry. Despite its industries, Naples suffers from a high rate of unemployment.

History. After more than a century as a Greek colony, Naples came under Roman control about 326 B.C. The city's beauty and mild climate made it a favorite resort of wealthy Romans. The poet Virgil lived in Naples for more than 20 years and is buried on a nearby hill.

After the fall of the Roman Empire in A.D. 476, various peoples fought for control of Naples and the rest of southern Italy. The Byzantines, Franks, Lombards, Normans, and Germans controlled the city for periods during the Middle Ages. Naples came under Spanish rule in 1442, and Spain held it for most of the next 250 years.

Austria ruled Naples in the early 1700's. During this period, Naples was Italy's largest city and one of the largest cities of Europe. In 1734, the city became the capital of an independent kingdom, which was also called Naples. A Spanish branch of the royal Bourbon family governed this kingdom and Sicily. During the Napoleonic Wars (1799-1814), Naples had a series of French rulers, including Napoleon's brother, Joseph Bonaparte. The Bourbons regained power in 1815. In 1816, they formally combined Naples and Sicily to form the Kingdom of the Two Sicilies, which they ruled until 1860. In 1861, the Kingdom of the Two Sicilies became part of the newly formed kingdom of Italy.

During World War II (1939-1945), bombs destroyed many buildings in central Naples and the port area. The damaged areas were rebuilt, but a housing shortage remained. In the 1970's, the Italian government began working to relieve the shortage. In 1980, however, a severe earthquake destroyed many buildings in Naples. During the 1980's, the government provided new housing outside the city. In the 1990's, the city administration helped to modernize Naples by enlarging the airport, improving public transportation, and extending hours at museums and galleries. John A. Davis

Naples, Bay of, is an inlet of the Tyrrhenian Sea on the southwest coast of Italy near the city of Naples. The bay lies between Cape Miseno and the Isle of Ischia on the north and the Sorrento Peninsula and the Isle of Capri on the south. Mount Vesuvius, an active volcano, rises adjacent to the bay near Naples. The bay is famous for the beauty of its coastline and its deep blue waters. The waters near Naples are polluted. The southern shores of the bay have many tourist resorts. See also Naples (picture). Howell C. Lloyd

Napoleon I (1769-1821), also known as Napoleon Bonaparte, crowned himself emperor of the French. He was the greatest military genius of his time and perhaps the greatest general in history. He created an empire that covered most of western and central Europe.

Napoleon was also an excellent administrator. He introduced many useful reforms, including the creation of a strong, efficient central government and the revision and organization of French laws into collections called *codes.* Many of his reforms are evident today in the in-

National Gallery of Art, Washington, D.C.; Samuel H. Kress Collection (photo by Lyle Peterzell)

Napoleon I posed in his study for French painter Jacques Louis David in 1812. David served as court painter to the emperor.

stitutions of France and of areas once under its control.

Napoleon stood 5 feet 2 inches (157 centimeters) tall, about average for Frenchmen of his time, though most French generals and statesmen were taller. He earned the nickname *le Petit Caporal* (the little corporal) in 1796 at the Battle of Lodi, near Milan, Italy. In the battle, General Bonaparte startled his troops by personally aiming the cannon, a risky job usually performed by a corporal.

Napoleon was an inspirational and dramatic leader. He could also be cynical and demanding, though this side of his character was usually hidden from the public. In addition, Napoleon had great energy and ambition. He personally directed complex military maneuvers and at the same time controlled France's press, police system, foreign policy, and domestic affairs. He chose capable subordinates and rewarded them generously with medals, wealth, military rank, and titles of nobility.

Napoleon's ambition ultimately led him to overextend his power. His downfall also resulted in part from feelings of nationalism in areas invaded by French troops and from economic hardship brought on by Napoleon's attempts to exclude British goods from continental Europe. Other factors that contributed to his downfall included bitter reaction to the taxes and *conscription* (the draft) that he imposed across his empire and opposition to Napoleon of many of Europe's royal rulers.

Boyhood. Napoleon was born on Aug. 15, 1769, in Ajaccio, on the island of Corsica in the Mediterranean Sea. The year before his birth, France had bought Corsica from the Italian city-state of Genoa. Napoleon was the fourth child and second son of Carlo and Letizia Ramolino Buonaparte (later given the French spelling Bonaparte). Napoleon's parents were members of noble Italian families. Carlo Buonaparte was an eloquent lawyer and a prominent citizen of Corsica. Napoleon's mother was beautiful and strong-willed.

In 1779, at the age of 9, Napoleon entered a French military school at Brienne-le-Château, a town in France near Troyes. Napoleon was an average student in most subjects, but he excelled in mathematics. In 1784, he was selected for the elite military academy *École Militaire* in Paris, from which he graduated a year later.

Early military career. In January 1785, at the age of 16, Napoleon received a commission in the French Army, as a second lieutenant of artillery. He joined an artillery regiment and briefly attended the royal artillery school in Auxonne, near Dole. He was promoted to first lieutenant in 1791 and to captain in 1792.

The French Revolution broke out in 1789 (see **French Revolution**). During the early 1790's, Napoleon spent many months in Corsica on leave from the French Army. While there, he served in the Corsican National Guard. But in France, he joined a radical political society known as the *Jacobins*. Many Jacobins wanted to make France a democratic republic. Napoleon's membership in the society brought him into conflict with the governor of Corsica, Pasquale Paoli, who was a *royalist* (supporter of the French monarchy). After the revolutionary French government executed King Louis XVI in January 1793, Paoli declared the Bonapartes outlaws, and the family fled to France. Napoleon then returned to the French Army.

In June 1793, a group of Jacobins led by Maximilien Robespierre gained control of the French government (see **Robespierre**). Several French cities revolted against Robespierre's regime. At Toulon, the rebels were aided by a British naval fleet. When the French artillery commander at Toulon was wounded, Napoleon was sent to take his place. In December 1793, Napoleon positioned the artillery on high ground overlooking the harbor at Toulon and fired down on the British ships. The fleet withdrew and French troops gained control of Toulon. For his role in the victory, Napoleon was named brigadier general at the age of 24.

Napoleon's star had risen, but soon seemed about to set. In July 1794, Robespierre fell from power and was executed. In August, Napoleon was imprisoned for about a week. After his release, he returned to the army.

The "whiff of grapeshot." In 1795, Napoleon was in Paris when angry mobs there tried to attack the ruling National Convention at the royal palace called the Tuileries. The mobs had been encouraged by royalists who hoped to destroy the convention before it could install a new moderate government. The convention was protected by troops under Vicomte Paul de Barras. Barras had seen Napoleon in action at Toulon and now sent for him. Napoleon defended the palace with point-blank cannon fire. This cannon fire, which became known as the "whiff of grapeshot," killed or wounded hundreds of people and quickly cleared the streets. Napoleon was hailed as a hero and promoted to major general. The new government, called the Directory, was installed with Barras as one of its five directors.

Marriage. In 1796, Napoleon married Josephine de Beauharnais, a beautiful woman of French descent from Martinique in the West Indies. Josephine's first husband, Vicomte Alexandre de Beauharnais, had been sent to the guillotine during the Reign of Terror (see **French Revolution** [Terror and equality]). When Napoleon met her, Josephine was a leader of fashionable French society. She was six years older than Napoleon, and had two children by her previous marriage.

Rise to power

Victories in Italy. From 1792 to 1795, France had been at war with much of Europe. By 1796, Austria had become France's chief enemy. Days after marrying Josephine, Napoleon left Paris to take command of a French army on the Italian-French border—an underfed, ill-equipped force of about 38,000 men. The Directory

Important dates in Napoleon's life

1769 (Aug. 15)	Born at Ajaccio, Corsica.
1796 (Mar. 9)	Married Josephine de Beauharnais.
1799 (Nov. 9)	Seized power in France.
1804 (Dec. 2)	Crowned himself emperor of the French.
1805 (Dec. 2)	Crushed the allied armies at Austerlitz.
1806 (July 12)	Set up the Confederation of the Rhine.
1806 (Oct. 14)	Defeated the Prussians at Jena and Auerstedt.
1807 (June 14)	Overwhelmed the Russians at Friedland.
1809 (July 5-6)	Defeated Austrians at Wagram.
1810 (Apr. 2)	Married Marie Louise of Austria.
1812 (Sept. 14)	Occupied Moscow.
1814 (Apr. 11)	Abdicated his throne.
1814 (May 4)	Exiled and arrived on Elba.
1815 (Mar. 20)	Returned to power in France.
1815 (June 18)	Defeated in the Battle of Waterloo.
1815 (Oct. 16)	Exiled to St. Helena.
1821 (May 5)	Died at Longwood on St. Helena.

hoped that he could tie up Austrian forces in Italy while larger French armies won the war by marching through Germany and attacking Vienna, Austria's capital.

Instead, Napoleon won the war. In less than a year, he defeated four armies, each larger than his own. He won a final victory by marching over the Alps and threatening Vienna in early 1797. In October, France and Austria signed the Treaty of Campoformio, which enlarged France's territory. Napoleon returned to Paris, where once again he was hailed as a hero.

Military strategy. Napoleon had by now developed a highly successful military strategy that was to form the basis of his future campaigns. He would start a battle while holding back as large a reserve as possible. He would then seek the weakest point in the enemy's lines and throw all his strength against that point at the decisive moment. Napoleon had an extraordinary ability to recognize the best time to attack.

Egypt invaded. When Napoleon returned to Paris after defeating Austria, he already had political ambitions. However, he felt that he did not yet have enough influence to gain control of the government. Instead, he concentrated on strengthening his military reputation. Late in 1797, the Directory offered to put Napoleon at the head of an invasion of England. But he declined the offer. Instead, he proposed that he invade Egypt to destroy British trade with the Middle East. The Directory agreed to the plan. In May 1798, Napoleon sailed for Egypt with about 38,000 men.

Napoleon reached Egypt in July. There, he defeated the Mamelukes, Egypt's military rulers, in the Battle of the Pyramids near Cairo (see **Mamelukes**). On August 1, however, the French fleet anchored in Abu Qir Bay was destroyed in the Battle of the Nile by a British fleet commanded by Lord Horatio Nelson. As a result, Napoleon's army was stranded in Egypt. Turkey then formed an alliance with Great Britain and Russia and declared war on France. In 1799, Napoleon's troops invaded Turkish Syria and advanced as far as the fortress Acre (now Akko, Israel), which Napoleon failed to capture. Meanwhile, Napoleon learned that a Turkish army was preparing to invade Egypt. He retreated to Egypt, where he met and defeated the Turks at Abu Qir, near Abu Qir Bay. About this time, Napoleon learned that Austria, Britain, and Russia had formed a coalition against France and had defeated the French army in Italy. He left his army in the command of General Jean Kléber and sailed for France.

First consul of France

News of Napoleon's victory at Abu Qir arrived with him in Paris. The French people, who had lost confidence in the Directory, cheered the return of the young hero. Napoleon formed key political alliances and seized control of the French government on Nov. 9, 1799, in a bold move known as the *Coup d'État of Eighteenth Brumaire.* A new constitution overwhelmingly approved by the French people replaced the Directory with a three-member *Consulate.* Napoleon became first consul. The other two consuls served merely as advisers to Napoleon. After 10 years of revolution and civil disorder, the French wanted a strong leader. Napoleon could now rule France as a dictator.

Peacemaking. As first consul, Napoleon sought peace. In May 1800, he led a famous march across the Alps, through the Great St. Bernard Pass and into the Po Valley of northern Italy. In June, his army surprised and defeated the Austrians in the Battle of Marengo. In 1801, the Austrians signed the Treaty of Lunéville, which reaffirmed the Treaty of Campoformio. With Austria defeated, the war-weary British agreed to peace in 1802 in the Treaty of Amiens. Russia had dropped out of the coalition against France in 1799. For the first time in 10 years, Europe was at peace.

Administrator and lawmaker. Napoleon proved to be a superb civil administrator. One of his greatest achievements was his supervision of the revision and collection of French law into codes. The new law codes—seven in number—incorporated some of the freedoms gained by the people of France during the French Revolution, including religious toleration and the abolition of serfdom. The most famous of the codes, the *Code Napoléon* or *Code Civil,* still forms the basis of French civil law (see **Code Napoléon**). Napoleon also centralized France's government by appointing *prefects* to administer regions called *departments,* into which France was divided.

The Napoleonic empire

French aggression. Napoleon was not content simply to govern France. His thoughts soon turned to conquest. At first, he sought to extend French influence in the Western Hemisphere. In 1800, Napoleon forced Spain to cede to France the Louisiana Territory in North America. But the army that he sent to take possession of the territory was destroyed in the French colony of Haiti by a slave revolt and by tropical disease. Frustrated, Napoleon abandoned his plans for the Western Hemisphere and turned his attention to Europe. By 1803, France had annexed the Piedmont region of northwestern Italy and Napoleon had become president of the Italian Republic, which bordered Piedmont on the east. Also, fearful of Britain's naval power, Napoleon had tried to stop British trade with the rest of Europe. He anticipated war with Britain and in 1803 sold the Louisiana Territory to the United States to raise money for the war. War with Britain began later that year.

Crowned emperor. In 1802, the French people had overwhelmingly approved a constitutional amendment that made Napoleon first consul for life. In May 1804, the French Senate and people voted him their emperor. Napoleon crowned himself emperor on December 2 in ceremonies at the Cathedral of Notre Dame in Paris.

Dominates Europe. By 1805, Austria, Russia, and Sweden had joined Britain in a new coalition against France. In September 1805, Napoleon led his troops into Germany. In October, he captured an Austrian army at Ulm. In December, he demolished the Austrian and Russian armies at Austerlitz. But earlier that year Lord Nelson had destroyed the fleets of France and Spain, France's ally, near Trafalgar, a cape on Spain's southern coast. This victory gave Britain control of the seas and ended any chance of Napoleon's invading Britain.

In 1806, Prussia joined Russia in mounting a new campaign against France. In October, Napoleon's forces overwhelmed the Prussian army at Jena and at nearby Auerstedt. In June 1807, Napoleon demolished Russian armies at Friedland. In 1809, he defeated the Austrians again at Wagram, near Vienna.

The empire of Napoleon I Napoleon became the ruler of France in 1799. By 1812, his empire covered most of Europe. Napoleon was defeated at Leipzig in 1813 and was forced to give up the French throne in 1814. He later formed another army but was defeated at Waterloo in 1815. The map shows his major battles.

WORLD BOOK map

After each victory, Napoleon enlarged his empire. In 1806, he set up the Confederation of the Rhine, made up of a number of western German states, and placed it under his protection. He also carved provinces of Germany and Italy into principalities and dukedoms, and gave them to friends and relatives. In 1806, he made his brother Joseph king of Naples, and his brother Louis king of Holland. In 1807, Napoleon made his brother Jerome king of Westphalia and added to France the Grand Duchy of Warsaw. In 1809, he gave his sister Elisa the Grand Duchy of Tuscany and annexed to France the Illyrian Provinces, which covered much of what are now Slovenia and Croatia. In 1810, he brought his empire to its height by annexing Holland and much of Germany.

Divorce and remarriage. By 1809, Napoleon had grown concerned about what would become of his vast empire after his death. Josephine, who was now 46 years old, had no children by him, and Napoleon had no heirs. In December, he divorced Josephine to marry a younger woman. In April 1810, he married the 18-year-old Archduchess Marie Louise, daughter of Emperor Francis I of Austria. In 1811, the couple had a son, also named Napoleon, who was given the title king of Rome.

Fall from power

In 1806, Napoleon had issued the Berlin Decree, which barred British ships from ports under French control. The decree was aimed at destroying British trade with continental Europe. In 1807, Napoleon issued the Milan Decree, which was intended to prevent the ships of neutral nations from carrying British goods to continental Europe. Such ships were attacked by French vessels. The system established by the Berlin and Milan decrees for blocking British trade was known as the Continental System.

Portugal, which had long been friendly with Great Britain, refused to follow the Berlin Decree. In 1807, the French gained control of Portugal and occupied parts of

Spain. In 1808, French forces under Marshal Joachim Murat seized control of Madrid, Spain's capital. Napoleon removed King Ferdinand VII from the Spanish throne and appointed his brother Joseph king of Spain. Murat took Joseph's place as king of Naples.

The Peninsular War began in 1808 when Spanish and Portuguese forces rebelled against French rule. Soon after the war began, British troops joined the fight against France on the peninsula that consisted of Portugal and Spain. By April 1814, all French forces had been driven from the peninsula. Tens of thousands of French soldiers died in the war, and the loss of Spain and Portugal greatly damaged Napoleon's prestige.

Disaster in Russia. On Dec. 31, 1810, Czar Alexander I of Russia withdrew from the Continental System. Napoleon felt that the czar's withdrawal threatened France, and so he assembled a new army to attack Russia. Many years of war had weakened France, but Napoleon raised about 600,000 men. His allies and subject nations furnished by conscription many of these soldiers. The Russian army had about 200,000 men.

In June 1812, Napoleon's army crossed the Neman River into Russia. The Russians retreated, denying Napoleon a decisive battle. In September, Napoleon fought the Russians at Borodino, near Moscow. The battle resulted in many casualties on both sides but produced no clear winner. Again, the Russians withdrew.

Napoleon pushed on to Moscow only to find the city nearly empty of people. Soon after the French army entered Moscow, large parts of the city were destroyed by fires that had been set by the retreating Russians. With the bitter Russian winter approaching, Napoleon waited in Moscow for Alexander to offer peace, but no such offer came. In mid-October, Napoleon, unable to supply his troops, began the long retreat from Moscow. His soldiers struggled against snowstorms and freezing temperatures. Soldiers and horses died of starvation and exposure. Russian soldiers called Cossacks killed many of the stragglers. Of the 600,000 men in Napoleon's army, about 500,000 died, deserted, or were captured during the campaign and the retreat from Russia.

After he returned to Paris, Napoleon admitted the disaster in his famous *29th Bulletin.* The French continued to support him, but news of the devastating campaign encouraged his enemies throughout Europe.

The enemy alliance. After his return from Moscow, Napoleon faced a hostile alliance of Austria, Britain, Russia, Prussia, and Sweden. In April 1813, Napoleon arrived in Germany with a new army and took the offensive against the allies. He won initial victories at Lützen, Bautzen, and Dresden, but his forces were vastly outnumbered. In October, the two sides fought at Leipzig in the Battle of the Nations. In the battle, Napoleon was defeated, and he retreated into France. The allies pursued him and captured Paris in March 1814.

Exile to Elba. At Fontainebleau on April 11, 1814, Napoleon *abdicated* (gave up) the imperial throne. The allies called for the return of a king of the Bourbon family and placed Louis XVIII, the brother of Louis XVI, on the French throne (see **Louis XVIII**). Napoleon was exiled from France and made ruler of the tiny island of Elba off the northwest coast of Italy. His wife and son were sent to his wife's father, the emperor of Austria. Napoleon never saw his wife or son again.

On Elba, Napoleon planned his return to France. In February 1815, he sailed from the island with about 1,100 followers who had shared his exile. He landed at Cannes on March 1 and began marching to Paris, gathering supporters along the way. Troops led by Marshal Michel Ney were dispatched from Paris to arrest Napoleon. But when they saw their old leader, the men gladly joined him and hailed him as their emperor. Louis XVIII fled Paris as Napoleon approached. On March 20, Napoleon entered Paris and was carried on the shoulders of cheering crowds into the Tuileries.

The Hundred Days and Waterloo. Napoleon immediately proclaimed a new constitution that limited his powers. He promised the allies that he would not make war. But the allied leaders considered Napoleon an "enemy and disturber of the peace of the world." Once again, both sides prepared for battle.

Napoleon advanced into Belgium with about 125,000 men, hoping to defeat the separate armies of Britain's Duke of Wellington and the Prussian Marshal Gebhard von Blücher. On June 16, Napoleon defeated Blücher at Ligny, near Fleurus. On June 18, Napoleon attacked Wellington at Waterloo in what has become one of history's most famous battles. The battle featured spectacular charges by thousands of French cavalry. But just as it seemed the British forces would collapse, Blücher's troops arrived to reinforce Wellington. Badly outnumbered, the French army suffered a crushing defeat.

Napoleon fled to Paris and abdicated for the second time, on June 22. The period from Napoleon's return to Paris from Elba to his second abdication is known as *the Hundred Days.* Napoleon tried to escape to the United States, but he failed and surrendered at Rochefort to Frederick Lewis Maitland, the captain of the British battleship *Bellerophon.* In August, Napoleon was sent to the barren British island of St. Helena, in the South Atlantic Ocean (see **Atlantic Ocean** [map]).

On St. Helena, Napoleon spent much of his remaining years dictating to friends his version of the events that occurred during his lifetime. He died on May 5, 1821, of a stomach ulcer that was probably cancerous. Most historians label as inaccurate a theory that he died of arsenic poisoning. Napoleon was buried on the island. In his will, Napoleon had asked to be buried "on the banks of the Seine, among the French people I have loved so much." In 1840, the British and French governments had his remains brought to Paris. There, at the Église du Dôme (Church of the Dome), which is part of the Hôtel des Invalides (Home for Disabled Soldiers), the body of Napoleon was laid to rest.

Napoleon's place in history

Napoleon is both a historical figure and a legend—and it is sometimes difficult to separate the two. The events of his life have fired the imaginations of great writers, filmmakers, and playwrights whose works have done much to create the Napoleonic legend.

Napoleon was one of the greatest military commanders in history. But he has also been portrayed as a power-hungry conqueror. He denied being such a conqueror. He argued that he had tried to build a federation of free peoples in a Europe united under a liberal government. He did intend, though, to achieve this goal by concentrating power in his own hands. However, in the

states he created, Napoleon granted constitutions, introduced law codes, abolished feudalism, created efficient governments, and fostered education, science, literature, and the arts. Owen Connelly

Napoleon II (1811-1832), Duke of Reichstadt, *RYKE shtaht,* was the son of Emperor Napoleon I of France and his second wife, Marie Louise of Austria. Napoleon I had long hoped for a son to inherit his empire, and he gave his newborn son the title of king of Rome.

When Napoleon I was overthrown in 1814, he gave up the throne in favor of his young son. But the French Senate did not recognize Napoleon II as emperor, and Louis XVIII, a member of the Bourbon royal family, became king of France that year. Marie Louise then took her son to live at the court of her father, Emperor Francis I of Austria. After Napoleon I was defeated at the Battle of Waterloo in 1815, he again proclaimed his son emperor of France. However, the French refused to give the young boy the throne, and he remained in Austria. His mother's family gave him the title of Duke of Reichstadt in 1818.

Napoleon II was never strong, and he grew into a tall, slender youth. He died of tuberculosis at the age of 21 and was buried in the Habsburg (or Hapsburg) family's church tomb in Vienna. In 1940, Adolf Hitler, dictator of Germany, had the body placed near that of Napoleon I in the Église du Dôme (Church of the Dome) at the Hôtel des Invalides (Home for Disabled Soldiers) in Paris. Napoleon II was born on March 12, 1811, in Paris.

Peter N. Stearns

Napoleon III (1808-1873) ruled as emperor of France from 1852 to 1870. His public works programs transformed Paris, but failures in foreign policy became his undoing.

Early life. He was born on April 20, 1808, in Paris, the son of Louis Bonaparte, king of Holland and brother of French Emperor Napoleon I. His full name was Charles Louis Napoleon Bonaparte, but he was usually called Louis Napoleon. A French law of 1816 exiled the Bonapartes from France, and Louis Napoleon spent his youth in Italy, Germany, and Switzerland. He became the head of his family in 1832. He was connected with such revolutionary groups as the *Carbonari* in Italy. He tried to overthrow the French monarchy of Louis Philippe in 1836 and 1840. He was imprisoned in the French fortress of Ham following the 1840 expedition. He escaped to England in 1846. During these years, he wrote his *Napoleonic Ideas* (1839), idealizing the career of his famous uncle, and *The Extinction of Poverty* (1844), proposing that the government act to end poverty and suffering.

Becomes emperor. When the Revolution of 1848 led to the Second Republic in France, Louis Napoleon returned and was elected to the Assembly. In December, benefiting by the glamour of his name, he was elected president by a large margin. He swore an oath to the republic, but in December 1851, he managed to concentrate all power in his hands. He abolished the republic and proclaimed himself emperor in 1852.

Napoleon's domestic policies were conflicting. He ruled as a dictator and was surrounded by dishonest adventurers. Although all men could vote, the legislature was powerless and the press could not publish legislative debates. When, after 1860, Napoleon moved in the direction of a liberal empire, it was too late. Liberal opponents continued to urge the overthrow of his government. Yet Napoleon keenly realized the problems of the industrial age. He favored state help for industries, banks, railroads, and the poor. He also backed major construction projects in Paris to modernize the city and to limit uprisings by the French people.

Foreign affairs. Napoleon tried to settle disputes

through international conferences, and he sympathized with claims of nationalism. He helped with independence for Romania, unification for Italy, and, unwittingly, unification for Germany.

Napoleon announced when he became emperor, "The Empire means peace," yet he led France into a long series of unfortunate adventures in other countries. In 1849, he helped overthrow the Roman Republic and restore the pope. He joined the United Kingdom and the Ottoman Empire in 1854 in the Crimean War against Russia. He secretly promised in 1859 to help the Count di Cavour drive the Austrians from Italy, in return for the promise of Nice and Savoy. But Napoleon withdrew from the war when he saw that Italy, instead of forming a weak confederation, would be united. He supported a scheme making Maximilian, the Archduke of Austria, emperor of Mexico in 1864. Napoleon hoped to increase French prestige, but United States pressure in 1867 forced him to withdraw his troops and leave Maximilian to be shot. Napoleon also supported French expeditions in central Africa and in what is today Vietnam.

His defeat. Otto von Bismarck, the prime minister of Prussia, wanted to unite Prussia and all the other German states into one country. Napoleon feared that a unified Germany would weaken France's power in Europe, and he hoped to keep Germany divided. Tensions between France and Prussia grew until they exploded in the Franco-Prussian war of 1870. France, however, was not prepared for war. The Germans easily defeated the French, seized territory in eastern France, and created the German Empire. Napoleon surrendered to the Germans at Sedan, France, on Sept. 2, 1870, with 80,000 troops. Two days later, supporters of a new French republic overthrew Napoleon's empire. Peter N. Stearns

Napoleonic Code. See Code Napoléon.

Narcissus, *nahr SIHS uhs,* is the name of a large group of early spring flowers with lovely blossoms. They grow from brown-coated bulbs. They were named for the legendary Greek youth Narcissus. Narcissuses are native to Europe and Asia, but many are cultivated in North America. People like them because they have fragrant and delicately fashioned blossoms of yellow, white, or sometimes pink or orange. The narcissus is a special flower of December. In Europe, in the springtime, fragrant masses of wild narcissuses cover the Alpine meadows. Narcissus bulbs are poisonous.

There are various types of narcissuses. All of them send up shoots with sword-shaped leaves. The flowers have six petals surrounding a trumpet- or cup-shaped tube, which may be long or short. Many botanists consider *daffodils* to be long-trumpet narcissuses. *Jonquils* are short-trumpet narcissuses. Gardeners usually plant narcissus bulbs in the fall. The flowers are perennial.

Another short-trumpet species is the *poet's narcissus.* It produces a single, wide-open blossom on each stalk. Generally, the blossom has white petals surrounding a short, yellowish cup with a crinkled red edge.

The *paperwhite narcissus* is a short-trumpet species that can be grown indoors in winter from bulbs placed on pebbles. Most cultivated types have large clusters of pure white flowers that are very heavily scented. When breeders cross the paperwhite narcissus with the poet's narcissus, they get improved varieties, including types with flowers of two different colors on the same plant. People value these beautiful hybrids.

WORLD BOOK illustration by Robert Hynes

The poet's narcissus has a single, wide-open blossom on each stalk. The blossom has a yellowish cup and white petals.

August A. De Hertogh

Scientific classification. Narcissuses belong to the amaryllis family, Amaryllidaceae. The daffodil is *Narcissus pseudo-narcissus.* The poet's narcissus is *N. poeticus;* the paperwhite is *N. tazetta.*

See also **Bulb; Daffodil; Jonquil.**

Narcissus, *nahr SIHS uhs,* in Greek mythology, was a handsome youth who was courted by many lovers for his beauty. He, however, haughtily rejected all of them, including the nymph Echo. As punishment for his cruelty, the gods condemned Narcissus to contemplate his beauty reflected in a pond on Mount Helicon in Greece. Day after day he lay beside the pond, gazing lovingly at his reflection until he wasted away and died. When searchers looked for him, they found only a flower, now called the narcissus. Echo also wasted away from her love for Narcissus, finally becoming nothing more than a voice in the woods. The best-known version of the Narcissus story appears in the *Metamorphoses,* a collection of tales by the Roman poet Ovid. Jon D. Mikalson

Narcolepsy, *NAHR kuh LEHP see,* is a disease that causes excessive sleepiness. People with narcolepsy tend to fall asleep several times a day, even though they get enough sleep at night. The exact cause of the disease is unknown, but much evidence indicates that it is hereditary. Doctors can treat narcolepsy with medication, but it cannot be cured.

Narcolepsy has several symptoms in addition to excessive sleepiness. Narcoleptics experience *episodes* (attacks) in which their muscles suddenly collapse though they remain awake. This condition is called *cataplexy.* Many cataplectic episodes are brought on by strong emotions, especially anger and laughter, and last two minutes or less. A person with narcolepsy may also experience *sleep paralysis* and *hypnagogic hallucinations.* In sleep paralysis, the person suddenly becomes unable to move as he or she is falling asleep or waking up. A person with hypnagogic hallucinations experiences vivid, realistic sights and sounds that do not really

exist as he or she falls asleep.

Scientists believe the symptoms of narcolepsy are related to *REM* (*R*apid *E*ye *M*ovement) sleep, the phase of sleep during which people dream. The eyes move rapidly in this phase, and the body is paralyzed while dreams occur. Narcoleptics experience this same sort of paralysis—while awake—during cataplectic episodes. They may feel tremendously tired during the daytime due to an unusual need for REM sleep. Ernest Hartmann

See also **Amphetamine** (Medical uses); **Cataplexy; Sleep.**

Narcotic is a substance that has a strong depressant effect upon the human nervous system. Narcotic substances cause insensibility to pain, stupor, sleep, or coma, according to the amount taken. The term *narcotic* comes from a Greek word meaning *to make numb.*

Narcotics include opium, codeine, morphine, and heroin. When a narcotic is given in doses large enough to cause sleep or coma, the drug is called a *hypnotic.* The term *analgesic* is applied to a drug that relieves pain without causing unconsciousness. The same narcotic may be either an analgesic or a hypnotic, depending on the dosage.

Narcotics produce an analgesic effect by interacting with specific nerve cells called *receptors* in the central nervous system. Several chemicals that occur naturally in the body, including *endorphins* and *enkephalins,* interact with the same receptors. Scientists believe these naturally occurring chemicals control the brain's perception of pain. See **Endorphin.**

Narcotic drugs are extremely useful in medicine, but they also have dangerous effects. Large doses of narcotics may cause death. The careless use of opium and substances made from it to relieve pain has frequently caused a drug habit. No one should use these and other narcotics except under the direction of a physician.

The United States carefully regulates the importation of narcotics as well as the manufacture and distribution of narcotic by-products. Physicians must state certain facts on narcotic prescriptions, and druggists must keep records of them. The Drug Enforcement Administration in the United States Department of Justice oversees all narcotics laws. Barbara M. Bayer

Narragansett Indians, *NAR uh GAN siht,* were a tribe that lived on the west side of Narragansett Bay, in what is now Rhode Island. The Narragansett spoke an Algonquian language. They made their living by hunting, fishing, and farming and by gathering edible plant foods. The tribe's name is also spelled Narraganset.

At first, the Narragansett were friendly to the English colonists who settled in the area. But relations gradually grew worse. In 1675, more than 4,000 Narragansett joined forces with Wampanoag Indian chief King Philip to drive out white settlers. But colonial troops killed all but about 100 warriors. In 1676, English settlers took over the Narragansett lands. Conrad E. Heidenreich

Narváez, *nahr VAH ayth,* **Pánfilo de,** *PAHM fee loh thay* (1470?-1528), was a Spanish soldier, explorer, and Indian fighter. He helped conquer Cuba in 1511 and lost an eye trying to arrest Hernando Cortés in Mexico in 1521. Holy Roman Emperor Charles V granted him the unexplored land of Florida in 1526, and he led an expedition there in 1528. Landing near Tampa Bay, he marched inland and lost many of his men in storms and Indian attacks. Having been cut off from their ships, Narváez and his men built five crude barges. They sailed along the coast to what is now south Texas. Narváez's boat was forced out into the Gulf of Mexico by winds and currents, and he was drowned. He was born in Valladolid. Helen Delpar

Narwhal, *NAHR hwuhl,* is an unusual whale of the Arctic. The male has a spiral ivory tusk about 8 feet (2.4 meters) long jutting out of its upper jaw, slightly to the left of center. This tusk is the narwhal's only tooth. A few narwhals have two tusks, with the right one underdeveloped. The female usually has no tusk. The tusks of most adult narwhals are worn at the tip and are often heavily scarred. Males sometimes fight each other with them.

Narwhals grow up to 17 feet (5.2 meters) long, not including the tusk, and weigh up to 2 tons (1.8 metric tons). They are grayish on top, whitish underneath, and have dark brown spots. Older narwhals are mostly white, with dark pigment spots on the head and neck. Arctic peoples hunt narwhals. They eat the skin and use the bone and ivory to make tools. Bernd Würsig

Scientific classification. The narwhal belongs to the whale order, Cetacea. It is *Monodon monoceros.*

Nasby, Petroleum Vesuvius (1833-1888), was the pen name of David Ross Locke, a popular American humorist. Locke strongly supported *temperance* (avoidance of alcoholic beverages), abolition of slavery, women's rights, and integrity in government. He presented Nasby as a scoundrel who displayed the prejudices and excesses Locke himself opposed. Locke wrote many satirical letters as Nasby and also impersonated the character in lectures. The Nasby letters feature the comic misspellings and ungrammatical sentences that were popular among humorists of the day.

Locke was born on Sept. 20, 1833, in Vestal, New York. His first Nasby letter was published in 1862. Nasby's writings were collected in *The Nasby Papers* (1864), *Swingin' Round the Cirkle* (1866), and *Nasby in Exile* (1882). His other works include poetry, plays, and novels.

David B. Kesterson

Nasdaq, *NAZ dak,* is the oldest electronic stock market in the world. The market's official name is The Nasdaq Stock Market®. Originally, its name was an acronym for the National Association of Securities Dealers Automated Quotations System (Nasdaq®). On the Nasdaq market, brokers called *market makers* buy and sell stocks through a vast computer network instead of on a trading floor. Participants around the world receive trading information over this computer network. Nasdaq lists nearly 5,000 stocks, including those of many high-technology companies, such as computer manufacturers and software developers.

The National Association of Securities Dealers, the world's largest self-regulatory organization for the securities industry, created the Nasdaq network in 1971. This

network automated the selling of *over-the-counter* (OTC) stocks, which are stocks not listed on any stock market or exchange. Nasdaq became a stock market in 1975 when it began listing stocks. In 1990, Nasdaq stopped dealing in OTC stocks and changed its name to The Nasdaq Stock Market.

Critically reviewed by The Nasdaq Stock Market, Inc.

Nash, Charles William (1864-1948), was a pioneer in the United States automobile industry. He became president of the Buick Motor Company in 1910, reorganized the company, and made it financially successful. Nash was elected president of General Motors Company (now General Motors Corporation) in 1912 when it was close to bankruptcy. The company prospered under Nash's leadership. Nash resigned from General Motors in 1916. He then bought the Thomas B. Jeffery Company, an automobile firm from which he formed Nash Motors Company. He was president of the company until 1932 and board chairman until he died. The Nash firm merged with Hudson Motors in 1954, and became American Motors. Nash was born on Jan. 28, 1864, in De Kalb County, Illinois. William L. Bailey

Nash, John Forbes, Jr. (1928-), is an American mathematician. He contributed greatly to the development of *game theory*—a method of studying strategic decision-making situations in which the choices of different participants influence one another. Nash proposed a solution for game situations in which no participant will benefit by changing strategy, thereby creating a balanced and stable point of the system. This concept, known as *Nash equilibrium,* has influenced many fields, including economics, political science, computer science, and biology. Nash also developed important concepts used in conflict resolution and negotiations.

Nash was born in Bluefield, West Virginia, on June 13, 1928. He received a Ph.D. degree from Princeton University in 1950. He taught at the Massachusetts Institute of Technology (MIT) from 1951 to 1959, when his career was interrupted by periods of mental illness. He later returned to Princeton. Nash shared the 1994 Nobel Prize in economic sciences with the Hungarian-born American economist John C. Harsanyi and the German economist Reinhard Selten. Roberto Serrano

See also **Game theory.**

Nash, Ogden (1902-1971), was a famous American writer of humorous and satirical poetry. He created a unique poetic style in his light-hearted verses.

Most of Nash's poems have lines of unequal length. He often stretched sentences over several lines to produce surprising and comical rhymes. In "The Terrible People," for example, Nash wrote:

> People who have what they want are very
> fond of telling people who haven't what
> they want that they really don't want it,
> And I wish I could afford to gather all
> such people into a gloomy castle on
> the Danube and hire half a dozen
> capable Draculas to haunt it.

Nash also used many puns and frequently made clever comparisons of apparently unrelated subjects. He sometimes invented words or misspelled real words to produce a carefully planned effect.

Although Nash wrote in a comic style, many of his poems make a serious point. He made satirical comments about American society and ridiculed what he considered foolish behavior, including his own. Nash described people as bewildered by all the complications of modern life. He regarded humor as the best means of surviving in a difficult world.

The first collection of Nash's verses, *Hard Lines,* was published in 1931. His other collections include *Many Long Years Ago* (1945) and *You Can't Get There From Here* (1957). *I Wouldn't Have Missed It* (1975) appeared after his death. Frederic Ogden Nash was born on Aug. 19, 1902, in Rye, New York. Many of Nash's poems were first published in *The New Yorker* magazine.

William Harmon

Nashe, Thomas (1567-1601), was an author who wrote some of the first works of prose fiction in English literature. He is remembered chiefly for *The Unfortunate Traveller; or, The Life of Jack Wilton* (1594), a forerunner of the English novel. This energetic narrative combines colorful fictional characters with references to actual people and events. *Pierce Penniless, His Supplication to the Devil* (1592) is a satire on Elizabethan society.

Nashe was born in Lowestoft, England. His name is also spelled Nash. He studied at Cambridge University and was one of the group of playwrights known as the "University Wits." Nashe's racy style and gift for rough language lent themselves to the pamphlet warfare that was widespread in Elizabethan literary life. In one famous series of pamphlets, Nashe attacked scholar Gabriel Harvey. Nashe also wrote several pamphlets in 1589 and 1590 that defended the bishops of the Church of England against attacks by the Puritans. This heated exchange of pamphlets became known as the Martin Marprelate controversy. John N. King

Nashua, *NASH oo uh* (pop. 86,605; met. area pop. 190,949), is the second largest city in New Hampshire. Only Manchester has more people. Nashua lies at the junction of the Merrimack and Nashua rivers (see **New Hampshire** [political map]). The city's products include computers, electronic equipment for the military, and fabricated metal products. The first permanent settlement was made there between 1665 and 1670. A town charter was granted in 1673 under the name of Dunstable. The town was renamed Nashua in 1837. The early settlers referred to the Indians who lived in the area as the *Nashaways.* Nashua was incorporated as a city in 1853. It is the home of Rivier and Daniel Webster colleges. A mayor and board of aldermen head the city's government. Claudette Durocher

Nashville (pop. 569,891; met. area pop. 1,231,311) is the capital and second largest city of Tennessee. Only Memphis has more people. Nashville lies in the north-central part of the state (see **Tennessee** [political map]). It is often called the *Athens of the South* because of its many educational institutions and its buildings in the Greek classical style. Nashville is also called *Music City, U.S.A.* because it is a major music recording center and the home of "The Grand Ole Opry" radio show.

Nashville was founded in 1779 by settlers from North Carolina looking for fertile farmland. The settlers built a log stockade on a bluff overlooking the west bank of the Cumberland River. They called the settlement Fort Nashborough after Brigadier General Francis Nash, who was a hero in the Revolutionary War in America (1775-1783).

State of Tennessee

Nashville is the capital of Tennessee and a music recording center. This photo shows the State Capitol, *right,* and the War Memorial Building, *left.*

The settlement was renamed Nashville in 1784.

The city. Nashville covers all of Davidson County, an area of 530 square miles (1,373 square kilometers). It is one of the nation's largest cities in area. The Nashville metropolitan area covers 4,135 square miles (10,710 square kilometers) and consists of eight counties.

The Cumberland River flows through downtown Nashville. The State Capitol overlooks Memorial Square. The 33-story BellSouth Building in downtown Nashville is the tallest structure in Tennessee.

Most of the people of Nashville were born in the United States. The city's largest ethnic groups include those of French, German, or Irish ancestry. African Americans form about a fourth of Nashville's population. About 5 percent of the city's people are Hispanics.

Economy. Large numbers of Nashville's people work for the state government. Many others have jobs with agencies of the federal or city government. Vanderbilt University combined with its medical center ranks as one of the city's largest employers.

Nashville is the headquarters for a number of major companies. The city also has more than 600 industrial plants. Its chief products include aircraft parts, food products, glass, heating and cooking equipment, printed materials, recordings of music, tires, and trucks. General Motors and Nissan automobile manufacturing plants are located near the city. Nashville's economy received a big boost during the 1950's, when the city became a major music recording center. More than 180 recording companies, 20 recording studios, and 400 song-publishing firms operate in the city.

Three interstate highways reach Nashville. Freight railroads and Nashville International Airport serve the city. Barge lines connect the city with ports on the Cumberland River. *The Tennessean* is the daily newspaper.

Education. The metropolitan Nashville public school system consists of about 125 schools and about 65,000 students. The city has about 40 private and parochial schools. Vanderbilt University is the largest of the city's institutions of higher education. Other colleges and universities in the city include Belmont University, Fisk University, Lipscomb University, Meharry Medical College, Scarritt College for Christian Workers, Tennessee State University, and Trevecca Nazarene University.

Cultural life and recreation. The city's arts groups include the Nashville Symphony Orchestra, the Nashville Ballet, and theater groups. The Tennessee State Museum is in Nashville. An exact replica of the Parthenon of Athens stands in Centennial Park. The Tennessee Centennial of 1897 was held in the park.

Other attractions include the Country Music Hall of Fame and Museum, Frist Center for the Visual Arts, Cumberland Science Museum, Nashville Zoo at Grassmere, and Cheekwood Botanical Garden and Museum of Art. The Grand Ole Opry House and downtown's historic Ryman Auditorium host "The Grand Ole Opry" and its weekly radio program. The program, which began in Nashville in 1925, features country music.

The Hermitage, the home of President Andrew Jackson, lies about 10 miles (16 kilometers) east of Nashville. Jackson and his wife are buried on the grounds of the mansion.

Nashville is the home of the Nashville Predators of the National Hockey League and the Tennessee Titans of the National Football League. The nearby Nashville Superspeedway hosts Indy and stock car races.

Government. Nashville has a mayor-council form of government. The voters elect the mayor and the 40 council members to four-year terms.

History. The first white people who came to what is now the Nashville area found Shawnee Indians living along the Cumberland River. More settlers arrived after the establishment of Fort Nashborough in 1779. By 1780, the settlement consisted of seven forts with a total population of 300. Tennessee became a state in 1796, and Nashville was chartered as a city in 1806.

The first steamboat arrived in Nashville about 1818, and a brisk trade developed between Nashville and ports along the Ohio and Mississippi rivers. Various cities, including Kingston, Knoxville, and Murfreesboro, served as the capital of Tennessee. Nashville became the permanent capital in 1843. By 1850, the city's population had reached 10,165.

During the American Civil War, Union troops held Nashville from 1862 until the fighting ended in 1865. Confederate General John B. Hood tried to recapture the city in 1864 but was defeated by Union General George H. Thomas. In 1900, Nashville had a population of 80,865. The busy river trade, plus income from the fertile farmlands surrounding the city, contributed to Nashville's prosperity. From 1920 to 1930, the city's population increased from 118,342 to 153,866.

In 1962, Nashville and Davidson County adopted a metropolitan form of government. This government combines city and county functions under one administration and provides services for the entire county.

An urban renewal project for downtown Nashville, completed in 1980, included the widening and landscaping of city streets and the construction of office buildings. Also in the late 1900's, the Nashville Convention Center and Riverfront Park were completed.

Patrick S. "Pat" Embry

For the monthly weather in Nashville, see **Tennessee** (Climate). See also **Tennessee** (pictures).

Naskapi Indians, *NAS kuh pee,* are a Far North tribe that lives in Schefferville, Quebec, and in Davis Inlet, a

village near Hopedale, on the northeast coast of Labrador, Canada. Nearly 400 Naskapi live in Schefferville and hold a variety of jobs. Most of the approximately 200 members of the tribe who live in Davis Inlet catch fish and hunt seals off the coast. The Naskapi speak an Algonquian dialect related to Macro-Algonquian, which is one of the 10 Indian language groups.

Before the 1900's, the Naskapi lived most of the year in the rugged forests and plains of the Labrador interior. They had moved there in the late 1700's and the early 1800's to hunt caribou, which lived on the plains. These animals supplied the Naskapi with food and clothing. The caribou also provided hide for tents and bone for needles and knives. In the fall, several Naskapi bands united to hunt caribou. In winter, the Naskapi lived on meat that they had stored, and hunted caribou on the animals' winter feeding grounds. In spring and summer, fish and small game provided food for the tribe.

The Naskapi of Davis Inlet moved to the coast in the early 1900's because of a severe decline in the number of caribou. However, the tribe still has an annual caribou hunt in fall and winter. James A. Tuck

See also **Indian, American** (illustration: Indian ways of life).

Nasmyth, *NAY smihth,* **James** (1808-1890), a Scottish engineer, invented the steam hammer in 1839. His steam hammer was able to forge large parts for steamships and railroads. He also developed the *self-acting principle* in machine-tool design, by which a mechanically held tool moves along a track and works on a stationary workpiece. Using this principle, Nasmyth invented a planing mill and a nut-shaping machine.

Nasmyth was born on Aug. 19, 1808, in Edinburgh. In 1829, he became assistant to a tool designer and manufacturer. In 1834, he started the Bridgewater Foundry at Manchester, which gained fame for machine-tool and steam-engine construction. He retired in 1856 and devoted his time to studying astronomy. David F. Channell

Nassau, *NAS aw* (pop. 135,437), is the capital and largest city of the Bahamas. The city borders an excellent harbor on the northeast coast of New Providence Island. For the location of Nassau, see **Bahamas** (map). Its warm, sunny climate has made it a major tourist center.

Near Nassau's harbor are beautiful beaches and luxurious hotels. Nassau also features fine restaurants, colorful markets, and casinos. Most major banks, stores, and government buildings are on Bay Street, which runs along the harbor. Nassau has several historic buildings, including three forts built in the 1700's. The nation's only college, the College of the Bahamas, is in Nassau.

Many of Nassau's people work in the tourist industry and are prosperous. But the city has few manufacturing industries, and unemployment is high. Some Nassau residents live in charming, pastel-colored houses. In the city's older, poorer neighborhoods, people live in rundown houses, some of which have no running water.

Nassau's busy harbor serves as a port for cruise ships that carry tourists to the city. Smaller ships called *mailboats* move freight and passengers between Nassau and the many islands that make up the Bahamas. Such products as fish, oil, and rum are shipped through Nassau.

English seafarers founded a settlement named Charles Towne at what is now Nassau in the 1660's. The settlement was renamed Nassau in 1695. During the late 1600's, many pirates used Nassau as a base to attack Spanish ships sailing from Cuba or Mexico. The Bahamas became a British colony in 1717, with Nassau as the capital. Nassau became prosperous during the American Civil War (1861-1865), when ships carried goods from the city to the Confederate States. It also prospered during the U.S. Prohibition Era (1920-1933) as a distribution center for the illegal shipment of alcoholic beverages into the United States. Tourism has been Nassau's principal industry since 1929. In that year, commercial airline flights began operating between the United States and Nassau. In 1973, the Bahamas gained independence from the United Kingdom. Stephen C. Dodge

Nasser, *NAH sehr,* **Gamal Abdel,** *gah MAHL AHB duhl* (1918-1970), led the revolt that overthrew King Faruk in 1952 and established Egypt as a republic. Nasser served as prime minister from 1954 until he was elected president of Egypt in 1956. Later that year, a world crisis occurred after Egypt seized the Suez Canal, then under international control. Nasser wanted to use the tolls collected from users of the canal to build the Aswan High Dam. When Syria and Egypt formed the United Arab Republic (U.A.R.) in 1958, Nasser became its president. Syria withdrew from the U.A.R. in 1961.

Nasser resigned after Egypt lost the Arab-Israeli War of 1967. But the Egyptian National Assembly refused to accept his resignation. Massive demonstrations of public support led him to stay in office. He became both president and prime minister. Fighting between Israel and Arabs continued into the 1970's. Nasser relied heavily on Soviet military aid. In August 1970, he agreed to a 90-day cease-fire with Israel. He died on Sept. 28, 1970.

Nasser's book, *Egypt's Liberation: The Philosophy of the Revolution* (1955), stated his aim to unite all Arabs under Egyptian leadership. Although his efforts toward this goal failed, he became one of the most influential leaders in the Arab world. Nasser favored a neutral foreign policy. His guiding principles were nationalism and economic reform. Nasser redistributed land to farmers and also advanced education. His efforts to develop Egypt's economy were hampered by overpopulation.

Born on Jan. 15, 1918, in Alexandria, Egypt, Nasser graduated from the Royal Military Academy in Cairo. He fought in the Arab war against Israel in 1948 and 1949.

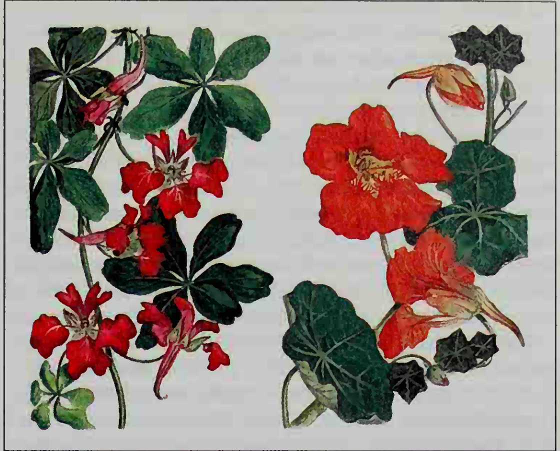
Nast, Thomas (1840-1902), was an American political cartoonist. He popularized the famous political symbol of the Democratic donkey and originated the Republican elephant and the Tammany Tiger (see pictures with **Democratic Party; Republican Party**). His caricatures of the Tammany Tiger helped break up the notorious political organization headed by William "Boss" Tweed in New York City (see **Tweed, William Marcy**).

Nast's cartoons began to run in the popular magazine *Harper's Weekly* in the 1860's. He did his best work during the American Civil War, when his political cartoons

Chicago Historical Society

Nast drew the Tammany Tiger to symbolize the corrupt Tammany political machine in New York City. This cartoon appeared after the machine defeated its Republican opponents in 1871.

influenced public opinion in favor of the North. In the presidential campaign of 1872, Nast's barbed cartoons helped bring about the defeat of Horace Greeley (see **Greeley, Horace**). Nast is also credited with creating the present-day image of Santa Claus in sketches that appeared in *Harper's Weekly* in the 1860's.



Nast was only an average draftsman. But he excelled at inventing concepts for cartoons and at arranging the elements of his designs. In most cases, Nast drew sketches that were given to other artists, who used the sketches to make engravings in blocks of wood. The engravings were used to print the cartoons.

Nast was born in Landau, Bavaria, and came with his mother to the United States in 1846. He worked as a draftsman on *Frank Leslie's Illustrated Newspaper* and sketched warfare in Italy for New York City, London, and Paris newspapers. Charles P. Green

For other pictures by Thomas Nast, see **Carpetbaggers; New York City;** and **Santa Claus.**

Nasturtium, *nuh STUR shuhm,* is the common name of a group of perennial plants native to tropical America. Nasturtium is a favorite garden flower of North America. There, it is a trailing or climbing annual that may reach about 10 feet (3 meters). Its blossoms are yellow, orange, or red. Dwarf nasturtiums are also grown.

The nasturtium flower has an interesting structure. There are five small *sepals* (outer "petals"). The three upper ones form a long spur that holds the nectar. There are also five petals. The three lower petals are a little apart from the upper two and have long, fringed claws. The long-stalked leaves are shaped like an umbrella. They have a spicy taste and are used in salads. The leaves also make an attractive light green background for the bright flowers.

WORLD BOOK illustration by Lorraine Epstein

The nasturtium is a North American garden plant. It has umbrella-shaped leaves and orange, red, or yellow blossoms.

Nasturtiums grow well from seeds sown outdoors in spring. They can also be potted in the early spring and transplanted in May. The plants cannot stand frost, but may be grown indoors in winter. Nasturtiums are easy to grow. They thrive best in bright sunlight. Small insects, called black aphids, often attack the plants and live on the underside of the leaves. The insects will destroy the nasturtium unless they are controlled with an insecticide. The name *nasturtium* is also given to the genus of the water cress (see **Cress**).

Scientific classification. Nasturtiums belong to the nasturtium family, Tropaeolaceae. The scientific name for the garden flower is *Tropaeolum majus.* Daniel F. Austin

Natal, *nuh TAL,* is a historic region on the east coast of South Africa. The region has been the home of Zulu people for centuries. The region's full name is *Terra do Natal,* which means *Land of Christ's Birth* in Portuguese. The name was chosen by the Portuguese explorer Vasco da Gama when he sighted the region on Christmas Day, 1497.

Between 1818 and 1828, a Zulu leader named Shaka established a powerful state known as KwaZulu (Zululand) in northern Natal. The southern part of Natal became a British colony in 1843. White settlers opened sugar plantations and encouraged workers to come from India to Natal. In 1879, after two bloody wars between the Zulu and the Natal colonial authorities, Zululand was made part of the British colony of Natal.

The British gave the government of Natal to the white minority in the region even though more Zulu and Indians lived there. In 1910, Natal became one of the four provinces in the new Union of South Africa. The three other provinces were Cape Province, Orange Free State, and Transvaal. In 1994, black people took over the South African government. That same year, South Africa increased the number of its provinces to nine. The Natal area remained a province, but the province's name was changed to KwaZulu-Natal. The province of KwaZulu-Natal covers about 35,000 square miles (91,000 square kilometers). Pietermaritzburg is its capital. The port city of Durban is its largest city. Bruce Fetter

See also **Bantu; Durban; Pietermaritzburg; Zulu.**

Natchez, *NACH ihz,* Mississippi (pop. 18,464), is the oldest city on the Mississippi River. It lies on the state's southwestern border (see **Mississippi** [political map]).

Jean Baptiste Le Moyne, Sieur de Bienville, a French governor of Louisiana, built Fort Rosalie on the site in 1716. The white settlement around the fort took the name Natchez from a local Indian tribe. In 1729, the Natchez Indians destroyed the fort, but settlement of the area continued. The United Kingdom gained control of the territory in 1763. Spain controlled it from 1779 until it became part of the United States in 1798. The growth of the cotton industry made Natchez Mississippi's center of wealth and culture before the Civil War (1861-1865).

Natchez attracts many tourists because it has the largest concentration of *antebellum* (pre-Civil War) houses in the nation. The city is also a retail and manufacturing center. Products include lumber, oil, pecans, and rayon pulp. Natchez has a mayor-council government. It is the seat of Adams County. Joan W. Gandy

Natchez Indians, *NACH ihz,* were a tribe in North America whose important chiefs had total power over their subjects' lives and property. The tribe once lived near the city along the Mississippi River that was named after them. They were farmers, and they made excellent fabrics and pottery. Each tribe member inherited a place in a society of rigid class distinctions. There were three classes of nobility, as well as a large group of common people. The Natchez had a highly developed religious life based on sun worship. They believed that their chief was descended from the sun. Servants carried him about in a special litter, so that his feet would not touch the ground. When an important Natchez chief died, tribe members paid considerable respect to the leader and performed sacrifices.

The name of the Natchez first occurs in the reports of Sieur de La Salle's descent of the Mississippi River in 1682. The tribe, which probably included about 6,000 people, was the largest and strongest on the lower Mississippi at that time. They fought three major wars with the French, but were so soundly defeated in 1729 that the tribe did not recover. The survivors joined other tribes. Donald L. Fixico

Natchez Trace was an important commercial and military route between Nashville, Tennessee, and Natchez, Mississippi, in the early 1800's. Pioneers who floated their goods on flatboats down the Mississippi River to New Orleans often returned on horseback along this route. Settlers moving into Alabama, Florida, Louisiana, Mississippi, or Texas frequently traveled south on the trace. In 1800, Congress made it a *post road* (mail route). In 1938, the Natchez Trace National Parkway was established. William E. Foley

See also **National Park System** (table: Parkways).

Nation is a large group of people united by a common language, ancestry, history, or culture. People often feel great loyalty to their nation and pride in their national characteristics. Such feelings of loyalty and pride are often referred to as *nationalism.* See **Nationalism.**

In international law, *nation* means a group of people exercising self-government within a defined territory with the *recognition* of other nations. Recognition is shown by other nations through the exchange of ambassadors. When a new nation is recognized by other nations, it acquires certain rights and duties. Its rights include the right to navigate freely on the high seas. Its duties include the obligation not to threaten or use military force against other nations. Sometimes in international law, a nation is called a *country* or *state.* For more information on nations as defined in international law, see **Country; International law.** Anthony D'Amato

Nation, Carry Amelia Moore (1846-1911), became well known for her violent efforts to stop the sale of alcoholic liquors. Although she was arrested often for disturbing the peace, she impressed many people with her sincerity and courage. Other people considered her intolerant. She carried the temperance crusade from the level of education to that of action, and helped bring on national prohibition, which was adopted in 1919, after her death (see **Prohibition**).

She was born on Nov. 25, 1846, in Garrard County, Kentucky. In 1867, she was married to Dr. Charles Gloyd, a drunkard who died soon after their marriage. She then taught school and rented rooms. In 1877, she married David Nation, a lawyer and minister. Her strong religious interests intensified, and she began to see visions. Her belief that she was divinely protected increased in 1889, when a fire in her town left her hotel untouched. She thought, too, that her name (Carry A. Nation) had been preordained.

The Nations settled in Kansas in 1889. An 1880 state law banned liquor sales there. But it was not enforced. Carry Nation began in 1890 to pray outside saloons. Later she began to smash them. Nearly 6 feet (183 centimeters) tall and strong, she did much damage, first with stones and other implements, and later with hatchets. She closed the saloons of her own town, Medicine Lodge, and destroyed saloons in the chief Kansas cities. When she entered states where liquor sales were legal, she was often arrested for disturbing the peace.

Carry Nation opposed tobacco, and immodesty in women's dress. She spoke eloquently, and inspired others to imitate her. Her husband divorced her for desertion in 1901. Louis Filler

Nation of Islam is a religious group in the United States that preaches black nationalism. American minister Louis Farrakhan established the organization in 1977. He based it on the teachings of Elijah Muhammad, who had led a group of the same name from 1934 to 1975. Farrakhan continued Muhammad's teachings about the need for self-knowledge, the acceptance of black identity, and economic independence.

Farrakhan's Nation of Islam is headquartered in Chicago. Its members are urged to eat only one meal a day and to avoid the use of tobacco and alcohol. Women are expected to emphasize housework and child rearing, though some women serve as ministers. The key groups in the organization are the Fruit of Islam and Muslim Girls Training (MGT). Members of the Fruit of Islam provide security in *mosques* (places of worship) and public places. Members of the MGT learn domestic skills.

The original Nation of Islam (also called Black Muslims) was founded in Detroit in 1930 by a salesman named Wallace D. Fard (also known as Wali Farad). Elijah Muhammad (formerly Elijah Poole) led the group from 1934 until his death in 1975. He taught that Fard was Allah and he himself was Allah's messenger. Muhammad also taught that white people were "devils" who sought to harm and oppress blacks. He said that whites would eventually be destroyed and blacks would emerge victorious.

Muhammad's son Warith Deen Mohammed (sometimes spelled Muhammad) succeeded him. Instead of continuing his father's teachings, Warith dismantled the Nation of Islam. He led his followers to Sunni Islam, a traditional branch of Islam practiced by many Africans. In time, his group became known as the Muslim American Society. Farrakhan and other discontented followers resurrected the Nation of Islam but rejected the name Black Muslims. Farrakhan also stopped preaching that whites would eventually be destroyed.

In 1997, Farrakhan began to move closer to traditional Sunni Islam. He adopted the orthodox Friday worship service, prayer posture, and fasting. These measures helped end 25 years of separation and hostilities between Farrakhan and Mohammed. The two men declared their unity at the second International Islamic Conference in Chicago in February 2000. But they continue to lead separate movements. Lawrence H. Mamiya

National Academy of Sciences (NAS) promotes research in the behavioral, biological, physical, and social sciences. It also uses these sciences for the general welfare. The NAS serves as a scientific adviser to the United States government but is not a government agency. The NAS consists of about 1,600 scientists elected to the organization in recognition of their achievements in research. Foreign scientists may be elected as foreign associates. A maximum of 60 Americans and 15 foreign associates may be elected annually.

The NAS has created three organizations—the National Research Council, the National Academy of Engineering, and the Institute of Medicine. The National Research Council carries out most of the work of the other organizations. The National Academy of Engineering and the Institute of Medicine elect their own members but cooperate closely with the NAS in advising the government on matters of technology and health.

The National Research Council enables other scientists to work with members of the National Academy of Engineering, the Institute of Medicine, and the NAS. About 10,000 scientists and engineers belong to committees and other groups organized by the council to solve scientific and technological problems. The council is financed by government and private funds.

The National Academy of Engineering consists of engineers who are elected because of professional achievement. The academy has about 700 members.

The Institute of Medicine has over 300 members. They are chosen because of their interest in problems of health and medicine. At least a fourth of the members come from fields other than health and medicine.

Congress established the NAS in 1863. Its charter requires the NAS to provide free advice to the government on scientific matters in addition to engaging in other scientific activities. The NAS established the National Research Council in 1916. The National Academy of Engineering was established in 1964. The Institute of Medicine was founded in 1970. All four groups have headquarters in Washington, D.C.

See also National Research Council.

National Aeronautic Association, also called NAA, promotes the advancement of aviation and space flight in the United States. It is the U.S. representative to the Fédération Aéronautique Internationale (FAI). As such, the NAA is the only U.S. organization that can approve and certify flight records by U.S. civilian and military aircraft. The NAA also sponsors U.S. teams in sport aviation championships.

The NAA annually presents four awards for achievements in flight. They are the Wright Brothers Trophy, the Collier Trophy, the Brewer Trophy, and the Mackay Trophy. The NAA was chartered in 1922. The organization's full name is National Aeronautic Association of the U.S.A. Its headquarters are in Arlington, Virginia.

Critically reviewed by the National Aeronautic Association of the U.S.A.

National Aeronautics and Space Administration (NASA) is a United States government agency that conducts and coordinates research on flight within and beyond the earth's atmosphere. NASA employs thousands of scientists, engineers, and technicians in 10 major installations. These facilities include the John F. Kennedy Space Center on Merritt Island, Florida, and the Lyndon B. Johnson Space Center in Houston.

NASA was established in 1958, with headquarters in Washington, D.C. It absorbed the National Advisory Committee for Aeronautics. NASA has launched many space flights both with and without astronauts. The flights that carried no crew included artificial satellites and space probes used for scientific research and practical applications, such as communications and weather forecasting. In 1969, NASA's Apollo 11 spacecraft became the first to land human beings on the moon. In 1981, NASA launched Columbia, the first space shuttle.

In 1986, NASA suffered the worst accident in its history. The shuttle Challenger broke apart shortly after launch on January 28. All seven crew members were

killed. NASA resumed space flight in September 1988 with the launch of the redesigned shuttle Discovery.

NASA's Mars exploration program also had setbacks. Two remotely controlled probes to Mars, the Mars Climate Orbiter and the Mars Polar Lander, were lost in 1999. Two independent panels that investigated the losses blamed each of them on mix-ups and mismanagement. The failures led NASA to postpone the launch of another Mars lander, which had been planned for 2001. NASA also began a detailed review of its Mars exploration plan.

In 1993, the United States and Russia agreed to work toward the construction of what would be called the International Space Station (ISS). In 1995, in the first phase of the ISS project, the shuttle Atlantis docked with the Russian space station Mir. By the late 1990's, agencies representing 14 other nations had joined NASA and its Russian partners on the project. NASA was to manage the ISS. Completion is scheduled for the early 2000's.

In 2000, NASA put a probe called the Near Earth Asteroid Rendezvous (NEAR) into orbit around an asteroid named Eros. NEAR was the first spacecraft to orbit an asteroid. Johns Hopkins University in Maryland built the probe and helped manage the mission. Alex Roland

National Air and Space Museum, in Washington, D.C., features exhibits on aviation and space flight. It is part of the Smithsonian Institution. The museum has more than 20 galleries, a theater, and a planetarium. The displays include the Wright brothers' 1903 *Flyer;* Charles A. Lindbergh's *Spirit of St. Louis;* X-1 and X-15 aircraft; and Mercury, Gemini, and Apollo spacecraft. Museum visitors may walk through a Skylab space station. Congress created the National Air Museum in 1946 and gave it its present name in 1966. The museum's present building, on the National Mall, opened in 1976.

National Alliance of Business (NAB) is a nonprofit organization committed to building a quality work force for the United States. The NAB helps private businesses, state and local governments, education organizations, and labor groups form partnerships to improve education, training, and employment programs.

The NAB helps state and local partnerships (1) develop learning programs in the workplace, (2) involve business in the restructuring and reform of public education, and (3) create job-training for unskilled and unemployed individuals. It provides guidance and information on these efforts through publications, conferences, seminars, and an information center.

President Lyndon B. Johnson established the NAB in 1968. The organization has regional offices in Atlanta, Georgia; Chicago; Dallas; Los Angeles; and New Brunswick, New Jersey. Its headquarters are in Washington, D.C. Critically reviewed by the National Alliance of Business

National anthem is the official patriotic song of a nation. National anthems are intended to stir a sense of patriotism and loyalty among citizens of a country. They are performed at official and ceremonial public occasions, international gatherings, and athletic events. They are also played to honor a head of state.

Most national anthems are composed as marches, hymns, and anthems. The words of some commemorate the ideals of the nation. Others celebrate a country's natural beauty or honor a national hero. Some recall a national crisis or important event in a country's history.

Many countries have adapted existing music and words for their anthems. For example, John Stafford Smith, an English composer, wrote "To Anacreon in Heaven" (late 1700's?). The song became the music for "The Star-Spangled Banner," the national anthem of the United States. The words of the anthem are a poem written by Francis Scott Key in 1814.

The idea of an official national anthem dates from about 1825. At that time, Britain's patriotic song "God Save the King" (or "Queen") was called "the national anthem." However, the song had been performed as early as 1745 and ranks as the oldest national anthem in the world. Leonard W. Van Camp

National Archives, *AHR kyvz,* is an independent federal agency that preserves and makes available for public use the permanently valuable records of the United States government. Its official name is the National Archives and Records Administration. The archives, established in 1934, include most of the nation's presidential libraries (see **Presidential libraries**).

The National Archives takes care of millions of records, including maps, sound recordings, still pictures, and motion pictures. These records date from 1774 to the present. Many of the records are kept in the National Archives Building in Washington, D.C. The temperature and humidity of the building's 196 stack areas are carefully controlled. Each year, more than a million people visit the stately Exhibition Hall to see such historic documents as the Declaration of Independence

National Archives

Exhibition Hall in the National Archives Building houses such historic documents as the Declaration of Independence and the Constitution of the United States.

and the U.S. Constitution. These charters of America's freedom are sealed in bronze and glass cases filled with helium. They can be lowered at a moment's notice into a fire-resistant and shockproof safe.

National Assessment of Educational Progress is a government program designed to evaluate the quality and progress of education in the United States. It is sometimes referred to as NAEP or "the Nation's Report Card." The program was created by Congress in 1964 and is directed and funded by the U.S. Department of Education's National Center for Education Statistics. NAEP conducted its first evaluation in 1969. Since then, it has issued more than 300 reports.The program's staff surveys students at three age and grade levels: 9-year-olds and 4th-graders, 13-year-olds and 8th-graders, and 17-year-olds and 12th-graders. The assessment presents profiles based on nationally representative samples of these students. The tests cover such areas as art, computer skills, literature, mathematics, music, science, U.S. history, and writing. In 1988, Congress specified that reading and mathematics be assessed every two years, writing and science every four years, and history and geography at least every six years. Educational Testing Service, a private, nonprofit corporation, has administered NAEP since 1983.

Critically reviewed by Educational Testing Service

National Association for the Advancement of Colored People (NAACP) is a civil rights organization in the United States. It works to end discrimination against blacks and other minority groups.

The NAACP achieves many goals through legal action. It played an important part in the 1954 ruling of the Supreme Court of the United States that segregation of blacks in public schools is unconstitutional. Thurgood Marshall, a lawyer from the NAACP Legal Defense and Educational Fund, presented the argument in the case, known as *Brown v. Board of Education of Topeka.*

The organization also achieves its goals through legislative action. It played a leading role in obtaining passage of the Civil Rights Act of 1957, which protects the right to vote. This act established the Civil Rights Division of the Department of Justice and the Commission on Civil Rights. The NAACP worked for passage of the Civil Rights Act of 1964, which forbids discrimination in public places. This law established the Equal Employment Opportunity Commission (EEOC). The association also helped bring into law the Voting Rights Act of 1965, which protects voter registration.

Activities. The NAACP has worked successfully to fight discrimination in housing and to strengthen the penalties for violations of civil rights. In the 1970's and 1980's, it helped win extensions of the Voting Rights Act of 1965. The NAACP also led successful efforts in 1972 to increase the power of the EEOC. In 1986, the NAACP successfully campaigned for the United States to impose economic sanctions against South Africa because of its system of racial segregation, called *apartheid.* The NAACP helped obtain passage of an amendment in 1988 that strengthened the Fair Housing Act of 1968.

The organization strives to protect the rights of prison inmates. Its investigation of problems facing black military personnel led to changes in the system of military assignments and promotions. The NAACP sponsors a program of voter education and registration. It works for desegregation of public schools and fights dismissals and demotions of black teachers and administrators that it considers discriminatory. It urges publishers to produce textbooks that provide an accurate account of the achievements and activities of blacks. The NAACP also seeks to reduce the number of students who drop out of school and to encourage and reward academic, scientific, and artistic excellence among black students.

The NAACP also acts to reduce poverty and hunger. In 1968, the organization established the Mississippi Emergency Relief Fund to feed poor blacks in the Mississippi Delta area.

History. The NAACP was founded in 1909 by 60 black and white citizens. In 1910, the organization began to publish *Crisis,* a magazine about blacks who have achieved success in the arts, business, and other fields.

During the NAACP's first 30 years, it worked to prevent violence against blacks, unjust legal penalties, and job discrimination. Much of its activity centered on passage and enforcement of antilynching laws. During World War II (1939-1945), the NAACP tried to obtain equal rights for black military personnel and more job opportunities for black civilians. After the war, the association stepped up its long struggle against the policy that treated blacks as "separate but equal." This policy had been established in 1896 by the Supreme Court's ruling in the case of *Plessy v. Ferguson.*

The NAACP has hundreds of thousands of members and hundreds of youth councils. It receives funds from membership fees and from private donations. It has headquarters in Baltimore. It has a legislative bureau in Washington, D.C. The NAACP Legal Defense and Educational Fund, which has been an independent organization since 1957, is headquartered in New York City.

National Association of Congregational Christian Churches is a Protestant religious fellowship. It was founded in 1955 by a number of Congregational Christian Churches. It stresses cooperation among member churches but has no authority over them.

The association operates missions, supports students in seminaries, and conducts training programs for ministers. It also sponsors several commissions dealing with various church affairs and publishes a journal called *The Congregationalist.* The association has about 400 churches and about 95,000 members. The national office is in Oak Creek, Wisconsin. Critically reviewed by the National Association of Congregational Christian Churches

National Association of Manufacturers (NAM) is an organization of American manufacturing compa-

nies. It is the largest broad-based manufacturing *advocacy* (support) group in the United States. It serves as a policymaking body for the manufacturing industry on industrial and economic matters, and other public issues. It also interprets industry's policies to the federal government and the public. The organization's 12,500 member companies produce about 85 percent of U.S. manufactured products.

Representatives from NAM's member companies form policymaking committees that make recommendations to its Board of Directors. The board and an Executive Committee meet several times a year to determine policies. NAM was founded in 1895. It has headquarters in Washington, D.C.

National budget is the financial plan for a nation's government. The budget forecasts the government's income and expenditures for one *fiscal year* (from October 1 to September 30 in the United States). It forecasts how much money the government will collect from taxes and other sources, and suggests how much money each government department should spend.

In the United States, the Office of Management and Budget prepares the federal budget, and the congressional budget committee reviews and amends it. The government gets most of its income from individual and corporation income taxes and payroll taxes for social insurance. Most government expenditures are for social insurance benefits, national defense, and interest on the national debt (see **National debt**). Thomas F. Dernburg

National Bureau of Economic Research is a private nonprofit corporation that conducts research on economic issues. It provides universities, professional associations, corporations, and the United States government with information and objective analyses of economic problems. The bureau is not affiliated with any university or government agency, or with any other organization.

The bureau is perhaps best known for its studies of *business cycles,* the rises and falls in economic activity. For example, it determines when U.S. *recessions* (periods of reduced economic activity) begin and end. The bureau also researches such matters as international trade, taxation, investment, and labor markets. Other projects deal with private pensions and social security, and with the historical development of the economy.

Researchers at the bureau have developed important statistical methods now used to measure economic performance. For example, they devised ways to estimate national income and studied the rate of *capital formation* (growth in the stock of machinery, buildings, and other productive goods). Business people, economists, and government officials use these figures to determine economic conditions and to plan for the future.

The National Bureau of Economic Research was founded in 1920. It is governed by a board of directors, which includes industrial leaders, bankers, financial experts, university economists, and accountants. The bureau's offices are located in Cambridge, Massachusetts, New York City, and Palo Alto, California.

National Catholic Educational Association is a group that encourages cooperation and mutual helpfulness among Roman Catholic educators, and promotes, by study, conference, and discussion, Catholic educational work in the United States. The group was founded as the Catholic Educational Association in 1904 in St. Louis, Missouri, and, in 1927, became the National Catholic Educational Association. Its work is carried on by a Parents Organizations Commission and various departments. These departments are the Boards of Education, Chief Administrators of Catholic Education, College and University, Elementary School, Religious Education, Secondary School, Seminaries, and Special Education. The organization has about 14,500 members. Its headquarters are located in Washington, D.C.

National cemetery is a burial place for men and women who served in the armed forces of the United States. Veterans are eligible to be buried in a national cemetery unless they received a dishonorable discharge. In addition, the spouses and dependent children of these veterans may be buried in national cemeteries. The government maintains about 130 national cemeteries throughout the United States and Puerto Rico. More than 50 of them have no space for additional graves. Almost 2 million people are buried in national cemeteries.

Four government agencies operate the national cemeteries. The Department of Veterans Affairs maintains 114 of the cemeteries. The National Park Service is responsible for 14 national cemeteries that are part of historic sites. The Department of the Army operates 2

cemeteries—Arlington National Cemetery in Arlington, Virginia, and Soldiers Home National Cemetery in Washington, D.C. The American Battle Monuments Commission maintains all U.S. military cemeteries outside the United States and its possessions.

The Department of Veterans Affairs provides headstones and markers for all graves in national cemeteries and for all graves of veterans that do not have them. These graves include those of Civil War soldiers.

The national cemetery system was established in 1862, during the American Civil War. That year, Congress granted President Abraham Lincoln permission to establish cemeteries for Union Army veterans.

One of the best-known national cemeteries operated by the National Park Service is in Gettysburg, Pennsylvania. A crucial Civil War battle was fought in Gettysburg in July 1863. On November 19 that year, Lincoln delivered his Gettysburg Address at a ceremony dedicating part of the battlefield as a cemetery. The other historic cemeteries operated by the National Park Service are Andersonville in Georgia; Andrew Johnson, Fort Donelson, Pittsburg Landing, and Stones River in Tennessee; Antietam in Maryland; Battleground in Washington, D.C.; Chalmette in Louisiana; Custer at Little Bighorn Battlefield National Monument in Montana; Fredericksburg, Poplar Grove, and Yorktown in Virginia; and Vicksburg in Mississippi. National Collegiate Athletic Association (NCAA) is an organization that establishes athletic standards and official playing rules for college sports. It conducts 81 national collegiate championships in 19 sports for men and 17 sports for women and keeps the official national statistics and records of selected college sports.

In addition, the association conducts studies on issues in athletics, and it maintains a large film and video library covering play in championship events. The association also sponsors a post-graduate scholarship program and a degree-completion program for student-athletes who have exhausted their intercollegiate athletics eligibility.

The NCAA was founded in 1906. The association's membership has grown from 13 schools to over 1,000, including colleges and universities, athletic conferences, and coaches' associations. The headquarters of the NCAA are in Indianapolis.

National Conference of Christians and Jews is a nonprofit human relations organization engaged in a nationwide program to eliminate prejudice and discrimination and to promote religious, social, and ethical participation in American society. The conference works to foster understanding among all ethnic, racial, and religious groups. The organization's educational program includes creative dialogues, institutes, seminars, workshops, and camps.

The National Conference of Christians and Jews works with teachers, parents, young people, police, clergy, business, labor, and community leaders. It sponsors Brotherhood/Sisterhood Week (see **Brotherhood/Sisterhood Week**). The conference was founded in 1927. Its headquarters are in New York City.

National Congress of American Indians is the oldest, largest, and most representative national American Indian organization in the United States. It represents about 250 tribes and has more than 750,000 individual members.

The NCAI is organized as a representative congress to reach agreement on important national issues. It evaluates and monitors government policies on Indian affairs and promotes government initiatives and programs to improve the economic well-being, educational opportunities, and health of American Indians and Alaskan natives. The NCAI works to persuade members of the U.S. Congress to support legislation that benefits Native Americans.

The NCAI is governed by a president and an executive council, which consists of members democratically elected from 12 geographic areas of the United States. The organization operates under the leadership of an executive director. The NCAI publishes the *Sentinel,* a bimonthly newsletter.

The NCAI was founded in 1944. Its national office is in Washington, D.C. Leon F. Cook

National Congress of Parents and Teachers is a volunteer organization that unites the forces of home, school, and community to promote the education, health, and safety of children. The National Congress is commonly called the National PTA. Local units of the organization, known as Parent-Teacher Associations (PTA's), operate in individual schools from the elementary to the high school level and in other community locations. In many high schools, the local groups are called Parent-Teacher-Student Associations (PTSA's) because students also take part in their activities. PTA's and PTSA's urge their members to become fully informed about education and to take an active interest in school programs. The units conduct regularly scheduled meetings and organize workshops and community service programs to benefit children, teen-agers, and families.

PTA's and PTSA's design their programs to fit both their own needs and the goals of the National PTA. One of the National PTA's goals is to provide students with the best possible mental and physical education. The group also calls for adequate laws to protect children and young people. In addition, the PTA promotes the welfare of youth in the community, home, and school.

The National PTA conducts programs at the national, state, and local levels. At the national level, projects have dealt with parent education and the prevention of alcohol and drug abuse. The National PTA issues an award-winning magazine, *PTA Today,* as well as planning kits, videos, and pamphlets for use by local units.

State branches of the National PTA are located in all 50 states, in Washington, D.C., and in Europe and Japan for U.S. military personnel in those countries. Membership in local units is open to anyone who wants to help the association achieve its goals. A person who joins a local PTA or PTSA automatically becomes a member of the state branch and the national organization.

The National Congress of Parents and Teachers was founded as the National Congress of Mothers in 1897. State branches were organized the same year. The organization has more than 7 million members. The

group's headquarters are located in Chicago.

National Consumers League is an organization founded in 1899 to develop a sense of responsibility for the promotion of safety, health, and economic welfare of consumers and workers. The league worked for child labor laws, the elimination of sweatshops, the 8-hour day for women, social insurance, and national health insurance for the elderly under Social Security. The league introduced the idea of minimum wage laws in the United States. It also worked for the establishment of the Food and Drug Administration, meat inspection, and other consumer protection legislation.

Today, the National Consumers League works to promote affordable health care, awareness of hazardous chemicals used in jobs and in the community, food and drug safety, fair tax policies, child labor laws, and consumer protection. Its headquarters are in Washington, D.C. Critically reviewed by the National Consumers League

National Council of Churches is an organization of 32 United States Protestant and Orthodox denominations with a combined membership of 42 million. Its members promote Christian unity, working together on programs that serve the churches and wider society. Much of the council's work is done overseas. It includes disaster relief and refugee assistance. The council carries out many ministries, including education, social justice, theological dialogue, and interfaith relations.

A 270-member governing board meets twice a year to set council policy. A little over half its members are clergy of member churches. The others are lay leaders.

The council was formed in 1950 by 29 member denominations and through the merger of 14 interdenominational agencies. Its full name is the National Council of the Churches of Christ in the U.S.A. The council publishes a monthly newsletter called *Ecu-Link.* Headquarters are in New York City.

National Council of La Raza is an organization that aims to improve life opportunities for Hispanic Americans. The council addresses such issues as poverty, discrimination, health, and education. It is the largest Hispanic organization in the United States, serving Hispanic nationality groups in all parts of the country. The organization began in 1968.

The National Council of La Raza uses two main approaches to meet its goals. First, it provides *capacity-building assistance* to community-based Hispanic organizations. Its help in management, programming, and resource development enables smaller programs to reach greater numbers of people. Second, the council conducts research and analysis on matters of government policy and public concern. It publishes many materials and holds frequent media activities to raise awareness of Hispanic issues.

The organization takes its name from the writings of Mexican scholar José Vasconelos. Vasconelos originally used the term *La Raza Cósnica,* which roughly translates into English as *The Cosmic People.* The phrase reflects the diversity of races and cultures in the Hispanic community. National Council of Senior Citizens (NCSC) is a nonprofit organization that advances the interests of older people in the United States. The NCSC consists of more than 5,000 senior citizen clubs throughout the country. They have about 5 million members.

National Council of Senior Citizens

National Council of Senior Citizens is a nonprofit group that supports the interests of older Americans. *Here,* members are protesting a government proposal to reduce retirement benefits.

The NCSC sponsors housing, community service jobs, and other programs for the aged. It calls for improvements in nursing homes and in the funding for Social Security and health care. In addition, the NCSC supports legislation of general concern, such as antipollution laws. The local clubs help senior citizens with problems, provide social and recreational activities, and sponsor community service projects.

The NCSC was founded in 1961. Its national offices are in Washington, D.C.

Critically reviewed by the National Council of Senior Citizens

National debt is the total amount that the federal government owes because of money it has borrowed by selling bonds or other securities. In Canada, this debt is commonly known as the *federal government debt.* The national debt exists because the government's expenses frequently exceed its income from taxes. In such situations, the government sells bonds to get the extra money that it needs. The government must repay the amount of the bonds on a specified date. In addition, it must pay interest on this indebtedness.

Government debt differs from private debt because the government is not required to post any *collateral* (pledge of security) to guarantee payment of a loan. However, the United States government has always repaid its loans.

Causes of national debt. The United States debt originated in the 1790's, when the newly established federal government assumed debts that the individual states had run up during the Revolutionary War in America (1775-1783). Until the 1980's, wars were by far the most common cause of increases in the United States national debt. For example, the federal debt was only $1 billion before World War I (1914-1918). The war raised it to about $25 billion. By the end of World War II

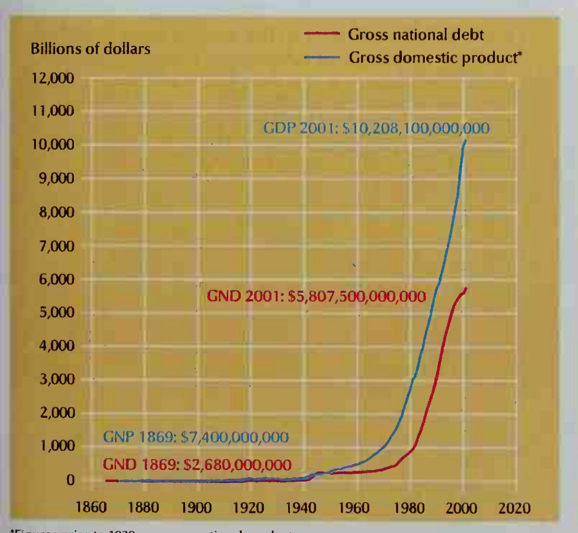
in 1945, the national debt had risen to about $259 billion.

The Korean War in the early 1950's and the Vietnam War in the 1960's and early 1970's caused it to rise sharply again. Between 1980 and 1985, major reductions in taxes and increases in defense spending also contributed to a sharp rise in the debt. By 2000, the U.S. national debt was more than $5 ½ trillion.

Wars have also been responsible for high national debts in other countries. In 1867, the newly formed Dominion of Canada assumed the Canadian debt of $93 million. After increases caused chiefly by Canada's participation in two world wars, the debt totaled about $19 billion in the mid-1940's. By 2000, the Canadian national debt had risen to about $650 billion.

Public improvements also increase the national debt. These include such long-lasting improvements as canals, highways, and dams. Some of these public works yield enough income to pay the principal and interest on the bonds issued to finance them. Other projects, such as roads, benefit the nation but generally do not yield income.

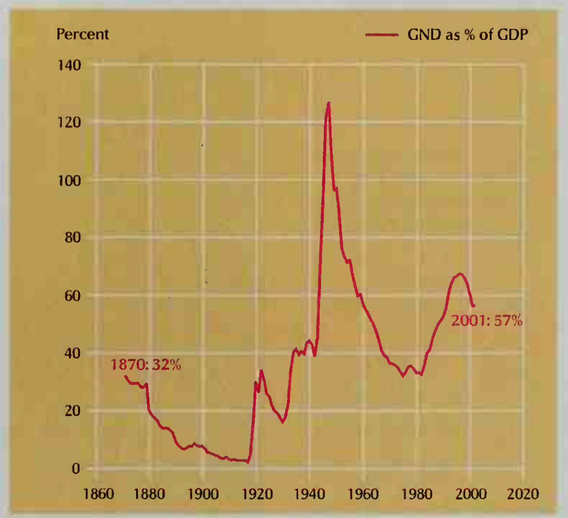
Ownership of the debt. About a fourth of the national debt is held by government agencies. However, banks and private individuals are the largest owners of the debt. Banks and insurance companies buy government bonds as a safe investment and to earn interest on funds not used for other purposes. Individuals also buy bonds for family security and for patriotic reasons. During World War II, millions of Americans bought war bonds. In addition, businesses buy government bonds when they have extra cash that they wish to keep in a safe place while it earns interest. For those who wish to invest for a short time only, the government issues securities known as *Treasury bills* that mature after 13, 26, or 52 weeks. These securities must be repaid out of income from taxes or from sales of newly issued bills to other investors. Banks and businesses buy most Treasury bills.



Debt policy. It is important to consider the national debt in relation to the nation's total economic strength. One way of doing this is to compare the national debt to the *gross domestic product* (GDP). The GDP is the total

United States gross national debt and economic growth since the Civil War (1861-1865)

The gross national debt of the United States is nearly 2,200 times as large today as it was in 1865. But the U.S. population is only about 8 times as large. As a result, the debt per person is about 270 times as great as it was in 1865. In 1945, the year World War II ended, the national debt exceeded the U.S. gross domestic product (GDP). The GDP is the total value of goods and services produced within a country in a year. Today, the debt is nearly three-fifths of the GDP.



Year	Gross national debt	Debt per person	Gross national debt as percentage of gross domestic product*
1865	$ 2,677,900,000	$ 75	—
1870	2,436,500,000	61	30
1880	2,090,900,000	42	16
1890	1,122,400,000	18	9
1900	1,263,400,000	17	7
1910	1,146,900,000	12	3
1920	24,299,000,000	228	27
1930	16,185,000,000	132	18
1940	42,968,000,000	325	43
1945	$ 258,700,000,000	$ 1,832	122
1950	256,090,000,000	1,688	89
1960	284,090,000,000	1,572	55
1970	370,090,000,000	1,807	37
1980	909,100,000,000	4,070	34
1985	1,817,500,000,000	7,613	45
1990	3,206,600,000,000	12,845	58
1995	5,207,300,000,000	19,576	72
2001	5,807,460,000,000	20,392	57

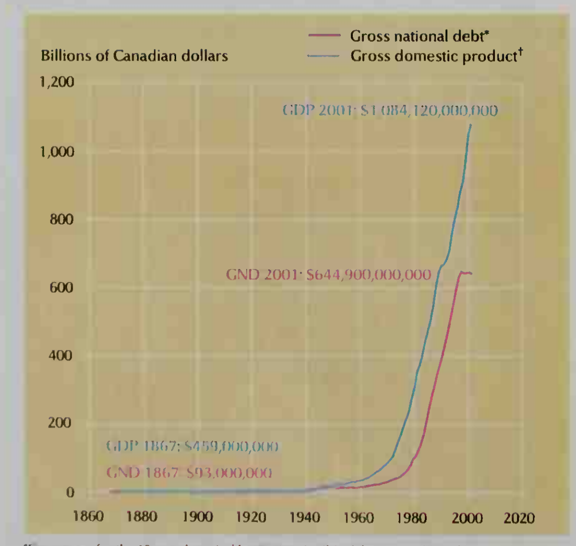
value of goods and services produced within a country in a year. For example, the United States national debt rose from about $259 billion in 1945 to about $5 $\frac{1}{2}$ trillion in 2000. But the 1945 debt amounted to 122 percent of that year's GDP, while the 2000 debt was only about 62 percent of the 2000 GDP.

Some people argue that, just as in a family or business, federal government spending should be kept equal to or below its income. Others declare that this comparison is misleading. They point out that, except for the small portion of the debt held by people in other countries, the debt's size is not as important as the effects that increasing or reducing the debt might have on the economy. Both groups usually agree that taxes in prosperous times should be high enough to cover government spending and to reduce the debt.



Those who call for a balanced budget would not favor measures that would increase the national debt if a recession occurred or threatened to occur. But members of the second group would urge government borrowing to pay for public improvements as a sound way to prevent or end recession. They believe it is the government's responsibility to take such action to stimulate business activity, thereby creating more jobs to reduce unemployment. Thomas F. Dernburg

National Defense Education Act (NDEA) is a law enacted by the United States Congress in 1958. It was one of the most significant education bills in U.S. history. The NDEA provides financial aid to states, educational institutions, and individuals to improve educational programs in the United States.

The NDEA provides federal loans to students who show financial need. Students working on bachelor's degrees may borrow money for their education. NDEA also will lend money for vocational education. Repayment begins after the student leaves school. The borrower has a number of years to repay the loan but must pay a certain amount every month. A borrower who enters certain fields of teaching or teaches in certain schools may have part of the debt canceled.

The NDEA also provides funds for states to buy teaching equipment in science, mathematics, language, English, reading, history, civics, and geography. Private schools also can borrow money for this purpose. Other NDEA programs include graduate fellowships, research into the use of communications media for educational purposes, the improvement of counseling and testing programs, expanded teacher-training programs in critical subjects, and the improvement of vocational education. States must match federal funds in order to get NDEA funds. The NDEA is administered by the United States Department of Education. Douglas Sloan

National Education Association of the United States (NEA) is the largest professional education organization in the world. The NEA has more than 2 million members, most of whom are teachers. The organization's main goals include improving public education and classroom conditions in the United States, and increasing the salaries and benefits of school employees. It works toward these goals through professional activities, judicial and legislative efforts, and collective bargaining. In 1979, the NEA was instrumental in the creation of the U.S. Department of Education.

The NEA has affiliates in every state and in Puerto Rico. It also represents U.S. citizens who teach overseas. Delegates from state and local associations meet annually in a Representative Assembly to establish the NEA's policies. A board of directors and an executive committee act for the NEA between the assembly's sessions.

The history of the NEA can be traced back to 1857, when 43 leaders from state teachers' associations organized the National Teachers Association. In 1870, this group merged with the Association of School Superintendents and the American Normal School Association to form the National Educational Association. For many years, school administrators provided much of the NEA leadership. However, by the mid-1960's, classroom teachers held almost all offices in the NEA. The NEA re-

quires that teachers make up at least 75 percent of the members of each committee. The NEA also has a program for college students preparing for careers in education.

The NEA publishes a number of periodicals, including *NEA Today,* a monthly newspaper. It also publishes books, filmstrips, and leaflets, and materials for American Education Week. The NEA's headquarters are at 1201 16th Street NW, Washington, DC 20036.

National Farmers Organization (NFO) is an organization set up by farmers and ranchers to negotiate prices and other terms of sale for their *commodities* (products). The NFO's main form of negotiation is *collective bargaining,* in which it negotiates on behalf of many farmers and ranchers at once.

The NFO also uses *risk management* techniques to decrease the chance that its members will lose money. In one such technique, called *forward contracting,* the buyer signs a contract to pay a certain price for an agricultural commodity. The agreement occurs well before the commodity is actually produced. Forward contracting protects the farmer against loss if the market price of the product falls after the contract is signed.

The NFO collects payments from buyers and distributes shares of the money to its members. In addition, the organization provides reserve funds to protect members in case a buyer does not pay. The NFO also checks the credit quality of potential buyers.

The National Farmers Organization was set up in 1955. National headquarters are in Ames, Iowa.

National forest is an area set aside by the United States Congress to be protected and managed by the federal government. The Forest Service, a part of the Department of Agriculture, manages 156 national forests in the United States and Puerto Rico. These forests cover an area of about 180 million acres (73 million hectares), nearly as large as the states of California and Nevada combined. Many of the forests are named for Indian tribes or for famous people in American history.

Uses. Originally, the national forests served primarily as a source of timber and water. Today, the Forest Service manages these areas, along with the country's national grasslands, to maintain a continuous supply of a wide variety of resources. These resources include wood, water, and such minerals as lead and uranium; grazing land for cattle and sheep; and recreational areas. The lands also serve as a home for wildlife. The national forests and grasslands together have nearly 60 percent of the wildlife in the nation.

U.S. Forest Service

Managing the national forests is difficult because of their many competing uses. Through public involvement, partnerships linking the Forest Service with environmental and industry groups, and volun-

Bob and Ira Spring

Wenatchee National Forest in western Washington has many scenic trails for horseback riders and hikers.

teer programs, citizens can participate in caring for and managing these areas.

Administration. A *forest supervisor* administers each national forest. The forests are divided into *ranger districts,* each headed by a *district ranger.* A ranger's first duty is to manage all forest uses and services. These include production of wood, water, forage, wildlife, and resources for outdoor recreation. The ranger is also responsible for protecting the forests from such threats as fire, harmful insects, and disease.

United States national forests are grouped into nine regions. Regional foresters head each region. They direct the work of the forest supervisors in their regions. The regional foresters, in turn, report to the chief of the Forest Service in Washington, D.C.

History. Early settlers in the United States adopted the first conservation laws. Nevertheless, destruction of forests became widespread during the settlement of the United States. In 1891, Congress established the first national forest-conservation policy. In that year, Congress authorized the president to set aside areas known as *forest reserves.* The first one was established in Wyoming. In 1907, the name was changed to national forests.

National Foundation-March of Dimes. See March of Dimes Birth Defects Foundation.

National Foundation on the Arts and the Humanities is an independent agency of the federal government. The foundation develops and promotes a national policy of support for the humanities and the arts.

The foundation is administered by a National Endowment for the Arts and a National Endowment for the Humanities. Each endowment is guided by a council composed of 26 private citizens distinguished for their knowledge and experience in the two allied cultural areas, the arts and the humanities. A Federal Council on the Arts and the Humanities coordinates the foundation's activities with related federal agencies.

The Arts Endowment is authorized to assist individuals and nonprofit organizations in a wide range of artistic endeavors. Additional funds are authorized to aid activities in the arts that are sponsored by the states. The Humanities Endowment also makes grants to its state councils. It directly supports projects in education, public programs, preservation, research, and scholarship in the humanities.

Each endowment is headed by a chairperson, who serves on the federal council, along with representatives of federal agencies whose programs are related to the arts and humanities. The foundation was established in 1965. It is located in Washington, D.C.

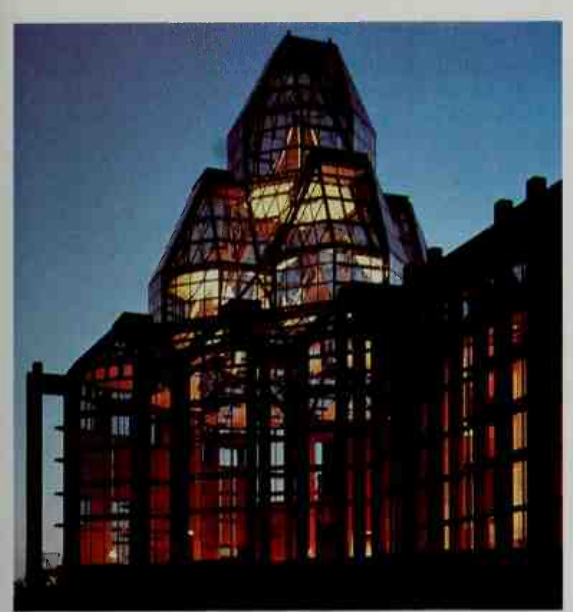
National Gallery of Art, in Washington, D.C., is one of the world's leading art museums. Its collections begin with works from the 1100's and represent some of the Western world's greatest achievements in painting, sculpture, and the graphic arts. The collections are especially rich in European Old Master paintings and American, British, French, Italian, and Spanish paintings of the 1700's and 1800's. The museum also displays sculptures from the late 1100's to the present, medals and bronzes from the early 1400's to the early 1900's, and porcelain from China. In addition, it has over 75,000 works of graphic art from the 1100's to the present.

© Lee Snider, Corbis

The National Gallery of Art East Building was designed by the Chinese American architect I. M. Pei. A sculpture group by the American sculptor Tony Smith stands in front of the building.

The National Gallery of Art was established in 1937, when American financier Andrew W. Mellon gave most of his magnificent art collection to the government. He also provided money to construct the museum's original building, now called the West Building. American architect John Russell Pope designed the marble neoclassical structure. It opened in 1941. The East Building, designed by Chinese American architect I. M. Pei, was completed in 1978. It houses the museum's growing collection of art from the 1900's. It also includes offices, a library, a sculpture garden, space for temporary exhibitions, and the Center for Advanced Studies in the Visual Arts.



All the works in the gallery have been donated or bought with private funds. Major donations include the collections of Samuel H. Kress, Rush H. Kress, Joseph Widener, Chester Dale, Ailsa Mellon Bruce, Lessing J. Rosenwald, Edgar William and Bernice Chrysler Garbisch, Paul Mellon, and the Mark Rothko Foundation.

The National Gallery of Art is affiliated with the Smithsonian Institution, but it is governed by its own board of trustees. The museum receives operating funds from Congress. Critically reviewed by the National Gallery of Art

National Gallery of Canada, in Ottawa, Ontario, exhibits the most important collection of Canadian art in Canada. The gallery also has important collections of American, Asian, and European art. It houses more than 40,000 works, including paintings, sculptures, prints, drawings, photographs, videotapes, and films.

Major donations to the gallery include the Massey Collection of English Painting, the Henry Birks Collection of Canadian Silver, the Bronfman Gift of Drawings, and the Heeramaneck Collection of Southeast Asian Art. The gallery also includes a fine arts reference library. In addition, the gallery provides guided tours and lectures on its collections and exhibitions.

The National Gallery was founded in 1880 to display a collection of works by members of the Royal Canadian Academy of Arts. Before moving to its present location, the gallery had been housed at a series of temporary sites, none of which was designed for the gallery's special needs. Today, the gallery is housed in a three-story

National Geographic Society is the world's largest nonprofit scientific and educational organization. It was formed in 1888 to gather and spread geographic information throughout the world. It has more than 10 million members in approximately 185 countries. The society has sponsored and supported more than 4,000 expeditions and research projects.

The society distributes information through *National Geographic Magazine,* a monthly journal; *National Geographic World,* a magazine for children; *Research and Exploration,* a scholarly research journal; *National Geographic Traveler,* a travel magazine; authoritative books; and an information service for the press, radio, and television. It produces atlases, globes, maps, filmstrips, computer and videodisc programs for schools, and television programs. The society also sponsors a program to train geography teachers and promote the teaching of geography to classrooms.

Among the projects the National Geographic Society has helped sponsor are the historic polar expeditions by Richard E. Byrd and Robert E. Peary. The society also helped back the first successful United States expedition to the top of Mount Everest and aided in the discovery of the wreckage of the sunken *Titanic.* It also sponsored excavations in east Africa that uncovered fossils of primitive human beings who lived about 2 million years ago. The National Geographic Society's headquarters are located in Washington, D.C.

National Guard is one of the organizations of the United States Army and Air Force. An outgrowth of the volunteer militia that was first authorized in 1792, the National Guard is a reserve group. Other civilian reserves, such as the Army, Air Force, and naval reserves, have no connection with the National Guard.

National Guard Bureau emblem

Each state, each territory, and the District of Columbia has its own National Guard. The National Guard Bureau of the Department of the Army directs Army units. The Department of the Air Force supervises Air National Guard units. About 350,000 men and women serve in Army units of the National Guard. About 110,000 serve in the Air National Guard.

Members of the National Guard enlist voluntarily and are formed into distinctive units. The Army and Air Force supervise the training of the National Guard. State funds provide armories and other storage facilities. Federal funds provide clothing, weapons, and equipment.

During peacetime, National Guard personnel attend one weekend of training each month. They also receive two weeks of field training every year. The federal government pays them for the time they spend training. About 80,000 members serve full-time to help organize, administer, recruit, and train the National Guard.

Guard members have a *dual status* because they take an oath of allegiance to their state and to the federal government. Until 1903, the state controlled the militia units. The President had to call units into federal service through the governors of the states (see **Militia**). The National Defense Acts of 1920 and 1933 extended federal authority. Since that time, the President may order units to active duty for up to two years upon declaring a national emergency, or for up to six months without declaring a national emergency. State governors may order units to active duty during emergencies, such as strikes, riots, and disasters. Joel Slackman

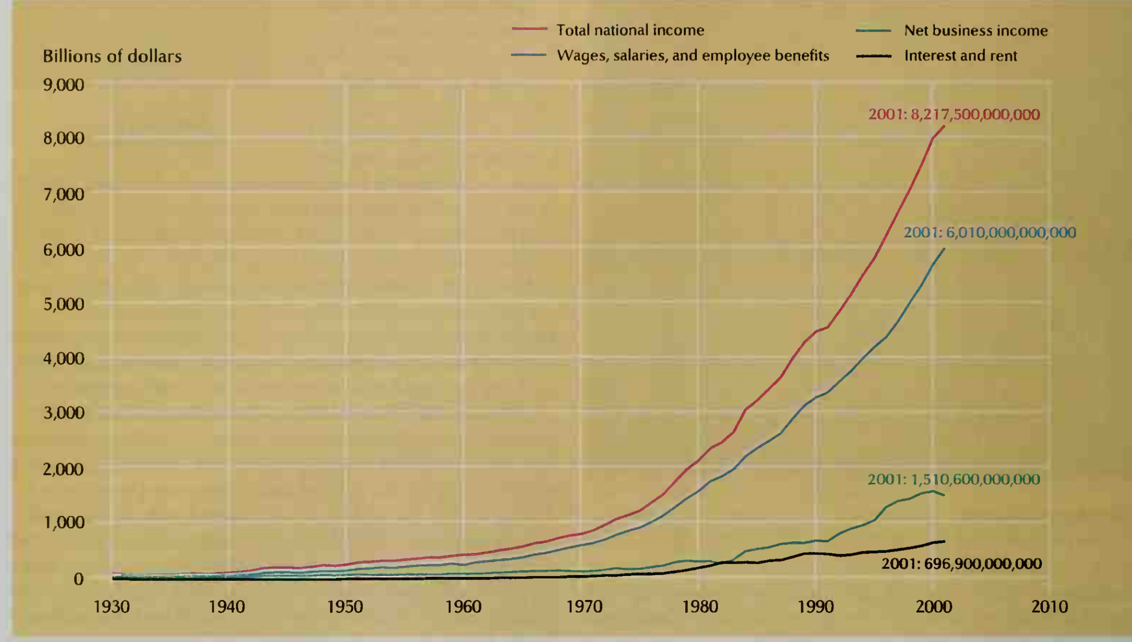
National Hockey League. See Hockey.

National Honor Society is an organization for high school students. Members are chosen on the basis of scholarship, leadership, service, and character. College scholarships are awarded each year to top-ranking senior members. The society is sponsored by the National Association of Secondary School Principals, which founded it in 1921. In 1929, the National Junior Honor Society was founded for students in middle-level schools. The senior society has about 16,000 local chapters; the junior society, 7,000. Both have headquarters in Reston, Virginia.



Critically reviewed by the National Honor Society

National income is the total of all income earned in a nation during a specific period, usually a year. This figure shows whether a nation's economy is growing or declining. Economists use national income figures to compare the economies of various nations.

Determining national income. Economists calculate national income in either of two ways. One way is based on what individuals and businesses earn. The other is based on the production of goods and services. Each method provides the same national income figure because the amount that people earn equals the value of the goods and services produced.

United States national income

National income has risen sharply since the depression of the 1930's. This graph shows how much of the rise comes from the income of employees, the income of businesses, and interest and rent.

Source: U.S. Bureau of Economic Analysis.

National income based on earnings includes all the income earned in a nation during a certain period. This income consists of wages and salaries, interest, profits, and rents.

To find national income based on production, economists first determine a nation's *gross national product.* This figure represents the total value of the goods and services produced by a nation during a specific period. Economists find the national income by subtracting *depreciation* and *indirect business taxes* from the gross national product. Depreciation includes the normal decline in the value of buildings and machinery as a result of doing business. Indirect business taxes are paid by buyers of goods and include sales and excise taxes. The difference between gross national product and depreciation is called the *net national product.*

National income may be affected by both *inflation* (rising prices) and *deflation* (falling prices). For example, if the amount people earn increases 10 percent in one year, the national income figure for that year will rise 10 percent. But if prices also rise 10 percent, people will not be able to buy any more goods or services than they did during the year before. Thus, the national income figure is 10 percent higher because of inflation, not because of economic growth.

In order to compare national income figures for two or more years, economists adjust the national income to include inflation or deflation. The adjusted figure is called *real national income.*

Importance of national income. National income figures show the rate at which a nation's economy changes. These figures also show the stability of the economy. For example, the economy may be unstable if national income varies greatly from year to year. National income figures also show how income is distributed in the forms of wages, interest, profits, and rent. In the United States, wages, salaries, and employee benefits account for about 70 percent of the national income. Interest, profits, and rent provide the rest of the national income.

Both government and industry adjust their budgets in terms of the level, distribution, and rate of change in national income. If national income falls, for example, the government might decrease taxes in order to allow people more after-tax income to spend. If people spent this additional income on goods and services, business activity would rise. As a result, more jobs would be created, and national income would increase.

National income figures include only payments and losses for which records are kept. As a result, these figures do not fully show the level of a nation's well-being. A homemaker receives no salary for doing housework, and so his or her work does not raise the national income. On the other hand, environmental pollution causes great economic loss. But no one knows the total cost of this loss, and so economists cannot subtract it from the national income.

Changes in national income. National income varies, depending on the efforts of workers, the level of employment, and the quality and quantity of *fixed capital.* Fixed capital includes the buildings and machinery used to provide goods and services. Improvements in fixed capital may create more jobs and raise the national income. National income in the United States has generally risen from year to year. It has increased mainly because of additions to fixed capital, growth of the labor

force, and improvements in the efficiency of both capital and labor. Thomas F. Dernburg

National Industrial Recovery Act. See New Deal (Helping industry and labor).

National Institute for Occupational Safety and Health (NIOSH) is an agency of the United States Department of Health and Human Services. The institute's investigators study working conditions to determine the causes of employee illness and accidents. These investigations are often conducted at the request of employees or employers. NIOSH also recommends standards to control hazards on the job. It reports its findings to the Occupational Safety and Health Administration (OSHA), which establishes and enforces the standards.

NIOSH submits recommended standards that are determined by studies of worker exposure to dangerous chemicals or radiation, excessive noise, and other conditions on the job. The agency also examines existing health and safety policies in factories and businesses and develops methods to evaluate job hazards. Its duties also include approving respirators and other personal safety equipment and providing job safety and health training for employers and employees. NIOSH was created by the Occupational Safety and Health Act of 1970.

National Institute of Standards and Technology is an agency of the United States Department of Commerce. The institute, often called NIST, develops measurement standards and techniques for American science and industry and for other government agencies. NIST also helps U.S. companies adopt new technologies to increase their international competitiveness.

The institute works to maintain, improve, and apply fundamental systems of measurement, including those of length, time, and mass. It compares and coordinates its measurement standards with those of other countries by working with international agencies. Although the institute has no regulatory authority, it helps private organizations promote the establishment of voluntary standards for commerce and industry.

NIST provides research and technical services in such areas as computer science and technology, materials science, building and fire safety, electronics, and automated manufacturing. Published information on the agency's research can be obtained from the National Technical Information Service of the Department of Commerce.

NIST was established as the National Bureau of Standards in 1901 and became part of the Department of Commerce in 1903. The agency received its present name in 1988.

National Institutes of Health (NIH) is an agency of the United States government. It is part of the Public Health Service of the Department of Health and Human Services. NIH conducts and supports a broad range of biomedical research and provides funds for the training of research scientists. It also classifies and distributes biological and medical information.

NIH conducts research at its laboratories in Bethesda, Maryland. There are 18 NIH institutes. They deal with (1) aging; (2) alcoholism; (3) allergy and infectious diseases; (4) arthritis and musculoskeletal and skin diseases; (5) cancer; (6) child health and human development; (7) deafness and other communication disorders; (8) dental research; (9) diabetes and digestive and kidney diseases; (10) drug abuse; (11) environmental health sciences; (12) the eye; (13) general medical sciences; (14) the heart, lungs, and blood; (15) human genes; (16) mental health; (17) nursing; and (18) neurological disorders and stroke. The Magnuson Clinical Center, a research hospital, serves the institutes. NIH also includes the National Library of Medicine; the Fogarty International Center for Advanced Study in the Health Sciences; the Center for Complementary and Alternative Medicine, and three support divisions that deal with information technology, research resources, and scientific review.

NIH traces its history to 1887, when the Hygienic Laboratory was set up at the U.S. Marine Hospital on Staten Island. The agency adopted its present name in 1948.

National Labor Relations Act, usually called the *Wagner Act,* is a law that guarantees the right of workers in the United States to form unions. It also ensures the right of employees to engage in *collective bargaining*—that is, to negotiate as a group with employers about wages, hours, and working conditions.

The rights of workers were originally protected by the National Industrial Recovery Act (NIRA) of 1933, which the Supreme Court declared unconstitutional in 1935. The Wagner Act was passed later that year to reaffirm those rights. Its main sponsor was Senator Robert F. Wagner, a New York Democrat.

The Wagner Act bans certain practices by employers. For example, it prohibits them from interfering with union efforts to bring workers into unions. The act also requires employers to negotiate with representatives elected by workers. The act established the National Labor Relations Board (NLRB) to enforce such provisions (see **National Labor Relations Board**).

The Wagner Act enables employees of individual companies to decide which union or person will negotiate for them. A worker or employer may request the NLRB to conduct an election among the workers to choose a representative. The employer must then bargain only with the elected representative.

Many employers believed the Wagner Act gave unions too much power. They complained that it allowed unions to force a business to hire only union members. Such a business is called a *closed shop.* The Taft-Hartley Act of 1947 amended the Wagner Act and outlawed some union activities. James G. Scoville

See also **New Deal; Taft-Hartley Act.**

National Labor Relations Board (NLRB) was created as an independent agency by Congress in 1935 to administer the National Labor Relations Act, often called the *Wagner Act.* The NLRB works to correct or prevent unfair labor practices committed by either employers or unions. When a union represents 30 percent or more of a group of employees covered by the National Labor Relations Act, the NLRB conducts secret-ballot elections to determine whether employees wish to be represented in collective bargaining.

The president of the United States appoints the five board members and the general counsel, with the consent of the Senate. Each board member serves a five-year term. The general counsel has a four-year term. The NLRB's main offices are located in Washington, D.C. Petitions for elections and charges of unfair labor practices are filed at regional offices. James G. Scoville

See also **Industrial relations; National Labor Relations Act.**

National laboratory is any one of nine major scientific laboratories owned and supervised by the United States Department of Energy. The laboratories do work for that department and for other federal agencies, such as the Department of Defense, National Research Council, and Environmental Protection Agency. Activities at the laboratories range from fundamental research intended to provide a better understanding of the universe to applied programs in national security, energy, and conservation. Research at the facilities has led to advances in such areas as nuclear power and nuclear medicine. Today, the laboratories are also studying human genetics, superconducting materials, fusion energy, global environmental change, and computers. In addition, the laboratories conduct programs for students and teachers to improve science education at all levels.

The national laboratories are operated by employees on contract from universities and private industries. Physicists, chemists, engineers, and environmental scientists often work as a team to pursue the solution to scientific problems. University faculty and students and industrial scientists also often work with the scientists at the laboratories.

Some of the laboratories developed as nuclear research centers during World War II (1939-1945). For example, a team of scientists created the first controlled, self-sustaining nuclear chain reaction at the University of Chicago in 1942. A few months later, the scientists moved the experiment to a site that was to become Argonne National Laboratory. Toni Grayson Joseph

National League. See **Baseball** (Major leagues; Professional baseball).

National League of Cities is the largest organization that represents United States cities. Membership is open to all cities and state federations of cities.

The league works to improve the quality of life for people who live in cities and to strengthen local government. Its officials discuss urban problems with members of Congress, officials in the executive branch, and other leaders to win support for a national urban policy. The organization sometimes takes legal action in federal courts on matters involving cities. It publishes a weekly newspaper called *Nation's Cities Weekly* and various reports on city policies and procedures. The league holds an annual convention called the Congress of Cities that is attended by mayors, city managers, council members, and other city officials. At this meeting, league members review, amend, and approve the organization's national municipal policy.

The history of the league dates back to 1924, when leaders of 10 state federations of cities formed the American Municipal Association. The organization changed its name to the National League of Cities in 1964. Its headquarters are in Washington, D.C.

National Mediation Board is a United States government agency that administers the Railway Labor Act. This law, enacted in 1926, governs labor-management relations in the railroad and airline industries. The board's two main functions are (1) to ensure the right of employees to organize into free and independent labor organizations, and (2) to help settle disputes over wages, rules, and working conditions.

In a dispute, either side may ask the board to *mediate* by suggesting solutions. The board may also enter the dispute without invitation. If mediation fails, the board asks the two sides to accept voluntary *arbitration.* If the parties agree, the board appoints a referee, whose decision is binding. If the parties refuse to arbitrate, the board formally notifies them that it has not been able to settle the dispute. A 30-day *cooling-off period* then follows while the board tries to settle the dispute. If an agreement is not reached by the end of this period, the parties are free to act on their own. As a last resort, the president of the United States may establish an emergency board to help end the dispute.

Congress created the board in 1934. It has three members, who are appointed by the president subject to the approval of the Senate.

National Museum of American History features exhibits on the social, cultural, scientific, and technological development of the United States. The museum, located in Washington, D.C., has more than 17 million items. It also conducts educational and research work. It is a bureau of the Smithsonian Institution.

The museum's collection includes displays of the cultural, military, and political development of the United States. Visitors can see George Washington's wartime field headquarters, the desk at which Thomas Jefferson wrote the first version of the Declaration of Independence, and the flag that inspired Francis Scott Key to write "The Star-Spangled Banner" (see **Star-Spangled Banner** [picture]).

The technology section features scientific and technological exhibits. These displays include Alexander Graham Bell's first telephone, Elias Howe's first sewing machine, and Samuel F. B. Morse's first telegraph.

The National Museum of American History originally formed part of the U.S. National Museum. In 1964, the history and technology items were put on display in a new building called the National Museum of History and Technology. The museum was renamed the National Museum of American History in 1980. It is supported by annual grants from Congress.

Critically reviewed by the National Museum of American History

National Museum of Natural History ranks as one of the world's major centers for the study of the natural sciences. The museum consists of the United States government's collections of items relating to human beings, the earth and its environment, and outer space. In addition, the museum carries on educational and research work. It is in Washington, D.C.

Research conducted at the museum contributes to the advancement of medical knowledge, agricultural and mineral production, and environmental conservation. The museum houses exhibits on such subjects as the cultures of the Americas, the Pacific, Africa, and Asia; the evolution of human beings; dinosaurs and other fossils; and the ice age. The museum also has displays of gems and minerals, moon rocks, meteorites, mammals, birds, and marine life. Special features at the museum include a live insect zoo, a living coral reef, a naturalist center, and a "discovery room" where people of all ages can handle natural history specimens.

The museum is a branch of the Smithsonian Institution, which was founded in 1846. The American naturalist Spencer F. Baird began to develop the natural history collections during the 1850's. The collections have grown to more than 119 million items. The National Museum of Natural History is supported largely by annual grants from Congress.

National Naval Medical Center, in Bethesda, Maryland, is the largest United States Navy facility for medical care, research, and training. It covers 242 acres (98 hectares) about 10 miles (16 kilometers) northwest of Washington, D.C. The National Naval Medical Center includes a hospital, medical and dental schools, and a school of hospital administration. It opened in 1942. The first nuclear reactor installed in a hospital solely for medical use was dedicated at the center in 1957. W. W. Reid

National Oceanic and Atmospheric Administration (NOAA) is an agency of the United States Department of Commerce that works to improve knowl-

edge and use of the environment. It is responsible for forecasting the weather, for managing ocean resources, for providing various oceanic and atmospheric services, and for undertaking research relating to oceans and the atmosphere.

NOAA's major organizations include the National Environmental Satellite, Data and Information Service; the National Marine Fisheries Service; the National Ocean Service; the National Weather Service; and the Office of Oceanic and Atmospheric Research.

The agency was created in 1970. Its headquarters are in Washington, D.C. Critically reviewed by the National Oceanic and Atmospheric Administration

See also **Weather Service, National.**

National Optical Astronomy Observatories (NOAO) are a group of astronomy research centers funded by the United States government. The NOAO consists of three observatories. The observatories are Kitt Peak National Observatory near Tucson, Arizona; Cerro-Tololo Inter-American Observatory in northern Chile; and the National Solar Observatory in Arizona and New Mexico.

The NOAO was established in 1984 to combine the nation's major centers for *optical astronomy* into a single organization. Optical astronomy involves the use of *optical telescopes,* which capture visible light and *infrared* (heat) radiation to form images of the sun, planets, stars, galaxies, and other celestial objects.

The NOAO provides major research facilities to astronomers. Any astronomer can apply for time on NOAO telescopes to carry out research. In addition, the NOAO maintains a staff of astronomers who improve and develop the observatories' instruments, as well as conduct research.

Kitt Peak National Observatory is on Kitt Peak, about 60 miles (95 kilometers) southwest of Tucson. The observatory has 16 optical telescopes, the world's largest collection. Its biggest telescope is the 4-meter Mayall telescope, which contains a mirror 158 inches (4 meters) in diameter. Between 300 and 400 astronomers from throughout the United States and other countries use Kitt Peak facilities each year.

Cerro Tololo Inter-American Observatory is on Cerro Tololo, a mountain about 50 miles (80 kilometers) east of La Serena, Chile. The observatory's 158-inch (4-meter) telescope is one of the largest optical telescopes south of the equator. Astronomers at the observatory study celestial objects that cannot be seen from the Northern Hemisphere.

The National Solar Observatory, based in Tucson, conducts studies of the sun. It operates the Vacuum Tower telescope and other telescopes on Sacramento Peak, New Mexico, and the Robert R. McMath solar telescope and a vacuum telescope at Kitt Peak. Vacuum telescopes are enclosed in a vacuum chamber to eliminate the air turbulence produced inside other telescopes by the sun's heat. The McMath telescope is the world's largest solar telescope, with a mirror 60 inches (1.5 meters) in diameter. It produces an image of the sun about 30 inches (75 centimeters) in diameter.

The NOAO also conducts special programs in astronomy. One such program, called the Global Oscillation Network Group Project (GONG), uses a worldwide network of automated observatories to continuously study vibrations on the sun's surface. The NOAO's United States Gemini Program participates in an international partnership that operates two 319-inch (8.1-meter) telescopes. The Gemini North telescope is on Mauna Kea in Hawaii, and the Gemini South telescope is on Cerro Pachón, near Cerro Tololo in central Chile.

The NOAO is operated by the Association of Universities for Research in Astronomy, Incorporated (AURA), which consists of 21 U.S. universities. AURA is under contract to the National Science Foundation, a federal agency.

Critically reviewed by the National Optical Astronomy Observatories

See also **Sun** (History of modern solar study); **Telescope.**

National Organization for Women (NOW) is one of the largest associations in the United States devoted to achieving full equality between women and men. NOW pushes for equality through elections and legislation as well as through rallies, demonstrations, and marches. The organization has hundreds of thousands of members in chapters throughout the nation. Almost all the members are women.

NOW seeks to increase the number of women in policymaking positions in government, businesses, schools, and other institutions. It works to replace male elected officials with women who support equality between the sexes. NOW also calls for giving women equal access to jobs, pensions, and Social Security benefits. It tries to ensure that women get the same pay as men for similar work.

The organization supports legalized abortion and access to birth control. It seeks to guarantee women a right to *prenatal care* (medical care during pregnancy) and child care. NOW also works to protect women against sexual assault and other violence. In addition, it seeks to enable both female and male homosexuals to live in security and with self-respect.

NOW calls for the passage of an Equal Rights Amendment to the Constitution of the United States. The amendment would require that men and women be treated equally by law. NOW's first attempt to win approval of the amendment failed because only 35 of the necessary 38 states had approved it by a 1982 deadline. Since then, the amendment has been reintroduced in Congress a number of times but has not been passed.

Many people, including a large number of women, oppose NOW's goals, its methods, or both. Some of these people object to the organization's support for abortion. Many of NOW's opponents believe that the welfare of society and of the family depends on preserving the traditional roles of men and women. These people criticize NOW for working to change women's roles. Some people dislike NOW's use of rallies, marches, and demonstrations to achieve its goals.

NOW disagrees that its activities weaken society or the family. The organization also points out that it supports the rights of all women, including homemakers, and that it acknowledges homemakers' vital contributions to society and the family.

NOW was established in 1966. Betty Friedan, one of its founders, served as the organization's first president. NOW headquarters are located in Washington, D.C.

Susan Lutz Wallace

Ken Cole, Earth Scenes

A national park is an area set aside to protect natural beauty or other notable features. The magnificent scenery of Banff National Park in Canada includes snow-covered Mount Victoria and sparkling Lake Louise, *above.* Such beauty makes Banff one of the favorite parks in North America.

National park

National park is an area set aside by a nation's government to protect natural beauty, wildlife, or other remarkable features. National parks also preserve places of cultural, historical, or scientific interest. In addition, some parks protect entire environments, such as coral reefs, deserts, grasslands, mountain ranges, or rain forests. Governments create national parks to guard their natural treasures from the harmful effects of farming, hunting, logging, mining, and other economic development.

National parks serve important purposes. Many parks allow us to enjoy and appreciate majestic peaks, sparkling lakes, spectacular waterfalls, and other scenic wonders. Others let us see fascinating wild animals in their natural settings. Still others provide opportunities for boating, camping, hiking, and other forms of recreation. As a means of attracting tourism, national parks are vital to the economies of many nations.

In addition, many national parks foster education by preserving important buildings, battlegrounds, and other features of a nation's cultural and historical heritage. Parks help save endangered animals and plants, and they provide natural laboratories for scientists seeking to understand relationships of animals and plants to their environment. Another goal of many parks is to protect the area's *biodiversity* (variety of plant and animal species). In this way, parks help maintain a healthy balance among species and help preserve the natural processes that support life on the earth.

National parks face a number of challenges. Many park managers must deal with pressures to develop park resources. They also are concerned about *poaching* (illegal hunting), the collection of rare plants, pollution, and overcrowding. Other concerns include the rights of the people who were the parks' original inhabitants, and the wise management of natural forces such as fire and wildlife.

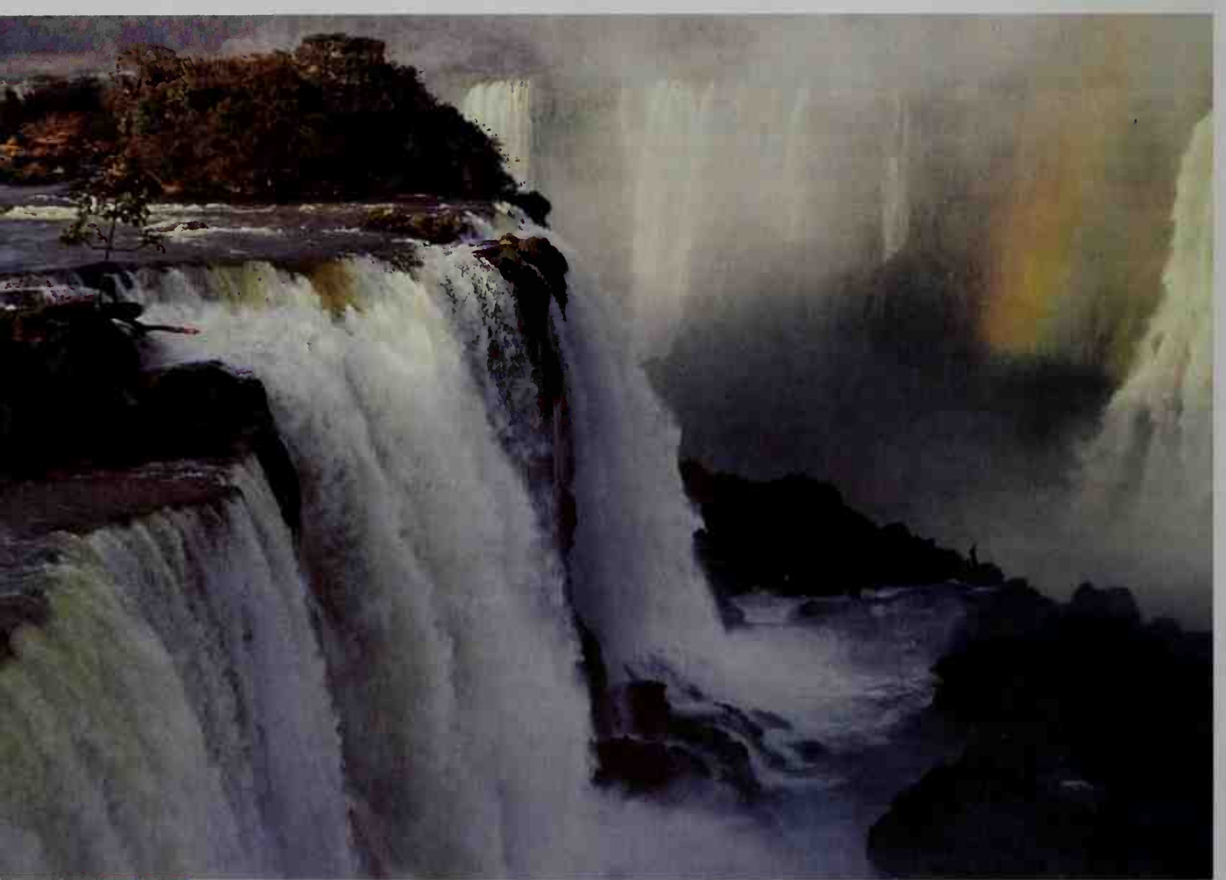
The world's first national park, Yellowstone National Park, was established in the United States in 1872. National parks gradually spread throughout the world. Today, about 1,500 national parks protect about $1\frac{1}{2}$ million square miles (3.9 million square kilometers) in more than 120 countries. Many countries use the term *nature reserves* for areas similar to national parks. There are about 6,000 of these areas. Together, the world's national parks and nature reserves cover an area about the size of the mainland United States.

Craig W. Allin, the contributor of this article, is Professor of Political Science at Cornell College and the editor of International Handbook of National Parks and Nature Reserves.

Notable national park systems

A number of countries have developed important national park systems. These countries include Argentina, Australia, Canada, Japan, Kenya, New Zealand, South Africa, and the United States.

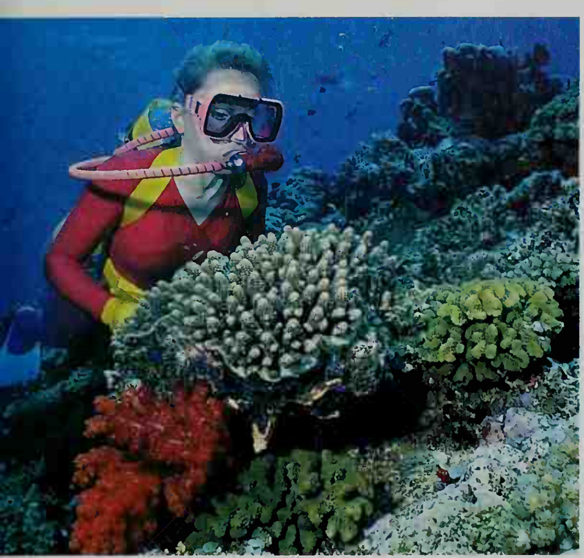
Argentina has about 20 national parks. The parks cover a total of about 10,000 square miles (26,000 square kilometers). The country's first national park, the National Park of the South, was established in 1922 to preserve an area of scenic mountains.



Argentina's national parks protect a huge range of geographical features, plants, and animals. The most notable parks include Nahuel Huapi, Los Glaciares, and Iguazú. Nahuel Huapi was originally called National Park of the South. It took its present name in 1934. It is Argentina's largest national park, covering about 3,000 square miles (7,800 square kilometers). Only slightly smaller is Los Glaciares, which has nine major glaciers. Together, Iguazú National Park in Argentina and Iguaçu National Park in Brazil protect the magnificent Iguaçu Falls and about 900 square miles (2,300 square kilometers) of tropical rain forest. The waterfall actually consists of about 275 separate falls. The combined falls measure about 2 miles (3 kilometers) wide and drop 237 feet (72 meters).

Australia has about 500 national parks. The first one, established in 1879, was National Park (now called Royal National Park). Today, the system extends over 100,000 square miles (275,000 square kilometers).

Australia's history makes its parks especially important to scientists. About 200 million years ago, Australia broke apart from a huge land mass that is now Africa and South America. As a result, Australia's wildlife developed differently from the wildlife on the other continents. Kangaroos, koalas, wombats, and thousands of other animals and many plants are unique to Australia.



Australia's Great Barrier Reef Marine Park and Kakadu National Park are of exceptional interest. Great Barrier Reef, a large group of coral reefs in the South Pacific Ocean, is the largest marine reserve in the world. It extends about 1,400 miles (2,300 kilometers) along Australia's northeast coast. The park is home to about 400 species of coral, 200 kinds of birds, and thousands of different species of fish and shellfish.

Kakadu National Park protects evidence of human life from about 30,000 years ago. This evidence includes one of the world's greatest collections of prehistoric cave paintings. Kakadu is a pioneer in cooperative management. Most of the park belongs to groups of Aborigines, whose members are descendants of hunting and gathering people who were Australia's earliest inhabitants. The Aborigines have leased their lands to the federal government with the understanding that the park will be managed to preserve their traditional ways of life.

Michael Fogden, Oxford Scientific Films from Earth Scenes

The spectacular Iguaçu Falls lies on the border between Brazil and Argentina and forms a part of national parks in each country. The waterfall actually consists of about 275 separate falls. The combined falls measure about 2 miles (3 kilometers) wide and drop 237 feet (72 meters).

Kelvin Aitken, Peter Arnold, Inc.

The Great Barrier Reef Marine Park stretches about 1,400 miles (2,300 kilometers) along Australia's coast. Its approximately 400 species of colorful coral attract many divers.

Canada has about 35 national parks that occupy a total of about 85,000 square miles (220,000 square kilometers). The Canadian system of national parks began in 1885, with land near Banff, Alberta. This area became part of what is now Banff National Park.

Canada has pioneered an *ecosystem* approach to park planning. An ecosystem consists of all the living and nonliving things in a given area and the relationships among them. An area's air, climate, soil, and water are part of its ecosystem. Under the ecosystem approach, Canada's park service has divided the country into about 70 areas, each with a different combination of land, water, plants, and animals. National parks are developed around the relationships among the natural features in each area.

The Canadian park system is exceptionally diverse. Banff, Jasper, Kootenay, and Yoho national parks protect almost 8,000 square miles (20,700 square kilometers) of mountain ecosystem. These four adjacent Rocky Mountain parks have rugged peaks, active glaciers, glistening lakes, thundering waterfalls, and boiling hot springs. The parks are home to grizzly and black bears, bighorn sheep, deer, elk, moose, mountain goats, and dense forests of evergreen trees.

In addition, Canada has begun to develop a system of marine parks to protect underwater environments in the Atlantic, Pacific, and Arctic oceans and in the Great Lakes. Its first national marine park, Fathom Five, was established in 1987 in Lake Huron's Georgian Bay. The bay's cold, clear waters preserve several historic shipwrecks and provide opportunities for recreational divers. For a complete listing of Canada's national parks and historic sites, see **Canada** (National park system).

Japan has about 80 national parks. The parks cover about 13,000 square miles (34,000 square kilometers). The national parks of Japan are rooted in both religion and recreation. Japan's major religions, Buddhism and Shintoism, stress harmony with nature and deep respect for living things. The Japanese people regard forests, islands, mountains, and other places of special beauty as sacred. For centuries, they treated such places as shrines and left them unspoiled. To protect the beauty of Japan's scenic mountains, the government created the country's first national park in 1934. In the mid-1900's, the growing popularity of mountain climbing led to the expansion of Japan's national park system.

Japan's park planners have been challenged by the country's huge population and small area. Japan is one of the most densely populated nations in the world. As a result, little unused land is available for the creation of national parks. Japan's solution has been to establish national parks that include private lands. The government then works with the landowners to save the natural beauty of each area. About a fourth of Japan's parkland is privately owned.

Japan's best-known scenic treasure is Mount Fuji, a beautifully shaped volcano in Fuji-Hakone-Izu National Park. This park lies near Tokyo and other large cities and attracts about 100 million visitors each year.

Kenya has about 30 national parks and reserves. Its national park system covers about 14,000 square miles (36,000 square kilometers) and protects a spectacular variety of wild animals. The national parks of Kenya date to the early 1900's, when colonial governments set aside wildlife reserves mainly to provide sightseeing and hunting opportunities for Europeans. Today, the money spent by tourists visiting the national parks is a major source of Kenya's national income.

Kenya's most famous protected areas include Tsavo National Park and Maasai Mara Game Reserve. Both lie in the grasslands of East Africa. Tsavo is Kenya's largest park. It covers about 8,000 square miles (20,700 square kilometers) and is known for its elephants and rhinocer-

D. & J. Heaton, West Light

Mount Fuji, long considered a sacred place by the Japanese people, stands in Fuji-Hakone-Izu National Park. The beautifully shaped volcano attracts about 100 million visitors each year.

oses. Maasai Mara lies next to the Serengeti National Park in Tanzania. It is home to antelopes, buffaloes, cheetahs, elephants, giraffes, hippopotamuses, hyenas, jackals, leopards, lions, rhinoceroses, and many kinds of birds. Between August and October, hundreds of thousands of migrating zebras and wildebeests from the Serengeti Plain cross into Maasai Mara.

New Zealand has about 15 national parks. These parks cover about 9,000 square miles (23,000 square kilometers). New Zealand's national park system grew from the beliefs and vision of its original inhabitants, the Maori. The Maori feared that Europeans settling in the country in the late 1800's would not respect their sacred volcanoes. In 1887, a Maori chief gave land to the government for a park. The area was expanded and became Tongariro National Park in 1894.

Saving nature has special importance in New Zealand, an island country. New Zealand separated from the other continents about 80 million years ago. When Europeans began arriving in the 1800's, more than half of New Zealand's native plants and animals were unique to the island. But European settlers introduced many new plants and animals to New Zealand. The results have been disastrous for the native species. In many parts of the country, most native plants and animals have been destroyed.

Fiordland, New Zealand's largest national park, has about 15 *fiords* (narrow inlets from the sea) that extend up to 27 miles (43 kilometers) long and about 1,600 feet (500 meters) deep. This park also includes evergreen forests and Sutherland Falls, which drops 1,904 feet (580 meters) and ranks as one of the world's highest waterfalls. The national parks have helped make tourism and outdoor recreation major industries in New Zealand.

South Africa has about 15 national parks. The parks occupy about 12,000 square miles (31,000 square kilometers). The country's first national park, Kruger National Park, was established in 1926. Nature observers have called South Africa's animal population "the greatest wildlife show on earth." Not surprisingly, the history of South Africa's national park system has focused on wildlife protection. Kruger National Park and Kalahari Gemsbok National Park stand out for their enormous size and great variety of wildlife.

Kruger covers about 7,500 square miles (19,500 square kilometers) and may have the largest variety of mammals in any African park or reserve. It has thousands of buffaloes, elephants, impalas, and zebras, as well as hundreds of species of birds and plants. The park's grasslands are home to antelopes, cheetahs, giraffes, hyenas, jackals, leopards, and lions. Crocodiles and hippopotamuses live in the rivers. Kruger has become a world center for wildlife research.

Kalahari Gemsbok National Park was established in 1931 to protect herds of migrating animals. It covers about 3,700 square miles (9,600 square kilometers) and lies next to Gemsbok National Park in Botswana. These parks are famous for their various species of antelopes, including elands, gemsboks, springboks, steenboks, and wildebeests, as well as for cheetahs, hyenas, jackals, and lions.

The United States has about 50 national parks. These parks and over 300 other protected areas in the country's National Park System occupy about 125,000 square miles (325,000 square kilometers). The U.S. government's work in establishing and managing national parks has

Gerald Cubitt

The sprawling Kruger National Park in South Africa is home to thousands of mammals, including impalas and waterbucks, *shown here.* The park covers about 7,500 square miles (19,500 square kilometers) and ranks as one of the leading centers of wildlife research in the world.

served as a model for countries around the world. The opening of Yellowstone National Park in 1872 was soon followed by the creation of many other important national parks. To preserve recreational opportunities in natural settings, the government set aside more than 400 wilderness areas, mostly within national parks, national forests, and national wildlife refuges. For more information on U.S. parks, see **National Park System.**

Other interesting national parks

More than 120 countries have established national parks. A number of these parks are famous throughout the world and attract millions of visitors annually. Tourists are often drawn by the variety of wildlife in a country's national parks. Costa Rica's parks are especially popular because they have more species of birds—about 850—than do the United States and Canada combined. This small country's national parks also protect about 9,000 species of plants.

Many people are attracted by the outstanding features of individual parks as well. Some of these parks are considered world treasures. For example, Nepal's Sagarmatha National Park includes "the peak whose head touches the sky," according to local peoples. Westerners know this majestic, snow-capped peak as Mount Everest, which rises to 29,035 feet (8,850 meters) and is the highest peak in the world. Guatemala's Tikal National Park protects pyramids of the ancient Maya civilization.

Another famous protected area, Ecuador's Galapagos National Park, preserves the natural laboratory that influenced the British biologist Charles Darwin. Darwin's studies there contributed to his famous theory of evolution. England's Lake District inspired the British poet

(Continued on page 42h)

Tikal National Park in Guatemala protects ruins of pyramids and temples of the ancient Maya Indian civilization. This civilization flourished in Guatemala between A.D. 300 and 900.

Interesting national parks throughout the world

By 2000, there were about 1,500 national parks in the world. These parks protected about 1 ½ million square miles (3.9 million square kilometers) in over 120 countries. Examples of interesting national parks throughout the world are described below and on page 42g.

Name	Location	Outstanding features
AFRICA		
Amboseli	Kenya	Views of nearby Mount Kilimanjaro; elephants, leopards, and vervet monkeys
Chobe	Botswana	Giraffes, zebras, elephants, lions, and hippopotamuses
Comoe	Côte d'Ivoire	Elephants
Dzanga-Ndoki/ Nouabalé-Ndoki	Central African Republic/ Congo (Brazzaville)	Gorillas, chimpanzees, elephants; rain forest
Etosha	Namibia	Savanna and woodland surrounding a shallow depression that fills with water in the rainy season; large elephant population, zebras, wildebeests, springboks, other wildlife
Garamba	Congo (Kinshasa)	Habitat for white rhinoceroses and buffaloes
Hwange	Zimbabwe	Woodland and scrub savanna; elephants, buffaloes, giraffes, and zebras
Kabalega Falls (Murchison Falls)	Uganda	Murchison Falls, crocodiles, hippopotamuses, other wildlife
Kalahari Gemsbok/Gemsbok	South Africa/Botswana	Desert area with migrating groups of springboks and gemsboks; lions and cheetahs
Kilimanjaro	Tanzania	Trails to the summit of Mount Kilimanjaro for mountaineers, elands and leopards
Kruger	South Africa	Savanna home to vast wildlife, including buffaloes, giraffes, elephants, and zebras
Lake Malawi	Malawi	Deep-water lake with hundreds of species of fish
Montagne d'Ambre	Madagascar	Volcanic area with crater lakes and waterfalls; tropical forests, lemurs, butterflies
Ngorongoro	Tanzania	Rim of ancient volcanic crater surrounds flat savanna; diverse wildlife
Niokolo-Koba	Senegal	River habitat, bordered by forest and savanna; crocodiles, buffaloes, and gazelles and other antelopes
Ranomafana	Madagascar	Rugged area of rain forest; endangered aye-ayes and ruffed lemurs
Ruwenzori (Queen Elizabeth)	Uganda	Two large lakes; chimpanzees and colobus monkeys, many antelopes
Selous	Tanzania	Elephants, buffaloes, other species
Serengeti/Maasai Mara	Tanzania/Kenya	Migrating zebras and wildebeests; diverse savanna wildlife
South Luangwa	Zambia	Woodland savanna for elephants, giraffes, leopards, other wildlife
Tsavo	Kenya	Largest park in Kenya; major elephant and rhinoceros populations
Victoria Falls/ Mosi oa Tunya	Zimbabwe/Zambia	Magnificent Victoria Falls
Virunga/Volcanoes	Congo (Kinshasa)/Rwanda	Wide variety of habitats, including home of mountain gorillas
ASIA		
Angkor	Cambodia	Protected area for the ancient temples of Angkor
Bandipur/Mudumalai	India	In western Ghat mountains; one of the last strongholds for the Asian elephant
Corbett	India	Forest and grasslands provide habitat for Bengal tigers
Daisetsuzan	Japan (Hokkaido)	Mountainous habitat for brown bear and other wildlife; ski areas and hot springs
Fuji-Hakone-Izu	Japan	Scenic Mount Fuji; lakes; rocky coastline
Gunung Leuser	Indonesia (Sumatra)	Rain forest; rhinoceroses, tigers, orangutans, and the world's largest flower, the rafflesia
Kanha	India	Forests and bamboo thickets in central India; home to much wildlife, including tigers, swamp deer
Karatepe-Aslantas	Turkey	Archaeological site of former Hittite settlement; museum
Kaziranga	India	Elephants, rhinoceroses, wild buffaloes, birds
Keoladeo	India	Wetland for migrating waterfowl
Khao Yai	Thailand	Tropical, evergreen, and deciduous forests, as well as grassland; elephants, deer, and numerous bird species
Kinabalu	Malaysia (Borneo)	Jungle at the base of Mount Kinabalu; tree-level walkway through rain forest
Komodo	Indonesia	Habitat for the endangered Komodo dragon
Manas/ Royal Manas	India/ Bhutan	Foothills of the Himalaya; diverse forests, many bird species; tigers, rhinoceroses, golden langur monkeys
Mount Apo	Philippines (Mindanao)	Sanctuary for the Philippine eagle
Nikko	Japan	Historic shrines and temples, mountainous scenery, rivers, and waterfalls
Royal Chitwan	Nepal	Grassland and forest; diverse animal and bird population, including tigers and rhinoceroses
Ruhuna (also called Yala)	Sri Lanka	Scrub woodland; elephants, spotted deer, and water buffaloes
Sagarmatha	Nepal	Includes Mount Everest, highest peak in the world
Sorak	South Korea	Peak of Mount Sorak; lush valleys and forests; Buddhist temples, waterfalls, and hiking trails
Stolby	Russia (Siberia)	Coniferous forests; granite hills; hiking and climbing
Taman Negara	Malaysia	Ancient tropical rain forest; kingfishers, hornbills, buffaloes, tapirs
Ujung Kulon	Indonesia (Java)	Wilderness for Javan rhinoceroses, leopards, Javan gibbons, and leaf monkeys
Wilpattu	Sri Lanka	Jungle habitat for spotted deer, sloth bears, leopards, other wildlife
Wolong	China	Rugged mountainous area of Sichuan province; forests, bamboo, rhododendrons; endangered giant pandas, red pandas, golden monkeys, takins
Yushan	Taiwan	Remote park, Taiwan serows, Taiwan black bears, Formosan macaques, and emperor pheasants
AUSTRALIA AND NEW ZEALAND		
Blue Mountains	Australia (New South Wales)	River-eroded gorges, waterfalls, eucalyptus forests
Cradle Mountain/Lake St. Clair	Australia (Tasmania)	Native plants, including pandanus; highlands, temperate rain forest, alpine moors, with glacial lakes
Daintree	Australia (Queensland)	Tropical rain forest, waterfalls, and diverse wildlife
Fiordland	New Zealand	New Zealand's largest park, has coastal fiords, rain forests, and Sutherland Falls
Great Barrier Reef	Australia (Queensland)	World's largest marine reserve; coral reefs and underwater species
Kakadu	Australia (Northern Territory)	Aboriginal cave paintings; includes tropical tidal flats, mangrove swamps, flood plains, woodlands, and sandstone escarpments
Mount Cook	New Zealand	High mountains, Tasman Glaciers, native wildlife
Tongariro	New Zealand	Active volcanoes; ancestral land of the Maori
Uluru-Kata Tjuta	Australia (Northern Territory)	Includes Ayers Rock and the Olgas, rock domes in the desert; ancient cave paintings
EUROPE		
Askaniya Nova	Ukraine	Steppe wilderness and wetlands; summer home for migrating ducks and geese; spawning site for fish
Bayerischer Wald	Germany	Bavarian forest
Białowieża	Poland	Lowland forests, hundreds of species of flowering plants, virgin woods, European bison
Doñana	Spain	Wetland reserve for migrating waterfowl
Gran Paradiso/Vanoise	Italy/France (Alps)	Alpine landscape; ibex, chamois

Name	Location	Outstanding features
Greenland	Greenland	Arctic wildlife habitat
Lake District	United Kingdom	Mountains, valleys, and glacial lakes, picturesque scenery
Padjelanta/Sarek/ Stora Sjofallet	Sweden	Meadows, glacial peaks, and rugged valleys; grazing herds of reindeer, other wildlife
St. Kilda	United Kingdom	National scenic area; breeding ground for puffins, gannets, other marine birds
Swiss	Switzerland	Coniferous forests, alpine meadows, slopes, and outcrops
Tatransky/Tatra	Czech Republic/Poland	Mountainous area with alpine plants and trees
Teberdinskiy	Russia (Caucasus)	Mountainous forests and meadows, glaciers and glacial lakes; home to ibex, deer, wild boars, pheasants, partridges, and grouse
NORTH AMERICA		
Banff/Jasper	Canada (Alberta)	Rocky Mountain scenery with glaciers and hot springs
Darien	Panama	Rain forest, mangrove swamps, white sand beaches
Denali	USA (Alaska)	Mount McKinley, highest mountain in North America; spectacular wildlife
Everglades	USA (Florida)	Subtropical wilderness with plentiful wildlife
Fundy	Canada (New Brunswick)	Rugged Bay of Fundy shoreline with coves and cliffs; world's highest tides
Glacier	USA (Montana)	Glaciers and lakes among towering Rocky Mountain peaks
Grand Canyon	USA (Arizona)	Deep canyon with brightly colored walls and rock shapes
Great Smoky Mountains	USA (North Carolina/ Tennessee)	High mountains; large hardwood and evergreen forests
Gros Morne	Canada (Newfoundland and Labrador)	Scenic Long Range Mountains; fiordlike lakes, waterfalls, and rugged seacoasts
Isle Royale	USA (Michigan)	Island wilderness with large moose herd and wolves
Ixtacihuatl-Popocatepetl	Mexico	Mountain peaks, climbing and hiking trails
La Amistad	Costa Rica/Panama	Virgin forest; great biological diversity; dormant volcano
Mammoth Cave	USA (Kentucky)	Huge cave with several hundred miles of corridors
Mesa Verde	USA (Colorado)	Ancient Indian cliff dwellings
Olympic	USA (Washington)	Mountain wilderness, wild coastline, and rain forest; elk
Pacific Rim	Canada (British Columbia)	Beaches, rocky shore, islands, and forests; sea lions, whales
Redwood	USA (California)	World's tallest known tree in coastal redwood forest
Sian Ka'an	Mexico	Tropical forest, mangrove swamps, white sand beaches
Tikal	Guatemala	Ruins of the ancient Mayan civilization
Tortuguero	Costa Rica	Nesting area for the Atlantic green turtle; lowland rain forest
Wood Buffalo	Canada (Alberta/Northwest Territories)	Largest buffalo herd in North America and nesting grounds of rare whooping cranes
Yellowstone	USA (Wyoming/Montana/Idaho)	World's greatest geyser area; canyons and waterfalls; wide variety of wildlife
Yosemite	USA (California)	Mountain scenery with deep gorges and high waterfalls; sequoia forests
SOUTH AMERICA		
Amazonia	Brazil	Variety of ecosystems; spider and howler monkeys, anteaters, capybaras, caimans, parrots, and toucans
Canaima	Venezuela	Angel Falls, the world's highest waterfall; grassland with flat-topped mountains, rain forests
Galapagos	Ecuador	Island ecosystems with unique wildlife
Iguaçu/Iguazú	Brazil/Argentina	Magnificent Iguaçu Falls; tropical rain forests; diverse bird and mammal species
Itatiaia	Brazil	Rugged area between Rio de Janeiro and São Paulo; diverse habitats ranging from rain forests to high plateaus with unique rock formations
Kaieteur	Guyana	Tropical rain forest, savannas; Kaieteur Falls; jaguars, ocelots, tapirs, and many species of birds
Los Glaciares	Argentina	Major glaciers from the southern Patagonian ice field
Manu	Peru	Undisturbed rain forest, with diverse plant and animal life; many species of birds and monkeys
Nahuel Huapi	Argentina	Mountains, glaciers, and glacial lakes and streams; hiking trails
Noel Kempff Mercado	Bolivia	Rain forest; jaguars, tapirs, monkeys, and the endangered giant otter
Pantanal	Brazil	Freshwater wetland near border with Bolivia; dense wildlife, including capybaras and hyacinth macaws
Raleighvallen-Voltzberg	Suriname	Rain forest along the Coppename River, Raleigh Falls; macaws and toucans, armadillos, sloths, and pumas
Rapa Nui	Chile (Easter Island)	Archaeological monuments and local cultural heritage
Torres del Paine	Chile	Dramatic peaks of southern Andes; Andean condors, eagles, rheas, and wild guanacos

Patrick Fagot, NHPA

Keith & Liz Laidler, Animals Animals

Wildlife preservation is a key goal of national parks throughout the world. Indonesia's Komodo National Park protects the endangered Komodo dragon, *above left,* and China's Wolong Natural Reserve shelters the rare giant panda, *above right.*

William Wordsworth long before it became a national park in the 1950's. Victoria Falls National Park in Zimbabwe and Mosi oa Tunya National Park in Zambia share protection of Africa's most famous waterfall. This landmark, the magnificent Victoria Falls, drops 355 feet (108 meters).

Many of the world's national parks are vital to wildlife preservation. Wolong Natural Reserve in China shelters rare giant pandas. Indonesia's Komodo National Park provides a habitat for the endangered Komodo dragon, a lizard that may grow over 10 feet (3 meters) long and weigh up to 300 pounds (135 kilograms). India's national parks, such as Ranthambhore, have probably saved the Indian tiger from extinction. The marshlands of Doñana National Park in Spain provide food and shelter to nearly half the bird species in Europe.

Challenges for the parks

People often think of the world's national parks as islands of unspoiled nature. We assume these parks are safely separated from a world rapidly becoming more urban, more industrial, and more artificial. The world's national parks, however, are part of the world in which we all live. What we do affects the parks and may threaten their existence.

Today, national parks face several major challenges. Major threats come from pressures to develop park resources, from environmental change, and from overcrowding. Park managers also struggle to guarantee the rights of the land's original inhabitants and to ensure sound management of fire and wildlife.

Development of park resources. Many national parks were set aside in the belief that they had little or no commercial value. Later, however, people discovered that many of the parks contain valuable resources. There are trees that might be cut, minerals that might be mined, grass that might be grazed, and land that might be farmed. There are also animals that might be captured or killed for sport or financial gain. The resources inside the parks will become increasingly valuable as resources outside the parks are exhausted. The commercial development of park resources often will produce more jobs and economic growth in the short term than will preservation of the parks.

Pressures to develop park resources generally cause only minor problems for governments of rich nations, where economic growth is strong. These governments have more ways to protect their national parks than do governments of developing nations. People of wealthy nations also do not need to use park resources for survival.

In developing nations, however, the situation is different. In such countries, especially in Africa and South America, governments may be forced to sacrifice parks in favor of economic development. Large corporations may acquire the right to use park resources by paying public officials for their cooperation. Many landless peasants seek park resources for survival. They may view the parks as the only lands available for collecting firewood, for building homes, for hunting food, or for raising crops.

Poachers also invade many parks. Many of these illegal hunters seek profits by killing animals for valuable body parts. For example, poachers slaughter leopards for their skin, elks for their antlers, elephants for their tusks, and rhinoceroses for their horns. Poachers also collect live animals for illegal sale, especially small birds that can be sold as pets. Some people also take rare plants from the parks. Where all or most of these pressures on park resources are severe, the parks may not survive.

Belinda Wright, DRK Photo

Poaching is a major problem in a number of national parks that provide homes for endangered wildlife. The leopard and tiger skins shown above were seized from poachers in India.

Changes in the environment also endanger the parks. Various forms of pollution—especially air and water pollution—present major threats because they easily cross park boundaries. For example, the scenic views of Grand Canyon National Park in the United States are often reduced due to air pollution from Los Angeles, which lies about 300 miles (480 kilometers) away. In addition, the park's environment has suffered from the construction of dams upstream on the Colorado River, which flows through the Grand Canyon. Changes in the flow of water have harmed water birds and other wildlife in the park.

Worldwide environmental problems also threaten national parks. These problems include an increase in the so-called *greenhouse effect* and the rapid reduction of tropical rain forests. The greenhouse effect is a warming at the earth's surface that results when the earth's atmosphere traps the sun's heat. The heat is trapped when it is absorbed by carbon dioxide and other gases in the atmosphere.

The amount of carbon dioxide in the atmosphere has grown because of the increased burning of such fuels as coal, gas, and oil. Rain forests absorb large amounts of carbon dioxide. But the forests can handle less and less carbon dioxide because developers and farmers

continue to cut down or burn the trees.

Some scientists are concerned about the effect of higher temperatures on the earth's surface. They warn that global warming may produce mass extinction of plants and animals and other harmful effects.

Overcrowding. The world's national parks have experienced dramatic growth in tourism during the 1900's. However, some popular parks are actually endangered by their admiring visitors, especially in the United States, Japan, and other wealthy nations with large populations. Too many visitors can harm the natural environments that national parks are set aside to protect. In some popular national parks, for example, visitors' automobiles create traffic jams, kill wildlife, and pollute the air. In addition, overcrowded campgrounds increase the level of litter and destroy the unspoiled beauty of scenic areas.

Overcrowding creates a difficult choice for park managers. Tourist spending demonstrates that park preservation has economic as well as spiritual value. In fact, income from tourists visiting the national parks in Africa is vital to the economies of many nations there. Nevertheless, managers have had to limit the number of cars and campers, and to establish other restrictions to protect park resources for future generations.

The rights of original inhabitants. The peoples who live in and near national parks are especially concerned about who benefits from tourism in the parks. In some countries, the benefits have gone to political officials who control the parks and to large foreign-based corporations. The original inhabitants may then see the parks as a foreign idea and one damaging to their lives. As a result, they may oppose the establishment and preservation of national parks.

Some park managers concerned for the rights of local peoples look to New Zealand and Australia for solutions. In those countries, the Maoris and the Aborigines support the creation of national parks as a way to preserve their sacred places and traditional ways of life. The cooperation of the Aboriginal groups and the Australian National Park and Wildlife Service at Kakadu National Park, for example, may serve as a model for other countries.

Management of fire and wildlife. Fire and wildlife often cause problems for park managers. Both fire and wild animals must behave naturally to preserve a park's ecosystem. If allowed to burn freely, fire destroys old and diseased trees and shrubs and helps nourish the soil. These conditions promote new growth. Allowing animals to hunt and roam freely helps parks maintain a balanced and varied wildlife community.

However, fire and wild animals may threaten neighboring crops, livestock, property, and people. Neither fire nor animals recognize park boundaries. As a result, park managers must find ways to prevent fire and wildlife from passing over park boundaries. Solving this problem is difficult because some solutions can lead to other problems. For example, park officials can use modern techniques to extinguish fires, and they can build fences to prevent animals from roaming outside the parks. But such actions can upset the delicate balance required for healthy wildlife populations and damage the ecosystem.

Park managers also must maintain an adequate amount of vegetation in the parks for plant-eating animals. Overgrazing can lead to starvation for such animals. This problem may result if a park lacks animals that prey on the plant-eating animals. Overgrazing has developed in Yellowstone National Park in the United States, partly because of an elk population unchallenged

The Grand Canyon of the Yellowstone cuts across Yellowstone National Park in the United States for about 20 miles (32 kilometers). The Yellowstone River flows through the canyon, creating two waterfalls. Yellowstone, the world's first national park, was established in 1872.

Tom Till, DRK Photo

by natural predators. Park managers have added wolves, a natural enemy of elk, to the park's wildlife.

History

Throughout history, people have preserved and protected places they considered special. But it was not until the 1800's that governments became active in establishing national parks.

The early national parks. The United States pioneered the development of national parks. Americans became interested in protecting the nation's wilderness as the country expanded westward during the 1800's. In 1832, the artist George Catlin became one of the first noted Americans to publicly call for the creation of a national park. In 1858, the writer Henry David Thoreau also promoted the idea. Both Catlin and Thoreau also saw national parks as places where American Indians could preserve their vanishing cultures. The dream of a great national park became a reality in 1872, when President Ulysses S. Grant signed a law creating Yellowstone National Park.

The national park idea spread to other countries. In 1885, the Canadian government established a park around the hot springs at Banff, Alberta. During the next 40 years, national parks opened in Australia, Germany, Italy, New Zealand, South Africa, Spain, Sweden, and Switzerland. Also during this period, Belgium and France established national parks in their colonial possessions in Africa.

International concern for national parks. The growth of national parks around the world led to the formation of international conservation organizations. In 1948, the International Union for the Protection of Nature was founded. In 1956, it was renamed the International Union for the Conservation of Nature and Natural Resources and became known as the IUCN. In 1960, the IUCN established the International Commission on National Parks. The commission became the Commission on National Parks and Protected Areas in 1975. This commission has taken the lead in organizing world conferences on national parks.

The United Nations Educational, Scientific and Cultural Organization (UNESCO) established two other important conservation programs. It founded the Man and the Biosphere Program in 1971 to preserve ecosystems throughout the world for scientific and educational purposes. In 1978, UNESCO released the first World Heritage List, which recognized areas of unique natural or cultural importance.

The national park movement today. By the 1990's, the idea of establishing national parks had proved popular and had spread to most of the world's countries. Planners put more emphasis on creating parks to preserve the full range of a nation's plants, animals, and landscapes. They stressed the value of establishing parks in areas of scientific and environmental importance even if those parks might not be particularly popular with tourists.

People also increasingly recognized that national parks are not natural islands that can be maintained separately from the world around them. Now we know that the survival of national parks depends on what we do both inside and outside the parks. Craig W. Allin

IV. History

Questions

What are some purposes of national parks?
Why does Australia's history make its parks especially important to scientists?
What is Canada's ecosystem approach to park planning?
Why are Japan's national parks rooted in both religion and recreation?
What is the Man and the Biosphere Program? The World Heritage List?
Which park was the world's first national park?
What problems does overcrowding cause in some popular parks?
Why may the peoples who live in or near national parks oppose the establishment of parks?
What have people increasingly recognized about national parks?
What worldwide environmental problems threaten national parks?

National Park Service is a bureau of the United States Department of the Interior. It manages the more than 380 areas of the National Park System. The bureau preserves many natural landscapes and historic and archaeological sites and structures. The bureau was established in 1916, when the U.S. park system consisted of 37 areas. These areas included Yellowstone National Park, the world's first national park. The U.S. secretary of the interior appoints a director to head the bureau in its Washington, D.C., headquarters. The bureau has 10 regional offices, a planning and service center, and two training centers. Critically reviewed by the National Park Service

Yosemite National Park, in east-central California, was one of the first national parks created in the United States. The park is known for its spectacular scenery, including Lake Yosemite, *shown here.* Yosemite Falls, *background,* North America's highest waterfall, drops 2,425 feet (739 meters) from its hanging valley.

National Park System

National Park System consists of hundreds of areas in the United States that have been set aside for the benefit and enjoyment of the people. These areas, called *parklands,* are natural wonderlands, famous historic places, or sites for many kinds of outdoor recreation. They include national parks, monuments, battlefields, lakeshores, rivers, and historic buildings.

The nation's parklands range in size from millions of acres (or hectares) to a fraction of an acre (or hectare). The largest parkland in the United States is Wrangell-St. Elias National Park in Alaska. This park, which features many glaciers and high peaks, covers more than 8 million acres (3 million hectares). The smallest area in the National Park System is the Thaddeus Kosciuszko National Memorial in Philadelphia, a red brick building that occupies $\frac{1}{50}$ of an acre (.008 hectare). The building was briefly the home of Kosciuszko, a Polish patriot who fought in the Revolutionary War in America (1775-1783).

The United States government established the first national park in the world, Yellowstone National Park, in 1872. The National Park System developed with the creation of additional parklands. Today, the District of Columbia and every state except Delaware have at least one national parkland. The outlying U.S. regions American Samoa, Guam, Puerto Rico, and the Virgin Islands also have national parklands.

The National Park Service, a bureau of the U.S. Department of the Interior, manages nearly all the parklands. The president of the United States appoints a director to head the National Park Service. The director names a superintendent to manage an individual area or a group of areas close together. Park rangers work to protect the parklands from damage and provide various services for visitors (see **National Park Service**). See also the articles on the various parklands listed in the tables with this article. For information on national parks throughout the world, see the ***World Book*** article **National park.**

Kinds of parklands

There are about 20 different types of areas in the National Park System, including national parks, national monuments, national memorials, and national historic sites. See the table of *Types of areas.*

The different types of areas in the National Park System are preserved for three basic reasons. Areas may have (1) beautiful or unusual natural features, (2) historical importance, or (3) attractive recreational features. Many areas are set aside for more than one reason.

Areas preserved for natural features. Most national parks are preserved chiefly for the outstanding beauty or scientific importance of their natural features. For example, Yellowstone National Park, which covers parts of Idaho, Montana, and Wyoming, is world famous for its natural wonders. They include hot geysers that erupt from the ground, thundering waterfalls that plunge into deep gorges, and sparkling lakes that lie high among snow-capped mountains. Death Valley National Park, partly in Nevada and partly in California, is preserved for

its strange and beautiful rock formations. It has the lowest land surface in the Western Hemisphere—282 feet (86 meters) below sea level.

Many national monuments are preserved for unusual features. Among these are Agate Fossil Beds National Monument in Nebraska, which has deposits of ancient animal fossils, and Craters of the Moon National Monument in Idaho, which features lava fields with volcanic caves, cinder cones, craters, and tunnels.

Areas preserved for historical importance include ancient ruins, such as the remains at Georgia's Ocmulgee National Monument of Indian mounds and towns, some dating from 8000 B.C. Others honor important people or events in the history of the United States. These areas include battlefields, forts, and other military sites, and historic bridges, buildings, dams, canals, and farms. The homes of many U.S. presidents and other noted Americans are among the national historic sites. The most famous historical area is probably the White House, in Washington, D.C.

The historical areas look much as they did when they became important. Staff members sometimes restore buildings and natural features, raise animals on the farms, and wear clothing styles from the past.

Areas preserved for recreational use. National recreation areas, national seashores, and national lakeshores provide land and water resources for outdoor activities. For example, 68 miles (109 kilometers) of white sand beaches and dunes line the Gulf of Mexico at Padre Island National Seashore in Texas. The area's fishing, horseback riding, sailing, and swimming attract visitors from all parts of the country.

In other areas of the National Park System, such features as roads, trails, and water reservoirs have been developed to provide recreational opportunities. For example, one of the world's largest artificially created lakes, 250-square-mile (650-square-kilometer) Lake Mead, is a popular playground for water sports. Formed by Hoover Dam, the lake is part of the Lake Mead National Recreation Area, which lies partly in Arizona and partly in Nevada.

The park system also has cultural areas that provide attractive settings for fine arts performances. One such area is the Wolf Trap Farm Park for the Performing Arts in northeastern Virginia, which presents concerts and other fine arts programs in its auditorium. Lawns around the auditorium provide seating space for thousands of additional people.

*Listed in the order that they appear in the following tables in this article.

Visiting the parklands

Hundreds of millions of people visit the parklands in the National Park System each year. Many parklands offer free admission. Some areas allow camping or have lodgings for overnight stays.

Planning a visit. Learning about a parkland beforehand will increase the enjoyment of a visit. It is helpful to know what natural or historical features to look for and why they are important. For an overnight stay, visitors should find out whether the area has lodgings or campgrounds that will be open. It is also useful to know about available services and recreational activities, traveling routes, and various fees.

The tables with this article show which parklands have overnight lodgings, permit camping, are closed part of the year, or are not yet open to the public. The National Park Service provides additional information through its Web site at www.nps.gov to help plan a park visit. Area superintendents will mail other information upon request. For their addresses, write to Public Inquiries, National Park Service, 1849 C Street NW, Washington, DC 20240.

Visitors should stop at a parkland's visitor center for pamphlets and maps that tell about the area's features and activities. At many parklands, staff members offer campfire talks, guided trips, and amphitheater programs.

Visitors' costs. About two-thirds of the parklands are free to the public. The others charge a daily entrance fee. People under the age of 16 and organized groups of high school age pay no entrance fee.

The Park Service sells Golden Eagle Passports, which may be used for a year at all parklands that charge an entrance fee. People 62 or older may obtain a free Golden Age Passport. People who are blind, have permanent disabilities, or qualify for disability benefits may obtain a free Golden Access Passport. These two passports offer the same privileges as the Golden Eagle Passport as well as a 50 percent discount on other fees.

Overnight lodgings vary in price, according to quality. They include cabins, cottages, lodges, motels, hotels, and trailer villages. These lodgings, available in dozens of areas, are operated privately under contract with the National Park Service. Visitors should make reservations early. The busiest periods, except in warm climates, are

from late May to mid-October, and weekends and holidays the rest of the year.

Camping is permitted in about 100 national parklands—in the wilderness or on campgrounds. A wilderness site may be a great distance from such conveniences as drinking water and food supplies. Wilderness campers must notify the superintendent or a park ranger of their plans. Back-country camping opportunities are available in more than 100 parks.

Inexperienced campers should camp on campgrounds. Some of these sites have few conveniences, and others have many, including play areas for children. Some campgrounds are designed for individuals or for families or other small groups. Other sites are intended for large, organized groups, such as school groups. Reservations can be made for group sites. Commercial reservation service is available for a few popular campgrounds. For camping tips, see the **Camping** article.

Visitors' responsibilities. Visitors share with park rangers the responsibility of protecting the parklands. Carelessness can start a forest fire that could destroy lives and valuable resources. Visitors are not allowed to remove or damage any natural feature—not even a flower. The National Park Service repeatedly warns the public not to feed, tease, or touch any animals of the parklands.

Preserving the parklands

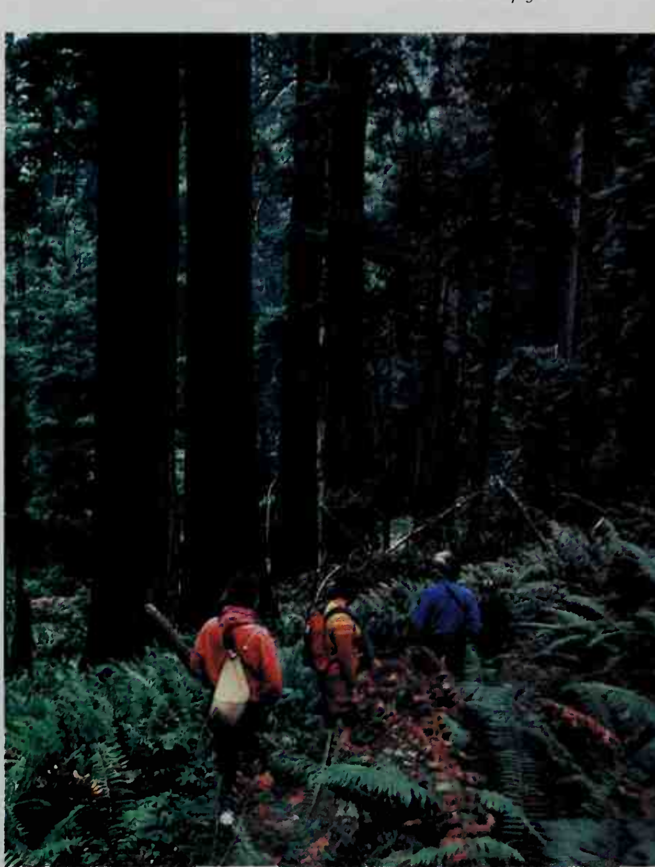
Limits on activities. To keep the parklands in an unspoiled condition, the National Park Service strives to disturb the plant and animal life as little as possible. The Park Service allows fishing, but hunting, lumbering, and mining are prohibited in most areas. Livestock grazing is limited and is steadily being eliminated. In most areas, water resources may not be used for such purposes as irrigation or the production of hydroelectric power.

The National Park Service encourages recreational activities in the parklands if they do not disturb the surroundings. The service tries to teach people about the natural processes that have made the land of each area what it is. Park rangers and other staff members are trained to explain natural and scientific features to visitors. The service also encourages research and educational activities in all the nation's parklands.

Fires are an essential process in many natural areas, including forests and prairies. For this reason, the Park Service permits fires started by lightning to burn in certain parks, as long as the flames do not threaten human lives, buildings, or rare resources. But the Park Service fights any fire started by people, such as careless campers or smokers.

Crowds. The ever-increasing number of visitors puts pressure on the national parklands. Problems include demands for such basic services as food, water, lodging, and transportation. Only through careful planning and management can these problems be handled without spoiling the parklands. Otherwise, overcrowding could result in too much automobile traffic, air pollution from automobile fumes and campfire smoke, dirty streams, and jammed campgrounds.

The National Park Service has taken many steps to correct early mistakes in parkland development. It has tightened controls on air and water pollution, food supplies, and health care. In Yosemite National Park, for example, public transportation was begun to reduce automobile traffic. The Park Service also cut the number of campers permitted in overcrowded Yosemite Valley.



Establishing new parklands

National parks can be created only through acts of the U.S. Congress. Congress must also approve nearly all other new areas for the National Park System. The president may establish a national monument if the government owns the land. The secretary of the interior may approve a national historic site.

Congressional committees usually hold hearings about adding particular lands to the park system. The secretary of the interior makes recommendations based on a study of an area's significance conducted by Park Service personnel.

The National Park Service acquires new land through donations, exchanges, purchases, or reassignment of federal properties. Many parklands in the system include some land that the government does not own. The government is gradually acquiring these sections. Dozens of areas are owned by state, local, or private agencies. The National Park Service may contribute funds or provide technical advice and assistance to the agencies that manage these areas.

Douglas Nelson, Latin Focus

Redwood National Park is a redwood forest with some of the world's tallest trees. Visitors enjoy hiking in the forest.

National parks*

Name	Area In acres	Area In hectares	Location	Outstanding features
Acadia†‡	47,498	19,222	Maine	Highest land on Atlantic Coast of United States; rugged coastline
American Samoa	9,000	3,642	American Samoa	Tropical rain forests with rare animal and plant life; white sand beaches and coral reefs
Arches†	76,519	30,966	Utah	Naturally formed rock arches, windows, and towers
Badlands†‡	242,756	98,240	South Dakota	Rugged ravines, ridges, and cliffs; prehistoric fossils
Big Bend†‡	801,163	324,219	Texas	Chisos Mountains and Desert in big bend of Rio Grande
Biscayne†	172,924	69,980	Florida	Living coral reef in Atlantic Ocean and Biscayne Bay
Black Canyon of the Gunnison†	29,927	12,111	Colorado	Steep-walled canyon with shadowed depths
Bryce Canyon†‡	35,835	14,502	Utah	Oddly shaped, beautifully colored rock formations
Canyonlands†	337,598	136,621	Utah	Canyons, mesas, and sandstone spires; 1,000-year-old Indian rock carvings
Capitol Reef†	241,904	97,895	Utah	Colorful ridge with white dome-shaped rock
Carlsbad Caverns	46,766	18,926	New Mexico	Huge underground caves with strange rock formations
Channel Islands†	249,561	100,994	California	Sea lion breeding place; nesting sea birds; animal fossils
Crater Lake†‡	183,224	74,148	Oregon	Lake in dead volcano; colorful lava walls almost 2,000 feet (610 meters) high
Cuyahoga Valley†‡	32,859	13,298	Ohio	About 20 miles (30 kilometers) of Cuyahoga River from Akron, Ohio, to Cleveland, Ohio
Death Valley†‡	3,340,410	1,351,816	California, Nevada	Great desert famous in Western history; lowest land surface in the Western Hemisphere
Denali†‡	4,740,912	1,918,579	Alaska	Mount McKinley, highest mountain in North America
Dry Tortugas†	64,701	26,184	Florida	Unusual bird and marine life; historic Fort Jefferson
Everglades†‡	1,508,356	610,410	Florida	Subtropical wilderness with plentiful wildlife
Gates of the Arctic	7,523,898	3,044,813	Alaska	Jagged peaks, arctic valleys, wild rivers, and many lakes
Glacier†‡	1,013,572	410,178	Montana	Glaciers and lakes among towering Rocky Mountain peaks
Glacier Bay†‡	3,224,840	1,305,046	Alaska	Glaciers that move down mountainsides and into the sea
Grand Canyon†‡	1,217,403	492,666	Arizona	Canyon 1 mile (1.6 kilometers) deep with brightly colored walls and rock shapes
Grand Teton†‡	309,995	125,450	Wyoming	Rugged Teton peaks; winter feeding ground for elk
Great Basin†	77,180	31,234	Nevada	Jagged peaks, bristlecone pines, and limestone caves
Great Smoky Mountains†‡	521,490	211,040	North Carolina, Tennessee	High mountains; large hardwood and evergreen forests
Guadalupe Mountains†	86,416	34,971	Texas	Fossil limestone reef; evergreen forest overlooking desert
Haleakala†‡	29,830	12,072	Hawaii	Inactive volcano with large, colorful crater
Hawaii Volcanoes†‡	209,695	84,861	Hawaii	Two active volcanoes; rare plants and animals
Hot Springs†	5,550	2,246	Arkansas	Mineral springs at base of Hot Springs Mountain
Isle Royale†‡§	571,790	231,395	Michigan	Island wilderness with large moose herd and wolves
Joshua Tree†	1,018,122	412,019	California	Joshua trees; desert plants and animals
Katmai†	3,674,530	1,487,030	Alaska	Valley of Ten Thousand Smokes, scene of 1912 volcanic eruption
Kenai Fjords	669,983	271,132	Alaska	The Harding Icefield, one of the major U.S. icecaps
Kings Canyon†‡	461,901	186,925	California	Mountain wilderness of giant sequoia trees
Kobuk Valley‡	1,750,737	708,498	Alaska	Rich in arctic wildlife, including caribou, bears, and wolves; archaeological sites
Lake Clark‡	2,619,733	1,060,168	Alaska	Jagged peaks, granite spires, glaciers, and two volcanoes
Lassen Volcanic†‡	106,372	43,047	California	Active volcano; steep domes of lava
Mammoth Cave†‡	52,830	21,380	Kentucky	Huge cave with 212 miles (341 kilometers) of corridors
Mesa Verde†‡	52,122	21,093	Colorado	Ancient Indian cliff dwellings
Mount Rainier†‡	235,625	95,354	Washington	Greatest single-peak glacier system in United States
North Cascades†	504,781	204,278	Washington	Mountain wilderness with glaciers, lakes, and waterfalls
Olympic†‡	922,651	373,384	Washington	Oceanside mountain wilderness with rain forest and elk
Petrified Forest	93,533	37,851	Arizona	Ancient, rock-hard wood; Indian ruins; Painted Desert
Redwood†‡	112,613	45,573	California	World's tallest living tree in coastal redwood forest
Rocky Mountain†	265,769	107,553	Colorado	More than 100 peaks over 11,000 feet (3,350 meters) high
Saguaro	91,445	37,007	Arizona	Cactus forest, including giant saguaro cactuses
Sequoia†‡	402,510	162,890	California	Giant sequoia trees; Mount Whitney
Shenandoah†‡	199,017	80,539	Virginia	Blue Ridge Mountains; hardwood forest; Skyline Drive
Theodore Roosevelt†	70,447	28,509	North Dakota	Badlands along Little Missouri River and part of President Theodore Roosevelt's ranch
Virgin Islands†‡	14,689	5,944	Virgin Islands	White beaches; tropical plants and animals

National monuments

Name	Area In acres	Area In hectares	Location	Outstanding features
Florissant Fossil Beds*	5,998	2,427	Colorado	Fossil insects, leaves, seeds, and tree stumps
Fort Frederica*	241	98	Georgia	Built between 1736 and 1748 to protect British colonists from Spaniards
Fort Matanzas*	300	121	Florida	Spanish fort built in the 1740's to protect St. Augustine from French
Fort McHenry*	43	18	Maryland	Defended against British in War of 1812; battle inspired Francis Scott Key to write "The Star-Spangled Banner"
Fort Pulaski*	5,623	2,276	Georgia	Captured by Union forces during Civil War
Fort Stanwix*	16	6	New York	Site of treaty with Iroquois Indians in 1768 and Revolutionary War siege in 1777
Fort Sumter*	200	81	South Carolina	Site of beginning of American Civil War
Fort Union*	721	292	New Mexico	Ruins of fort built in 1851 to protect travelers on Santa Fe Trail
Fossil Butte*	8,198	3,318	Wyoming	Fish fossils from 40 million to 65 million years old
George Washington Birthplace*	550	223	Virginia	Plantation where Washington was born; memorial mansion and gardens
George Washington Carver*	210	85	Missouri	Birthplace and boyhood home of famous African American scientist
Gila Cliff Dwellings*	533	216	New Mexico	Prehistoric dwellings in overhanging cliff
Governors Island	20	8	New York	Historic outpost protecting New York harbor
Grand Portage*	710	287	Minnesota	Fur-trading post on portage of canoe route to Northwest
Great Sand Dunes†	42,272	17,107	Colorado	Some of the largest and highest dunes in the United States
Hagerman Fossil Beds	4,351	1,761	Idaho	Fossil beds along banks of Snake River
Hohokam Pima*#	1,690	684	Arizona	Remains of settlement of Hohokam Indians, ancestors of the Pima Indians
Homestead	195	79	Nebraska	One of the first land claims under Homestead Act of 1862
Hovenweep†	785	318	Colorado, Utah	Prehistoric Indian cliff dwellings, pueblos, and towers
Jewel Cave*	1,274	515	South Dakota	Underground limestone chambers connected by narrow corridors
John Day Fossil Beds*	14,057	5,689	Oregon	Plant and animal fossils from five consecutive epochs in the earth's history
Lava Beds*†	46,560	18,842	California	Unusual caves, cinder cones, and other results of volcanic action
Little Bighorn Battlefield*	765	310	Montana	Site of Battle of Little Bighorn in 1876
Montezuma Castle*	858	347	Arizona	Indian dwellings in limestone cliff
Muir Woods*	554	224	California	Grove of coast redwood trees
Natural Bridges†	7,636	3,090	Utah	Three gigantic natural bridges of sandstone
Navajo†	360	146	Arizona	Ruins of prehistoric Indian cliff dwellings
Ocmulgee*	702	284	Georgia	Remains of Indian mounds and towns, some dating from 8000 B.C.
Oregon Caves‡	488	197	Oregon	Limestone caverns with rock formations
Organ Pipe Cactus†	330,689	133,825	Arizona	Organ-pipe cactuses and other desert plants found nowhere else in United States
Petroglyph	7,232	2,927	New Mexico	Ancient Indian and Hispanic rock carvings
Pinnacles†	16,265	6,582	California	Spirelike rock formations from 500 to 1,200 feet (150 to 366 meters) high; many caves
Pipe Spring*	40	16	Arizona	Fort and other structures built by Mormon pioneers
Pipestone	282	114	Minnesota	Quarry where Indians took stone for making peace pipes
Poverty Point	911	369	Louisiana	Earth dwellings dating back 3,000 years
Rainbow Bridge*	160	65	Utah	Largest known natural bridge—290 feet (88 meters) high and 275 feet (84 meters) across
Russell Cave	310	126	Alabama	Tools and other evidence of human life from 7000 B.C. to A.D. 1650
Salinas Pueblo Missions	1,071	434	New Mexico	Ruins of Spanish missions and Indian pueblos
Scotts Bluff	3,003	1,215	Nebraska	Landmark on Oregon Trail
Statue of Liberty*	58	24	New Jersey, New York	Including pedestal, the world's tallest statue; gift of France
Sunset Crater Volcano†	3,040	1,230	Arizona	Volcanic cinder cone and crater formed about A.D. 1100
Timpanogos Cave*§	250	101	Utah	Limestone caverns known for coloring and twig-shaped wall formations
Tonto	1,120	453	Arizona	Indian cliff dwellings dating from 1300's

See footnotes at end of table.

Tallgrass Prairie	10,894	4,409	Kansas	Tallgrass ecosystem in the Flint Hills
Timucuan Ecological and Historic	46,289	18,732	Florida	Timucuan Indian sites; coastal wetlands
Wrangell-St. Elias	4,852,753	1,963,839	Alaska	Adjacent to Wrangell-St. Elias National Park; large area of wilderness; much wildlife
Yukon-Charley Rivers	2,526,512	1,022,443	Alaska	Peregrine falcons; historic resources from gold rush era

†Camping permitted. ‡Has overnight lodging.

Continued from page 47

History

During the 1800's, hunters and trappers returned from the Yellowstone region with reports of strange natural wonders. These stories—of hot springs, spurting geysers, and a mountain of black glass—seemed unbelievable. In 1870, an expedition led by General Henry D. Washburn, surveyor general of the Montana Territory, visited the region to check the reports.

After exploring by horseback, the men camped near the Madison River. They talked about the sights they had seen and discussed developing the land for resorts, or for lumbering and mining. Then, Cornelius Hedges, a Montana judge, proposed that the region be preserved as a national park to benefit all people for all time. The other men agreed enthusiastically.

Members of the expedition promoted the national park idea by writing articles in newspapers and magazines, giving lectures, and meeting with high government officials. Their efforts succeeded in 1872, when Congress established Yellowstone National Park, the world's first national park. During the 1890's, four more national parks were established—General Grant (now Kings Canyon), Sequoia, and Yosemite in California, and Mount Rainier in Washington.

In 1906, Congress passed the Antiquities Act to stop looting and destruction at prehistoric Indian sites in the Southwest. This law gave the president the power to establish national monuments on land owned or controlled by the government. Later in 1906, Devils Tower National Monument in Wyoming became the first such area. More than 30 national monuments were established during the next 10 years.

In 1916, Congress set up the National Park Service as a bureau of the Department of the Interior. Stephen T. Mather, a Chicago businessman, became its first director. Mather did much to promote and expand the National Park System. In 1916, there were 16 national parks and 21 national monuments, with a total area of nearly 5 million acres (2 million hectares). When Mather retired in 1929, the system consisted of 25 national parks, 32 national monuments, and a national memorial. It had a total area of about 10 million acres (4 million hectares).

In 1933, Congress transferred more than 50 areas from other government agencies to the Department of the Interior. These areas, most of them historical, were added to the National Park System. In 1935, the Historic Sites Act gave the secretary of the interior the power to approve national historic sites.

The Park, Parkway, and Recreation Area Study Act of

1936 led to establishment of recreational areas in the National Park System. The first such area, the Blue Ridge Parkway, was established later that year. An act of 1946 allowed the Park Service to manage recreational areas under cooperative agreements with other government agencies that controlled the areas.

In the last half of the 1900's, much land was added to the National Park System. By the early 2000's, the system had grown to include over 380 areas and totaled more than 84 million acres (34 million hectares).

Questions

Where is the largest national park in the United States?
What efforts are made to preserve the plant and animal life in the parklands?
What was the first national monument?
Who was the first director of the National Park Service?
What is a Golden Eagle Passport?
How does the National Park Service acquire land?
What area became the first national park in the world in 1872?
What are the three basic reasons for including land in the National Park System?
What government agency must establish a new national park?
What national park has the smallest land surface in the Western Hemisphere?

National Primitive Baptist Convention in the U.S.A. is a religious organization that has more than 2,000 churches. Each church is independent in controlling its own membership. These Baptists follow three *ordinances* (established religious ceremonies)—baptism, Holy Communion, and foot washing rites. They believe that a definite number of the human race were chosen for redemption before the world was created, and these persons will be saved before the final judgment. The convention was formed in 1907. It consists of state conventions and associations. It operates a publishing house, women's auxiliaries, training unions, and church schools. The organization's headquarters are in Tallahassee, Florida. See also **Baptists.** Critically reviewed by the National Primitive Baptist Convention in the U.S.A.

National PTA. See National Congress of Parents and Teachers.

National Public Radio (NPR) is a public radio system in the United States. It acquires or produces news, cultural, and information programming and distributes it to more than 600 member stations in the United States, Puerto Rico, and Guam.

Member radio stations produce many of the cultural programs presented nationally by NPR. The cultural programming includes live performances of classical and jazz music. Reporters from member stations regularly file stories heard on NPR's newsmagazines.

The Corporation for Public Broadcasting, a private organization funded mainly by the federal government, created NPR to provide news programming and to link noncommercial radio stations across the United States. NPR was incorporated in 1970. Its first program transmission was live coverage of U.S. Senate hearings on the Vietnam War on April 19, 1971.

In 1977, NPR merged with the Association of Public Radio Stations and took on that organization's former responsibilities. For example, it began providing member stations with training and program promotion, and representing the interests of public radio before Congress and the Federal Communications Commission. In 1979, it established the first nationwide, satellite-delivered radio distribution network. NPR's headquarters are in Washington, D.C. Critically reviewed by National Public Radio

National Radio Astronomy Observatory (NRAO) is an organization that operates radio telescopes at Socorro, New Mexico; Kitt Peak, Arizona; and Green Bank, West Virginia. Scientists from the United States and other countries use these telescopes. The NRAO is financed by the U.S. National Science Foundation and has scientific offices in Charlottesville, Virginia.

The NRAO operates the world's most powerful radio telescope, the Very Large Array, near Socorro. This instrument consists of 27 large, dish-shaped metal mirrors called *reflectors* that collect radio signals from space. Each reflector measures 82 feet (25 meters) in diameter. The reflectors operate as a single instrument. Another NRAO instrument, the Very Long Baseline Array telescope, consists of 10 reflectors at sites across United States territory, from Hawaii to the Virgin Islands. They are controlled from Socorro by radio signals sent by a computer, and act as a single telescope.

The NRAO telescope at Kitt Peak has a 39-foot (12-meter) reflector designed to collect radio signals of extremely short wavelengths. At Green Bank, the NRAO operates the Robert C. Byrd Green Bank Telescope. The telescope's reflector has an unusual shape. Its rim is a flattened circle with a shortest diameter of 328 feet (100 meters) and a longest diameter of 361 feet (110 meters). Also at Green Bank, the NRAO operates a radio telescope that is 140 feet (43 meters) in diameter.

The NRAO was founded in 1956 by the National Science Foundation. Associated Universities, Inc., an association of nine U.S. universities, operates it. Scientists using NRAO telescopes have detected radio waves given off by nearly all types of objects in space. These objects range from nearby planets to distant quasars.

National Recovery Administration (NRA) was a United States government agency in the early 1930's. It was established in 1933 under the National Industrial

Recovery Act as part of the New Deal program (see New Deal). The NRA prepared and oversaw codes of fair competition for businesses and industries. Hugh S. Johnson was the first head of the NRA. President Franklin D. Roosevelt abolished the NRA in 1935, after the Supreme Court of the United States ruled the National Industrial Recovery Act unconstitutional. James T. Patterson

National recreation area. See National Park System.

National Republican Party was a political party that arose when the Democratic-Republican Party split during President John Quincy Adams's administration (1825-1829). The National Republican Party supported Adams's administration, and the split pitted the party against the followers of Andrew Jackson. During Jackson's presidency (1829-1837), the National Republicans and other groups formed the Whig Party (see Whig Party).

William W. Freehling

National Research Council is a private, nonprofit organization in the United States that carries out much of the work of the National Academy of Sciences, the National Academy of Engineering, and the Institute of Medicine. The council aids the academies and the institute in furthering the development of science and technology and in advising the U.S. government and other organizations. Thousands of scientists, scholars, and researchers serve as volunteers on its study committees.

The National Research Council was created by the National Academy of Sciences in 1916. It undertakes most of its activities at the request of the U.S. government. The council also initiates its own studies and carries out research at the request of private foundations and other organizations. It is financed by government and private funds. Its headquarters are in Washington, D.C.

See also National Academy of Sciences.

National Rifle Association of America is an organization that encourages sharpshooting and the use of firearms for hunting and other shooting sports. It opposes what it considers unnecessary restrictions on the right to own guns. Such restrictions include laws that impose cost or inconvenience on law-abiding gun owners. The association, also known as the NRA, supports laws that provide longer prison terms for people who commit crimes with firearms.

The NRA has based its opposition to gun control laws on the Second Amendment to the Constitution of the United States. This amendment reads: "A well-regulated militia, being necessary to the security of a free state, the right of the people to keep and bear arms shall not be infringed." However, in 1939, the Supreme Court of the United States ruled that the amendment does not prohibit most gun control laws.

Many people, including many law enforcement professionals, believe that stricter laws against owning and using guns would reduce the crime rate. The NRA feels that such laws would not help fight crime but would restrict the legal use of guns. The NRA has been effective at persuading Congress to block the passage of gun control bills. The NRA was founded in 1871. Its headquarters are in Fairfax, Virginia.

Franklin E. Zimring

See also Gun control; Second Amendment.

National Right to Life Committee is a leading organization in the movement against legalized abortion in the United States. Members try to influence Congress and the state legislatures to pass laws restricting access to abortion. The committee also attempts to defeat legislation that would extend abortion rights. In addition, the committee works to end *infanticide* (the killing of infants) and *euthanasia* (helping or allowing people to die).

The committee collects contributions from its members and gives the funds to political candidates it favors. The committee also conducts educational and outreach programs. These programs include National Teens for Life, a movement of young people opposed to abortion.

The committee was founded in 1973. That year, the Supreme Court of the United States made a landmark ruling in *Roe v. Wade* that states may not forbid abortions during the first three months of pregnancy. The committee has headquarters in Washington, D.C., and chapters in all 50 states. David M. O'Brien

National Road. In the early 1800's, many pioneers began moving into the territory west of the Ohio River. These settlers wanted their section to grow rapidly and began demanding a better route from the East to the West. In 1811, work began on a road that, when completed, led from Cumberland, Maryland, to Vandalia, Illinois. Over $7 million in federal funds was eventually spent on the road. It was known at first as the Great National Pike but later came to be called the National Road or the Cumberland Road. For many years, it was the chief road west. As railroads developed, the road became less important. See also United States, History of the (picture: The National Road). Robert C. Post

National Safety Council is a not-for-profit public service organization that works to increase safety and occupational health in the United States. The council has more than 35,000 members, including individuals, businesses, government agencies, schools, and civic, labor, and trade organizations. It promotes safe practices on and off the job and supports accident prevention laws and standards. The council produces films, pamphlets, and other materials on preventing accidents and illness.

The National Safety Council was founded in 1913 and chartered by the U.S. Congress in 1953. Its headquarters are in Chicago. Critically reviewed by the National Safety Council

National Science Foundation is an independent agency of the United States government. It promotes science and engineering research in the United States by (1) providing *fellowships* (monetary awards) to individuals for research and graduate study; (2) funding research institutions; and (3) supporting national research facilities, including the National Center for Atmospheric Research in Colorado and various supercomputing centers. The National Science Foundation (NSF) also funds and coordinates U.S. research in the Arctic and Antarctica, and it supports international research programs.

In addition, the NSF seeks to improve education in mathematics, science, and engineering. It supports programs that enhance the skills of teachers and improve *curriculums* (courses of study) at the elementary through high school levels.

Congress established the NSF in 1950. A director, deputy director, and a 24-member National Science Board head the foundation. They are appointed by the president, subject to Senate approval. The agency's

headquarters are in Arlington, Virginia.

Critically reviewed by the National Science Foundation

National Security Agency/Central Security Service is an agency of the United States Department of Defense. It has two primary missions: (1) ensuring the security of U.S. information systems and (2) gathering secret information transmitted by other countries. The agency is responsible for providing centralized coordination, direction, and performance of U.S. government activities related to these missions. The National Security Agency was established in 1952. The Central Security Service was created in 1972. Critically reviewed by the National Security Agency/Central Security Service

National Security Council (NSC) is a part of the Executive Office of the President of the United States. The council serves as an interdepartmental cabinet on defense, foreign policy, and intelligence matters. Members include the president, the vice president, and the secretaries of state and defense.

The NSC advises the president on many security problems. It brings together the departments and agencies most concerned with foreign policy and military matters. The council supervises the Central Intelligence Agency (see **Central Intelligence Agency**). The president calls meetings of the NSC. If a crisis develops, the president may call the group into immediate session.

The NSC is assisted by a staff headed by the assistant to the president for national security affairs. The staff works with the member departments and agencies to prepare studies and policy papers for the council's action. Congress created the council in 1947.

In 1986, the NSC was criticized for exceeding its authority as an advisory agency. This criticism arose when it was revealed that the NSC staff carried out secret arms sales to Iran and provided the profits to U.S.-supported rebels in Nicaragua. Some legal experts argued that both activities violated federal government policies at the time. In 1987, President Ronald Reagan responded to the criticism by adding a special legal adviser to the staff of the NSC. Harvey Glickman

National Trails System is a network of pathways and historic routes throughout the United States preserved for public enjoyment and in commemoration of significant periods or events in U.S. history. The system includes national scenic trails, national historic trails, national recreation trails, and connecting or side trails that provide access to these paths. The trails wind through rural, wilderness, and even urban areas. Three federal agencies—the National Park Service, the Forest Service, and the Bureau of Land Management—administer and coordinate the system.

National scenic trails provide opportunities for the enjoyment of outdoor activities and of spectacular natural beauty. The Appalachian National Scenic Trail, for example, extends more than 2,140 miles (3,444 kilometers) from Maine to Georgia. The trail, open only to hikers, hugs the crests of the Appalachian Mountains.

National historic trails mark significant periods or events in U.S. history. For example, the Oregon National Historic Trail preserves the 2,000-mile (3,200-kilometer) trail that was the pioneers' chief route to the Northwest during the westward expansion of the 1840's and 1850's.

National recreation trails are shorter trails that can be used for a wide variety of outdoor recreational activities, including bicycling, cross-country skiing, hiking, horseback riding, and snowmobiling.

The U.S. Congress established the National Trails System in 1968. The system originally included scenic trails, recreation trails, and connecting or side trails. Congress added the category of national historic trails in 1978.

National Weather Service. See Weather Service, National.

National Wildlife Federation is an organization founded to create interest and promote public education in the conservation of wildlife and wildlife habitats in the United States. The federation issues several free or inexpensive publications. It also publishes several magazines, including *National Wildlife* and *International Wildlife* for its adult members; *Ranger Rick* for younger members; and *Your Big Backyard* for preschoolers.

State wildlife federations and conservation leagues, made up of local clubs, are affiliated with the national organization. The federation has about 6 million members, counting members of affiliated organizations. The national group is financed by membership fees and the sale of nature-related items. The federation began in 1936. Critically reviewed by the National Wildlife Federation

National Wildlife Refuge System consists of over 450 refuges established by the United States government to protect and increase wildlife and their habitat. The refuge system covers over 90 million acres (35 million hectares). The smallest refuge is Mille Lacs National Wildlife Refuge, a $\frac{3}{5}$-acre (0.2-hectare) island in Minnesota. The largest refuge is Yukon Delta National Wildlife Refuge, which has almost 20 million acres (8 million hectares) in Alaska. The national refuges are managed by the U.S. Fish and Wildlife Service.

Each refuge has a specific purpose. Most were established to protect migratory birds. Some also protect species of wildlife in danger of becoming extinct. These species include bald eagles, brown pelicans, whooping cranes, sea turtles, and manatees. Refuges have played a major role in rebuilding the populations of buffaloes, elk, trumpeter swans, and pronghorns.

People also benefit from refuges. Refuges protect marshes, swamps, and other wetlands, which help con-

Water birds feed at St. Vincent National Wildlife Refuge near Apalachicola, Florida. The National Wildlife Refuge System has over 450 refuges that protect wildlife and their habitats.

trol flooding, filter pollutants, and refill the supply of underground water. Most refuges are open to the public, and many offer educational programs on protecting the environment. Hunting and fishing are permitted on some refuges, but these activities are strictly regulated.

The first wildlife refuge in the United States was established in 1903 on Pelican Island, off the east coast of Florida. President Theodore Roosevelt created this refuge to help protect brown pelicans and other birds that nest on the island. More refuges were set up through the years. In 1966, the U.S. Congress made these refuge areas the National Wildlife Refuge System.

National Zoological Park is a 163-acre (71-hectare) zoo maintained by the Smithsonian Institution along Rock Creek in Washington, D.C. The zoo exhibits about 5,000 animals of 500 different *species* (kinds). Wherever possible, animals, plants, and other living things are presented together in natural settings. Approximately 3 million people visit the zoo every year. National Zoological Park provides educational services to the public and conducts scientific research in animal behavior, ecology, zoo biology, animal reproduction, and exotic animal medicine. Conservation of endangered animal species is a major research focus.

Critically reviewed by the National Zoological Park

Nationalism is a people's sense of belonging together as a nation. It also includes such feelings as loyalty to the nation, pride in its culture and history, and—in many cases—a desire for national independence.

Since the late 1700's, nationalism has become an important force in international relations. Nationalistic feelings, particularly the desire of each country to govern itself, have helped change the map of Europe several times since the 1800's. Since the late 1940's, nationalism has also transformed the maps of Africa and Asia.

Although nationalism is widespread today, it once did not even exist. People have not always had a sense of nationhood. Early people felt they belonged to cities or tribes. In the Middle Ages, people were loyal to a number of groups and rulers. For example, a French citizen might have owed loyalty to the duke of Burgundy, the king of France, the Holy Roman emperor, and the pope.

The rise of nationalism occurred along with the development of a political unit called the *nation-state.* A *nation* is a group of people who share a common culture, history, or language and have a feeling of national unity. A *state* is an area of land whose people have an independent government. A nation-state exists if a nation and a state have the same boundaries.

Nation-states began to develop during the late Middle Ages. Travel and communication improved at that time. As a result, people became increasingly aware of the part of their country that lay outside their own community. Loyalty to local and religious leaders began to weaken, and allegiance to kings grew stronger. By the 1700's, England, France, Spain, and several other countries had become nation-states.

Other peoples developed a sense of nationhood by the early 1800's. But most had not become nation-states. Many people believed that a national group had the right to form its own state. This belief, known as the *doctrine of national self-determination,* caused many nationalistic revolutions in Europe. For example, Greece won independence from the Ottoman Empire in 1829, and Belgium became independent of the Netherlands in 1830.

Different forms of nationalism later developed in various parts of the world. In the United States, the spirit of nationalism expressed itself in rapid westward expansion during the 1800's. Many Americans became convinced that their nation had a *manifest destiny*—that is, a clear mission to take over all North America.

In Western Europe, new feelings of nationalism united the Italians and then the Germans, both of whom were still divided into many states. Each of these peoples combined to form one country out of the states. The unification of Italy was completed in 1870, and Germany became a nation-state in 1871.

In Eastern Europe, on the other hand, national groups sought to create smaller states out of the huge Austro-Hungarian, Ottoman, and Russian empires. These demands for national self-determination helped cause World War I (1914-1918) and broke up the empires after the war (see **World War I** [The rise of nationalism]).

During the 1930's, two dictators—Adolf Hitler of Germany and Benito Mussolini of Italy—used nationalism in demanding extreme loyalty from their people. They promoted *integral nationalism,* the belief that a certain nationality was superior to all others. This idea also placed strict limits on who could claim that nationality. In support of integral nationalism, the Nazis killed millions of Jews and other people they considered inferior. Germany and Italy also set out to conquer the world. Their actions helped bring on World War II (1939-1945).

After World War II, nationalism led many African and Asian colonies to demand self-government. India and Pakistan won independence from the United Kingdom in 1947. In 1948, a nationalistic movement called *Zionism* resulted in the establishment of Israel (see **Zionism**).

By the 1970's, more than 80 other nations had become newly independent. Many of them lacked the long history of shared experiences that had produced nationalism in Europe. But their leaders encouraged nationalism to help develop national unity. In the early 1990's, nationalism again contributed to the breakup of a number of states in Eastern Europe. These states included the Soviet Union, Yugoslavia, and Czechoslovakia.

Effects of nationalism can be both good and bad. Nationalism gives people a sense of belonging and pride and a willingness to make sacrifices for their country. They also take a greater interest in their nation's achievements in such fields as literature and music.

But nationalism also produces rivalry and tension between nations. Desires for national glory and military conquest may lead to war. Extreme nationalism may result in racial hatred and in persecution of minority groups. Joseph S. Nye, Jr.

Nationalist China. See **Taiwan.**

Nationality, in law, is a person's status as a member of a certain country. Usually, a person's citizenship is the same as his or her nationality. But the terms do not mean exactly the same thing. For example, before the Philippine Islands became independent, their people were nationals of the United States. They owed alle-

giance to the United States but were not U.S. citizens.

Nationality is acquired at birth according to either of two principles. The first is the *jus sanguinis,* or *right of blood,* which gives to a child the nationality of one of the parents, usually the father. The second, called *jus soli,* or *right of the place of one's birth,* makes a person a national of the country in which he or she is born. Most countries use both principles. Every country has the right to determine who its nationals shall be.

In the Commonwealth of Nations, the difference between nationality and citizenship was once important. The Commonwealth is an association of mainly independent countries formerly under British rule. All people living in the Commonwealth were considered to be both British subjects and citizens of their own countries. Today, however, citizens of Commonwealth nations are not considered British subjects. A British subject also may be a citizen of a Commonwealth nation if the subject meets that nation's citizenship requirements.

Nationality groups. Nationality also refers to the fact that many people continue the habits, the customs, and even the language of their native land when they go to live elsewhere. Many groups of people in U.S. cities try to keep alive the customs and traditions of other countries. Some of these people were born outside the country. But in some cases, every member of the group was born in the United States. Robert J. Pranger

See also **Citizenship; Naturalization.**

Nationalization is the control and ownership of an industry on a national scale by the government of a country. Industries that are most commonly nationalized include airlines, electric and gas utilities, mines, postal services, railroads, and telephone companies.

In some countries, nationalization plays a vital role in a set of economic, political, and social beliefs called *socialism.* These countries nationalize certain industries to provide better products or services for their citizens. Socialists say that nationalization ensures democratic control of these industries. In the past, Britain and France nationalized many industries for these purposes. But in recent years, political changes have resulted in the sale of many of the British and French industries to private investors. The selling of nationalized industries to private investors is called *divestiture* or *privatization.*

Other countries, especially some developing nations, have nationalized certain industries to remove them from foreign ownership. In the 1960's and 1970's, for example, some countries in the Middle East and elsewhere began to take over oil companies that had been owned chiefly by Americans or Europeans. These countries gained higher profits for themselves by removing the oil industry from foreign ownership.

Forms of nationalization. There are several forms of nationalization, based on how the nationalized industry is managed. In the most common form, a *public corporation* is set up as an independent body by law. The government appoints a board of directors that manages the industry. In another form, a government department has control of the industry. Such action gives the government close control of the industry. In a third form, the government buys part of the stock in an ordinary corporation, and private investors own the rest.

Advantages and disadvantages. Nationalized industries have some advantages over private industries. A nationalized industry can provide vital products or services to the public that would not be profitable for private industry to provide. The government can encourage a nationalized industry to invest and expand during an economic *recession* (slowdown). Nationalized industries can also develop weak parts of the economy and help hold down prices during periods of inflation.

Supporters of nationalization say that—in certain industries—a nationalized corporation can provide more efficient service than private industries. Such industries include electric and gas utilities and telephone companies. Supporters also say that government is too weak unless it has some control over vital industries.

Nationalization has some disadvantages. Many nationalized industries do not make a profit. As a result, the government uses money from taxes to *subsidize* (help pay for) them. Critics of nationalization charge that a lack of competition causes nationalized industries to become inefficient. They say government subsidies keep unprofitable industries alive even though the industries are no longer useful. Opponents also fear that too much power is concentrated in a government if it controls vital industries. Dennis L. Thompson

Natsume Soseki, *NAHT soo MEH SOH seh KEE* (1867-1916), was Japan's first great modern novelist. Soseki was a member of the first generation of Japanese youth exposed to Western books and ideas. His writing reflects his response to the problems of living in the modern world. He wrote about doubt and faith; self assertion and self questioning; alienation from industrial, mechanized society; and personal identity.

Soseki wrote 10 novels and several short stories. His first works were satires of the Japanese society of his time. He gained immediate fame with his first novel, *I Am a Cat* (1905). This episodic story is narrated by a cat who sardonically observes his master and neighbors. *Little Master* (1906) also indicts modern society. The story is narrated by a country teacher whose old-fashioned virtues are of little use in his changing world. The best known of Soseki's later, and more somber, works is *Kokoro* (1914). The novel tells the story of a young man's relationships with an older man and his father, told partly through letters. His other novels include *The Three-Cornered World* (1906) and *Grass on the Wayside* (1915).

Soseki was born in Tokyo. His real name was Natsume Kinnosuke. He trained as a scholar of English literature, studying in England from 1900 to 1902. In 1907, he joined the staff of the *Asahi* newspaper, which published many of his novels in serial form.

Laurel Rasplica Rodd

Natural gas. See **Gas** (fuel).

Natural gas liquids are certain chemical compounds that can be obtained in liquid form from natural gas. These compounds rank among the world's most valuable energy resources. Natural gas liquids, also called *NGL,* are widely used as fuel, and in manufacturing petrochemicals and other products.

The chief NGL compounds, in order of increasing mo-

lecular weight, are ethane, propane, butane, pentane, hexane, and heptane. Chemical manufacturers use ethane in making *ethylene,* an important petrochemical. Butane and propane, and mixtures of the two, are classified as *LPG* (liquefied petroleum gas). LPG is used chiefly as a heating fuel in industry and homes. Pentane, hexane, and heptane are called *natural gasoline* or *condensate.* Refiners blend natural gasoline with other gasoline.

Natural gas liquids are classified as *light hydrocarbons.* Hydrocarbons, which occur in natural gas and petroleum, are a group of compounds that contain only the elements hydrogen and carbon. All hydrocarbons become liquid under certain combinations of temperature and pressure, depending on their molecular weight. Light hydrocarbons liquefy at lower temperatures and higher pressures than do heavy hydrocarbons.

There are two main methods of producing NGL, *condensation* and *absorption.* In condensation, natural gas is chilled until it becomes a liquid from which the NGL are extracted. In absorption, processors mix gas with an oil that absorbs light hydrocarbons. NGL are then distilled from the oil. Natural gas processing plants produce most NGL. The United States produces about 40 percent of all NGL. Martin B. Sherwin

Natural number. See **Number theory.**

Natural resources are those products and features of the earth that permit it to support life and satisfy people's needs. Minerals, land, and water are natural resources, as are such biological resources as flowers, trees, birds, wild animals, and fish. Mineral resources include oil, coal, metals, stone, and sand. Other natural resources are air, sunshine, and climate. Natural resources are used to make (1) food; (2) fuel; and (3) raw materials for the production of finished goods.

This article discusses natural resources in general. For information on the natural resources of specific areas, see the *Natural resources* section in each state and province article, and in various country articles.

Uses and importance. Biological resources are the most important natural resources. All the food we eat comes from plants or animals. Since early days, people have used wood from trees for fuel and shelter. Biological resources, in turn, are dependent on other natural resources. Most plants and animals could not live without air, sunshine, soil, and water.

Mineral resources are also extremely important to modern living. Mineral fuels—including coal, oil, and natural gas—provide heat, light, and power. Minerals serve as raw materials for making finished goods, such as cars, plastics, and refrigerators.

Natural resources contribute—but are not essential—to a nation's wealth. Such wealthy nations as Canada and the United States are rich in natural resources. But some well-to-do nations, such as Denmark and Japan, have few of them. Some poor, or *less developed,* countries have few natural resources, though some, like Peru and Congo (Kinshasa), have many.

Conservation and development. Because modern civilization—even life itself—depends on natural resources, many people have been concerned about whether there will always be enough.

Scientists and economists believe that people can never use up all the mineral raw materials like iron, aluminum, sand, and fertilizer. There are sufficient quantities in the land and the sea, and most of the materials can be reused. For example, scrap iron can be melted down and used again in steelmaking. But people may have to explore farther and dig deeper to get what they need. Or they may have to substitute one material for another that has become too scarce. For example, aluminum may be used in place of copper for many purposes. While copper is scarce, deposits of bauxite and clay contain more aluminum than people can ever use.

Mineral fuels are different and can all be used up. The earth contains enough mineral fuels to last only one or two centuries at current rates of use. When these supplies run out, people may depend more on solar energy to power autos and factories and on nuclear energy to heat homes. Even today, uranium and other nuclear fuels generate electric power. Such fuels will last for many centuries. Sunlight is already used to run the instruments in space satellites and may someday be widely used to provide energy. Scientists are now trying to generate power by combining the *nuclei* (cores) of hydrogen atoms. This process, called *nuclear fusion,* is a potentially limitless source of energy. See **Nuclear energy; Solar energy.**

Preserving the delicate balance of nature in biological resources appears to be the most difficult and important part of saving our natural resources. People have often upset this balance. For example, poor farming methods have ruined much farmland and left it barren. Each year, millions of tons of fertile topsoil that could produce good crops are washed away by rains. Chemicals sprayed on crops and washed off by rain sometimes end up in rivers and streams. Some of these chemicals kill the fish in the streams. Some entire species of birds and animals have been killed off by hunters.

Fumes from automobiles and trucks and smoke from factories poison the air. This *air pollution* in many cities kills trees and endangers human health. As more cars and factories are built, the problem tends to get worse. To correct these conditions, people have to reduce the amount of pollution produced by factories and automobiles. In the United States, the quality of both air and water has improved significantly since the 1970's because of government regulations. See **Air pollution.**

Even if natural resources are conserved and developed, Earth could not provide enough food if the population increases too much. With much effort, the amount of land under cultivation could be doubled, and farms in many developing countries could produce three or four times as much as they now do. Improved crop varieties can greatly increase yields. All this might increase the food supply 5 to 10 times what it now is. But eventually the growth of world population must slow if everyone is to have enough food. Henry J. Aaron

Natural selection is a process in nature by which the organisms best suited to their environment are the ones

most likely to leave offspring. This process has been called *survival of the fittest,* though a more accurate term would be *reproduction of the fittest.* The theory of natural selection was first explained in detail in the 1850's by the British naturalist Charles R. Darwin. He believed all plants and animals had *evolved*—that is, developed by changing over many generations—from a few common ancestors by means of natural selection. Plants and animals produce many offspring, but some of the young die before they can become parents. According to Darwin's theory, natural selection determines which members of a species die prematurely and which ones survive and reproduce.

The theory of natural selection is based on the great variation among even closely related individuals. In most cases, no two members of a species are exactly alike. Each has a unique combination of such traits as size, color, and ability to withstand cold or other harsh conditions. Most of these traits are inherited.

Only a limited supply of food, water, and other necessities of life exists for all the organisms that are produced. Therefore, the organisms must constantly compete for these necessities. They also struggle against such dangers as being destroyed by animals that prey on them or by unfavorable weather. In any environment, some members of a species have combinations of traits that help them in the struggle for life. Other members have traits that are less suitable for that environment. The organisms with the favorable traits are most likely to survive, reproduce, and pass on those traits to their young. Organisms that are less able to compete are likely to die prematurely or to produce few or inferior offspring. As a result, the favorable traits replace the unfavorable ones in the species.

If the environment changes, different traits or combinations of traits may become favorable to survival, and the overall character of a species might change. In this way, a species adapts to its environment and avoids extinction. If two populations of a species live in different environments, they will probably develop differently. Eventually, they may differ so much that they become two separate species.

In 1858, Darwin and another British naturalist, Alfred R. Wallace, presented similar theories of natural selection. Many biologists rejected the idea at first. They incorrectly thought that natural selection and evolution would eventually stop because a species would have used up all its possible variations. Since then, scientists have learned that the cells of every living thing have tiny structures called *genes,* which determine the organism's hereditary traits. An organism inherits a set of genes from each parent. Variations occur in part because genes for new traits are constantly being introduced into a species and shuffled among individuals by reproduction. See **Gene; Heredity** (Heredity and natural selection).

Virtually all biologists believe that natural selection is an important process in evolution. But some religious groups reject the theory because it conflicts with their beliefs about the creation of life. Jerry A. Coyne

Naturalism, in literature, is the attempt to apply scientific theory and methods to imaginative writing. Naturalists concentrate on the physical world to the exclusion of the supernatural. Naturalism thrived in the late 1800's and early 1900's and has been most important in the novel and in drama.

Theory of naturalism. Naturalists have been the most uncompromising realists. They believe that knowledge is acquired through the senses, and that the function of the writer is to report accurately what he or she observes. The naturalist tries to be as objective as a laboratory scientist. In their theory of life, naturalists are more pessimistic than realists. The realist believes people can make moral choices, but the naturalist doubts that they can. Naturalists believe everything people do is determined by their heredity, or environment, or both. Naturalists believe people are trapped by forces such as money, sex, or power.

In picturing people as trapped, the naturalist usually deals with the more sordid aspects of life. Characters in naturalistic literature are driven by their most basic urges. They are often brutal and usually failures. They use coarse language, and their view of life is often bleak and without hope. Yet in the best naturalistic works, there is a tone of compassion and even admiration for those characters who struggle against overwhelming odds.

Naturalism in fiction. The principles of naturalistic fiction were first stated by the French author Émile Zola in *The Experimental Novel* (1880). Zola argued that novelists should treat their material as scientists treat theirs. Before 1880, psychological and physiological studies such as Zola recommended had appeared in works by Honoré de Balzac, Jules and Edmond de Goncourt, Gustave Flaubert, and other French writers. Zola's books shocked English and American readers, but his theories and novels established naturalism as an important literary movement.

Naturalism never became popular in England, but it has been a major influence in the United States since the 1890's. Stephen Crane, Hamlin Garland, and Frank Norris were the first Americans consciously to adopt the naturalistic style. Jack London and Edith Wharton developed it further. Most critics, however, consider Theodore Dreiser the best American naturalist. Dreiser's novel *An American Tragedy* (1925) is a moving account of a young man trapped by circumstance. Later American naturalistic novelists include Nelson Algren, John Dos Passos, James T. Farrell, Norman Mailer, and Richard Wright.

Naturalism in drama has the same goals as naturalism in fiction. A highly realistic setting provides a sense of environment overwhelming the characters. The staging, acting, and plots try to resemble life, not art. Everything focuses upon the hopeless, but often admirable, struggle of the characters against fate.

Zola also led the movement in drama with his adaptation of his novel *Thérèse Raquin* into a play in 1873. August Strindberg of Sweden and Gerhart Hauptmann of Germany rank among the best European naturalistic playwrights. Strindberg's *The Father* (1887) and *Miss Julie* (1889) are two violent studies of sex. *The Weavers* (1893) by Hauptmann, a grim portrait of a workers' revolt, set the style for German naturalism. Naturalism also appears in plays by Henrik Ibsen of Norway and Leo Tolstoy and Maxim Gorki of Russia.

In the United States, naturalism became most popular and important in the plays of Eugene O'Neill. Many of O'Neill's plays, especially the trilogy *Mourning Becomes Electra* (1931), have pathetic characters and depressing atmosphere. Other American playwrights whose works contain naturalistic elements include Arthur Miller, Clifford Odets, and David Mamet.

Naturalism today has declined in influence, but its methods and its view of life are responsible for much of the imaginative power in today's fiction and drama. Excessive though naturalism may have been in its hopelessness and brutality, modern literature reveals life more honestly because of it. Lawrence Lipking

Naturalization is a legal process by which a person becomes a citizen of an adopted country. Some nations, including Canada and France, give naturalized citizens the rights and duties of citizens by birth. Naturalized citizens of the United States cannot become president or vice president, but they have all the other rights and duties of people born as U.S. citizens.

A nation's naturalized citizens have the right to the protection of their adopted government when they travel abroad. However, some nations do not grant the right to give up citizenship. Such a nation could claim as a citizen any person who returned after being naturalized by another country. The adopted government might not be able to protect the individual in this situation.

Naturalization laws differ from nation to nation. For example, foreigners cannot be naturalized in the United States or Canada unless they have lived in their new country for a certain number of years. Israel, however, allows Jews from another country to be naturalized on the day they arrive. Many nations naturalize only people who understand the rights and obligations of citizenship and can use the national language. In many countries, foreigners who meet the requirements for citizenship take part in a naturalization ceremony. This ceremony includes an oath of loyalty to the adopted nation. In the United States and other countries, the oath of loyalty includes giving up citizenship in any other nation.

A special act by a government may naturalize groups of people without requiring them to follow the usual naturalization procedure. For example, an act by the U.S. Congress naturalized the people of Puerto Rico in 1917. The United States had gained Puerto Rico following the Spanish-American War (1898). Treaties also may include naturalization provisions.

Naturalization in the United States

The Immigration and Naturalization Service administers naturalization in the United States. The present naturalization law took effect in 1952. Until then, a person had to submit a declaration of intention to become a naturalized U.S. citizen. This declaration, sometimes called *first papers,* was required at least two years before the next step could take place.

The naturalization process consists of three steps: (1) an application, (2) an examination, and (3) the final hearing. Some states still require foreigners who plan to practice certain professions, including medicine and law, to submit first papers. However, these declarations are not part of the naturalization process.

An application must be submitted to an office of the Immigration and Naturalization Service. Applicants also must submit a fingerprint card and a biographical information form. The necessary forms and other materials may be obtained from offices of the Immigration and Naturalization Service, from naturalization courts, and from many social service agencies.

An examination of the applicant's qualifications for citizenship takes place after the application has been processed. Immediately before the examination, the applicant prepares and submits a *petition for naturalization.* The applicant, accompanied by two U.S. citizens who serve as witnesses, then appears before an officer of the Immigration and Naturalization Service. The witnesses testify to help the officer determine whether the applicant qualifies for citizenship.

Applicants must prove their qualifications in three areas: (1) age and residence, (2) character and loyalty, and (3) education.

Age and residence. Applicants must be at least 18 years old. They must have legally lived in the United States as permanent residents for at least the previous five years. Husbands and wives of U.S. citizens may qualify after a three-year residence. Short trips abroad, as well as longer trips for certain purposes, may be taken during the required period of residence. All applicants must have lived in the state where they seek naturalization for at least the previous three months.

Character and loyalty. Applicants must prove that they have lived by generally accepted moral standards throughout the last five years. They must follow these standards until naturalization has been granted.

The U.S. naturalization laws specify a number of practices that disqualify applicants on the basis of moral standards. These practices include habitual drunkenness or gambling, lying to gain benefits under immigration or naturalization laws, and crimes involving drugs or sex. No person who has ever been found guilty of murder can become a naturalized citizen of the United States.

Applicants must prove their loyalty to American principles of government. During the previous 10 years, they must not have willingly supported the Communist Party or any other organization considered disloyal.

Education. During the examination, applicants must read, write, and speak English unless a physical disability prevents them from doing so. Certain elderly persons are excused from this requirement. All people applying for U.S. citizenship must show that they have a basic knowledge of the history and the form of government of the United States.

The final hearing. After the examination, naturalization officers may request additional evidence of an ap-

plicant's qualifications. After the officers have completed their investigation, they prepare a report for the judge who will conduct the final hearing. The applicant learns before the final hearing whether the report recommends that the judge grant citizenship.

The final hearing is held at least 30 days after the petition for naturalization has been filed. The hearing takes place in a court authorized to grant citizenship. In most cases, a naturalization officer tells the judge whether the applicant has been recommended for naturalization, and the judge does not interview the person. An applicant who fails to win recommendation for citizenship may dispute the officer's findings, perhaps with help from a lawyer.

If the judge decides to grant citizenship, the applicant takes an oath of loyalty to the United States. The oath includes giving up any foreign citizenship and all loyalty to any other country. It also includes a promise to obey orders from the government to serve in the U.S. military forces. However, an applicant whose moral beliefs forbid bearing arms in war is excused from this promise.

After taking the loyalty oath, applicants receive certificates of naturalization and are considered citizens. In certain cases, children who are under the age of 18 automatically become citizens of the United States if at least one parent is naturalized. Parents may obtain citizenship certificates for such children. Applicants who are not granted citizenship in the final hearing may appeal to the next higher court.

Naturalization in Canada

Unlike the United States, Canada allows naturalized citizens to remain citizens of their native country. The registrar of Canadian citizenship, an official of the Department of the Secretary of State, issues certificates of citizenship. About 130,000 persons are naturalized in Canada yearly.

There are three steps in Canada's naturalization process. These steps are: (1) an application, (2) a hearing, and (3) a citizenship ceremony.

The application is submitted to a citizenship court. Application forms can be obtained from citizenship courts, superior county courts, and provincial courts, and from the registrar of Canadian citizenship.

The hearing takes place before a citizenship examiner. Applicants must prove that they qualify for citizenship. They must be at least 18 years old and must have legally lived in Canada as permanent residents for three of the previous four years. Applicants must show that they can use French or English well enough to be understood in their community. They also must demonstrate a basic knowledge of the history, government, and geography of Canada.

If the examiner approves the application, the person takes an oath of citizenship at a special ceremony. The applicant swears to remain loyal to the monarch of Canada, who is the king or queen of England. In addition, the individual promises to obey the laws of Canada and fulfill the duties of Canadian citizenship. The applicant receives a certificate of citizenship at this ceremony.

History

Until the 1800's, few people became citizens by naturalization. In general, citizenship in a city or nation was acquired only by being born there or by being the descendant of a citizen. However, the ancient Romans naturalized many of the peoples whom they conquered. The British government provided for the naturalization of settlers in the American Colonies through the Plantation Act of 1740.

During the late 1700's and the 1800's, a number of nations began to grant citizenship by naturalization. Millions of people were leaving their native countries to settle in the New World. Many of them wanted the full rights of citizenship in their new land.

The spread of democracy, which emphasized equality among people, also encouraged nations to grant citizenship more freely. During the late 1800's, some nations began to allow naturalized American citizens to give up citizenship in the country of their birth. People who gave up their citizenship in these countries could return to visit their homelands without fear of being claimed as citizens.

Since 1900, increasing international travel has resulted in easier naturalization procedures. Many people have no connection with the country of their birth. Many others are the children of immigrants and have no link with their parents' former country. In 1948, the United Nations stated in its Universal Declaration of Human Rights that people have the right to change citizenship.

Moses Rischin

Nature Conservancy is an international conservation organization that saves rare plants and animals from extinction by protecting the places where they live. One of the many ways that the organization accomplishes this goal is to acquire land, which it purchases or receives as a gift.

With 1,200 preserves, the Nature Conservancy owns and manages the largest private system of nature sanctuaries in the world. Its Pine Butte Swamp Preserve in western Montana contains the site of the world's first discovery of baby dinosaurs in nests.

The Nature Conservancy was founded in 1951. Since then, it has protected more than 5 million acres (2 million hectares) of critical habitats in the United States. The Nature Conservancy has also helped preserve several million acres in Latin America, including tropical rain forests. The organization has more than 550,000 members. It publishes *The Nature Conservancy Magazine,* a journal issued six times a year. The organization's headquarters are in Arlington, Virginia.

Critically reviewed by The Nature Conservancy

Nature study means watching and learning about things in nature. Students of nature may go on hikes in the countryside to observe the birds or to look for wildflowers. In the city, nature lovers may visit gardens, museums, parks, and zoos to learn about the natural world. Many youth organizations have nature study programs. Such organizations may sponsor outings or carry out special projects for the protection of the natural environment.

Careful observation is necessary in nature study. Many *naturalists* (students of nature) keep detailed records of their observations in the form of notes, sketches, or photographs. Some students of nature collect such things as flowers, insects, leaves, rocks, or shells. Natu-

ralists have made many important contributions to our understanding of nature.

Nature worship is a religious practice that has been followed by various cultures throughout history. It is based on the belief that nature is a god or a group of gods that can grant people favors and protect them from evil. Some peoples have worshiped all of nature in the form of one god or goddess. Others worshiped specific natural forces, such as the sun or the winds. In most cases, a community has worshiped the parts of nature most important to the group's survival. For example, early American Indians in agricultural areas asked the rain god for rain to make their crops grow. See also **Animism; May Day; Pantheism.** Christopher McIntosh

Nauru

Road
Railroad
Settlement
Elevation above sea level

WORLD BOOK maps

Nauru, *NAH roo,* is a small island country in the central Pacific Ocean. It is part of Micronesia, one of the three groups of the Pacific Islands. Nauru consists of a single island, which has an area of only 8 square miles (21 square kilometers). It is the third smallest country in the world. Only Vatican City and Monaco are smaller. Nauru is rich in *phosphates*—valuable chemical compounds used in making fertilizers. Phosphate exports earn a large part of the Nauruan government's revenue.

Nauru has no capital city. The main government offices of the country are located on the southwestern part of the island. The Australian dollar is Nauru's basic unit of currency. For a picture of the flag of Nauru, see **Flag** (picture: Flags of Asia and the Pacific).

Government. Nauru is a republic and a member of the Commonwealth of Nations. An 18-member Parliament makes the country's laws. Parliament members are elected by the people to three-year terms. All Nauruans who are 20 years old or older may vote. The Parliament elects a president to a three-year term. The president selects a Cabinet. The president and the Cabinet carry out the executive functions of the government.

Land. Nauru, an oval-shaped coral island, lies about 40 miles (65 kilometers) south of the equator. Most of the island is a plateau, 200 feet (61 meters) high, which contains deposits of phosphates. Near the center of the plateau is a lagoon surrounded by a small area of fertile land. Another belt of fertile land lies along the coast.

Most of the people live along the 12-mile (19-kilometer) coastline. In the past, the people raised their own food. Now, they import most of their food and other products they need. Nauru has a tropical climate that is cooled by trade winds. Temperatures range from 76 °F (24 °C) to 93 °F (34 °C). About 80 inches (200 centimeters) of rain falls yearly.

People. About half of Nauru's population of 12,000 are Nauruans—people of mixed Polynesian, Micronesian, and Melanesian ancestry. They are Christians. Most of them speak both the Nauruan language and English. The rest of Nauru's people are from Kiribati, Tuvalu, China, and Australia. They come for limited periods of time to help mine the phosphates.

The government provides Nauruans with modern homes at low rents, and 2 government hospitals and 11 clinics give them free medical care. The law requires Nauruan children between the ages of 6 and 17 to attend school. Nauru has five nursery schools, an elementary school, a high school, a Roman Catholic mission school, and a teacher training college. The government pays the expenses of students who attend universities in other countries.

Economy. Phosphates are Nauru's only important resource and its only export. A government-owned shipping company in Nauru serves many regions in the Pacific Ocean. A government-owned airline provides service to many Pacific areas. Nauru's government encourages such local industries as fishing and canoe building. Products that are imported include automobiles, food, furniture, machinery, medicine, and shoes.

Nauru also imports water for its needs.

History. Captain John Fearn, an English explorer, was the first European to visit Nauru. He came in 1798. In 1888, Germany took over the island and administered it until 1914 when Australia took control. After World War I (1914-1918), Australia began to administer the island under a League of Nations mandate held also by Britain, Australia, and New Zealand.

Japan seized Nauru during World War II (1939-1945). In 1945, Australian forces retook the island. In 1947, the United Nations (UN) provided for Australian control of the island under a trusteeship held also by Britain, Australia, and New Zealand. In 1964, Nauru began to work for independence and control of the phosphate industry. Nauru became independent in 1968 after a UN-supervised *plebiscite* (popular vote). In 1970, the Nauruan government gained control of the phosphate industry. Since then, the government has used revenue from phosphate exports to build homes, schools, and hospitals. It has also saved and invested much of the revenue to help support the Nauruan people after all the phosphates have been mined. Michael R. Ogden

Nausea, *NAW shuh* or *NAW shee uh,* is a disagreeable sensation in the area of the stomach. It is often followed by vomiting. In nausea, the muscles of the stomach wall slow or stop their movement. In turn, digestion of the contents of the stomach slows or stops. This action can help prevent the body from absorbing a poisonous substance that has been swallowed. If vomiting takes place, most of the substance will be expelled.

Nausea also may result from many other causes, both mental and physical. Mental causes of nausea include unpleasant sights, disgusting odors, and severe anxiety. Physical causes include severe pain, obstruction or irritation of the digestive tract, excessive physical exercise, and unnatural stimulation of the *vestibular system,* the organs of balance of the inner ear. Nausea that results from disturbances of the vestibular system is called *motion sickness* (see **Motion sickness**). Nausea often accompanies pregnancy, especially in the mornings of the first three months.

Some poisonous substances cause nausea by stimulating nerve endings in the lining of the stomach or intestine. Other poisons cause nausea after being absorbed into the blood. The blood carries the poison to special cells in the *medulla,* the lower part of the brain stem. These cells create nausea by sending impulses to higher parts of the brain, where sensations are received. Various drugs, including chlorpromazine and Dramamine, are used to control certain types of nausea (see **Chlorpromazine; Dramamine**). K. E. Money

Nautical mile. See **Knot; Mile**.

Nautical terms. See **Ship**.

Nautilus. See **Submarine** (Early submarines; Nuclear submarines); **Connecticut** (picture: The *Nautilus*).

Nautilus, *NAW tuh luhs,* is a marine animal whose soft body is partly covered with a coiled shell. The nautilus belongs to the same class of animals as the squid and octopus. A nautilus shell contains about 30 chambers which are lined with a rainbow-colored substance called *mother-of-pearl* or *nacre.* Because of this substance, the animal is often called a *pearly nautilus.* The nautilus lives at depths of 20 to 1,000 feet (6 to 300 meters) in the South Pacific and Indian oceans. It eats crabs and other crustaceans. About six species of nautilus are living today. At least 2,000 fossil forms are known.

W. E. Townsend, Jr., Photo Researchers

The chambered nautilus has a spiral shell. The animal adds a new, larger chamber to its shell each time it outgrows its old one. Its cone-shaped head is surrounded by short tentacles.

The body of a full-grown nautilus is about the size of a person's fist. Its cone-shaped head is surrounded by about 90 short *tentacles* (feelers). As the animal grows, its shell develops in the form of a spiral. The nautilus adds a new chamber to its shell each time it outgrows its old one. Each new chamber is closed at the rear, so the animal always lives in the outermost chamber of its shell. The closed chambers behind the animal are filled with nitrogen and other gases. The *siphuncle,* a coiled, blood-filled tube that is enclosed in a limy covering, extends through all the chambers of the shell.

Scientific classification. The nautilus is in the phylum Mollusca. It belongs to the nautilus family, Nautilidae. The pearly nautilus is *Nautilus pompilius.* Robert Robertson

Navajo Indians, *NAV uh hoh,* also spelled *Navaho,* are the second largest Indian tribe in the United States. Only the Cherokee tribe has more members. The Navajo reservation, which covers 16 million acres (6.5 million hectares), is the nation's biggest reservation. It includes parts of Arizona, New Mexico, and Utah. The growth of industry on the reservation promises to make the Navajo one of the wealthiest tribes in America. The Navajo call themselves *Diné* (pronounced *dihn EH*), meaning *the people.*

About 150,000 Navajo live on the Navajo reservation. Some of the people live in traditional tribal houses called *hogans,* which are made of earth and logs (see **Hogan**). Many Navajo practice the tribal religion. Large numbers of the tribe are farmers or sheep ranchers, but others are engineers, miners, teachers, or technicians. Skilled Navajo craftworkers weave wool blankets and make turquoise jewelry. The Navajo earn millions of dollars yearly, mainly from the mining of their vast coal deposits. The tribe also has a lumber mill and a manufacturing plant leased by an electronics firm. Navajo Community College, the first college owned and oper-

ated by Indians, is in Tsaile, Arizona, near Lukachukai, on the reservation.

About A.D. 1000, the ancestors of the Navajo migrated to the southwestern United States from what is now Alaska and Canada. Their Pueblo neighbors taught them to raise crops. During religious rituals, Navajo medicine men and medicine women created symbolic sand paintings to help heal the sick (see **Sand painting**).

During the 1600's, the Navajo began to raise sheep. An increasing number of white settlers established ranches on the Navajo lands, and the Indians fought to drive the ranchers away. In 1864, U.S. Army troops led by Kit Carson destroyed the farms and homes of the Navajo. The soldiers forced about 8,000 Indians to march more than 300 miles (480 kilometers) to Fort Sumner, New Mexico. The Navajo call this march the "Long Walk." Thousands of Indians died during the march and their imprisonment at the fort. In 1868, the Navajo agreed to settle on the reservation.

The Navajo reservation surrounds the Hopi Indian Reservation. The two tribes have disagreed over land ownership and use for many years, and the U.S. government has tried to solve some of these disputes. In 1974, Congress gave each tribe half of a 1,800,000-acre (730,000-hectare) land area in Arizona that the tribes had used jointly since 1962. However, many members of the Navajo tribe refused to move off the Hopi land. In the early 1990's, the Navajo and Hopi tribes reached an agreement, allowing Navajo families to remain on Hopi land for 75 years, living under Hopi law. Congress ratified this agreement in 1996. By the early 2000's, most Navajo families had either moved off Hopi land or had signed an agreement with the Hopi tribe. Delilah Orr

Naval Observatory, United States, is the country's oldest national observatory. It was founded in 1830 and is operated by the U.S. Navy. It includes a main station in Washington, D.C., and substations in Flagstaff, Arizona; Richmond, Florida, near Miami; and Black Birch, New Zealand. It also operates radio telescopes in Green Bank, West Virginia.

The United States Naval Observatory is responsible for measuring the positions and motions of the sun, moon, planets, and stars, and for monitoring the position of the earth. It also maintains the U.S. reference for precise time. The observatory distributes its data through such means as almanacs and related publications, electronic data links, and satellites. Information from the observatory is used by U.S. and international civilian and scientific agencies, primarily for navigation and scientific research.

The observatory's largest telescope, located in Flagstaff, is a reflecting telescope with a diameter of 61 inches (155 centimeters). In 1978, this instrument was used to discover Pluto's only known satellite, since named Charon. A 26-inch (66-centimeter) refracting telescope, now located in Washington, D.C., was used to discover the two moons of Mars in 1877.

Critically reviewed by the United States Naval Observatory

Naval War College, in Newport, Rhode Island, is the postgraduate educational institution of the United States Navy. The college improves the professional decision-making abilities of senior officers in both command and management positions in the United States Navy. It also conducts research aimed at developing strategies and tactics for use in future naval warfare.

The Naval War College consists of four resident colleges and the Center for Naval Warfare Studies. Two resident colleges train U.S. officers from all branches of the armed forces. The other two train officers from other countries. The Center for Naval Warfare Studies coordinates research and computerized war games. War games train officers to make decisions in battle by imitating actual combat conditions. Commodore Stephen B. Luce founded the Naval War College in 1884.

Navigation is the process of determining a vehicle's position and directing its movement. Navigation is used chiefly to guide airplanes, ships, and spacecraft, but it also can be used for vehicles that travel on land. The word *navigate* comes from two Latin words meaning *ship* and *to drive.* Navigation involves many sciences, including astronomy, mathematics, and physics, and a variety of equipment.

Basic navigation aids include a *chart* and a *compass.* A chart shows the physical characteristics of an area and is used to plot a vehicle's course and position. An aeronautical chart provides such information as the location of airports, the height of mountains, and the location of radio transmitters that aid navigation. A nautical chart provides the depth of the water, the location of buoys and lighthouses, and other sailing information. A navigator uses either a *magnetic compass* or a more complex electronic instrument called a *gyrocompass.* Gyrocompasses are more precise than magnetic compasses.

Vehicles also have such basic navigation aids as an extremely accurate timepiece called a *chronometer* and a device to determine speed. The speed gauge of a plane is known as an *air-speed indicator.* The one on a ship is a *log* and on a land vehicle is a *speedometer.*

There are five primary methods of navigation: (1) dead reckoning, (2) piloting, (3) celestial navigation, (4) electronic navigation, and (5) inertial guidance. A navigator uses one or more of these methods, depending on such factors as the type of vehicle and the weather.

Dead reckoning

Dead reckoning (DR) involves estimating a vehicle's position by considering how far and in what direction it has traveled. This method is not extremely accurate. However, navigators generally use dead reckoning along with any of the other methods.

In dead reckoning, the navigator determines the vehicle's position in relation to its last *fix.* A fix is a vehicle's known position. Starting at the fix, the navigator draws a line on a chart that represents the direction and distance traveled by the vehicle. The vehicle's DR position is at the end of this line. The navigator determines the direc-

tion with a compass. The distance is calculated by multiplying the vehicle's speed by the time traveled.

Dead reckoning does not consider such factors as current, steering errors, or the wind. Any of these factors may cause a vehicle to be at a location other than the calculated DR position. The navigator must then use a more accurate method to establish a new fix.

Dead reckoning helps the navigator keep track of a vehicle's position between fixes. It is also used to plot future positions and to estimate when the vehicle will arrive at its destination. Some large ships use a device called a *dead reckoning tracer* to plot their position electronically. The tracer monitors the ship's gyrocompass and log to ascertain the direction and distance traveled. This information is automatically and continually drawn on a chart or displayed on dials.

Piloting

In piloting, a navigator finds the position of a vehicle in relation to one or more landmarks. An up-to-date chart is a necessary aid. The chart shows the positions of natural landmarks, including mountains and islands, and of such artificial landmarks as buildings, buoys, and lighthouses. Piloting involves determining a landmark's *bearing* (direction) and distance from the vehicle.

A bearing is determined by using a compass or a *pelorus*. A pelorus is a compasslike device that measures the bearing of a landmark in relation to a ship. It has a circular face marked off in degrees and a *sight vane* that rotates above it. The navigator aims the sight vane at a landmark, and the bearing is shown on the face of the pelorus. A device called an *azimuth circle* can be attached to a compass and rotated like a sight vane to determine bearings. A hand compass can also be used.

The simplest method of piloting involves finding the bearings to two or more landmarks. A landmark's bearing is represented on a chart as a line called a *line of position*. The navigator determines the bearing of one landmark and draws a line of position from the landmark in the direction shown by the compass or pelorus. The vehicle's position is somewhere along this line. The navigator then ascertains the bearing of another landmark and draws a second line of position. The vehicle's location is the point where the two lines cross. Other methods of piloting include (1) observing the bearings of a single landmark at various intervals of time, and (2) observing when two landmarks lie on a single bearing.

Piloting can be used to navigate most types of vehicles. Ships use this method when entering or leaving ports, or when sailing close to land. Many small boats are piloted with only a chart and compass. Navigators may also use a *depth finder,* a device that measures the depth of the water. A navigator compares the depths indicated by this device with the depths on the chart.

Celestial navigation

Celestial navigation is a method of determining a vehicle's location by observing certain celestial bodies—the sun, the moon, the stars, and the planets. A publication called an *almanac* lists the positions of these bodies at all times during the year. Celestial navigation uses Greenwich Mean Time (GMT), the time in Greenwich, England (see **Time** [Worldwide time zones]).

There are many variations of celestial navigation. In

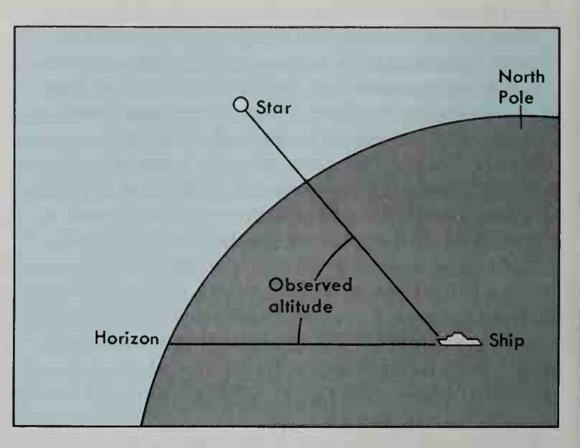
U.S. Navy

A navigator plots a vehicle's course and position on a chart that shows the physical characteristics of an area.

one common method, the navigator finds a vehicle's position in relation to an *assumed position* (AP). An AP is a point chosen by the navigator that is at or near the vehicle's dead reckoning position.

To determine the position of the vehicle, the navigator uses a *sextant*. This instrument measures the angular distance of a celestial body above the horizon. Such a measurement is called the *observed altitude* of the body. The navigator then calculates the *computed altitude,* which is what the body's altitude would be if the vehicle were at the AP. The navigator finds the computed altitude by solving a mathematical problem involving a *spherical triangle*. The points of the triangle are (1) the AP, (2) the North Pole or the South Pole, and (3) the *geographic position* (GP) of the celestial body. The GP is the point on the earth directly beneath the body. The navigator finds the GP of the celestial body in the almanac.

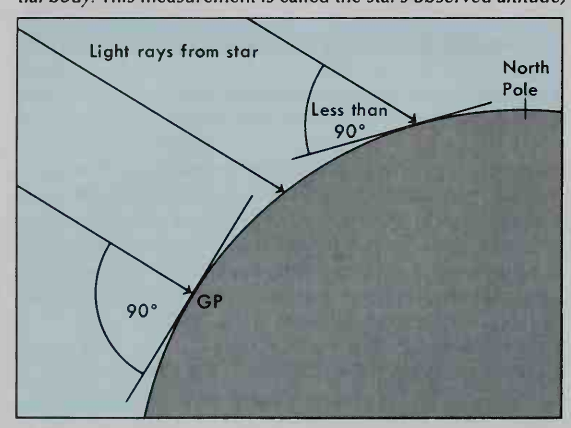
A special calculator or a navigation aid called a *sight reduction table* can be used to solve the triangle and determine the computed altitude. The navigator then performs certain calculations to compare the computed altitude with the observed altitude. A computer program may be used to determine the computed altitude and to perform the calculations. The calculations place the vehicle on a line of position. A fix is established by repeating the process with one or more celestial bodies.



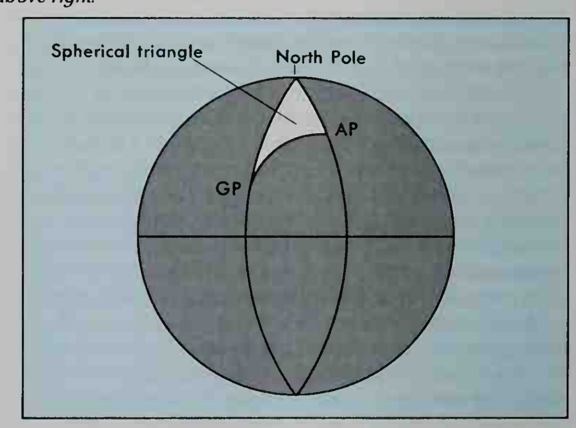
For most ships, celestial navigation can be used only when the sky is clear. Celestial navigation can be used on airplanes and spacecraft at any time these vehicles fly above the clouds. Submarines have a special navigation periscope that enables a navigator to view celestial bodies while the ship is underwater.

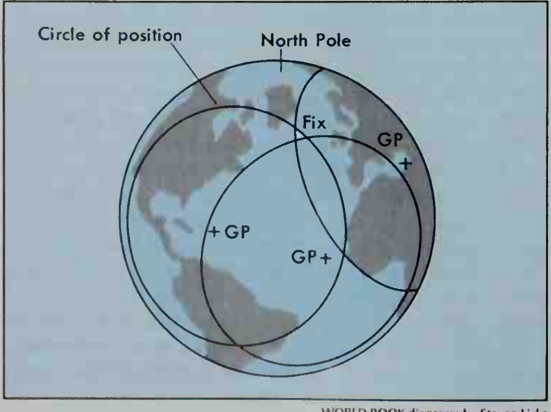
Electronic navigation

Various navigation systems are based on electronic devices, most of which use radio signals. Radio signals



A common method of celestial navigation





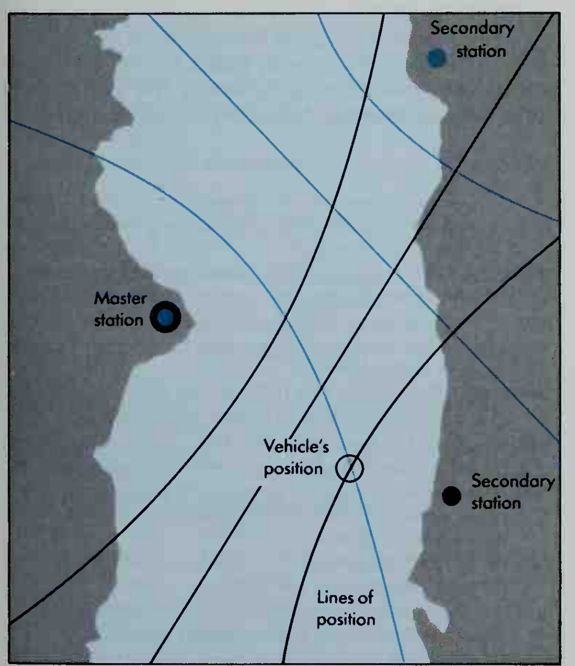
WORLD BOOK photo by Ralph Brunke

To find a vehicle's position, a navigator first chooses an *assumed position* (AP). An AP is a point that is at or near the vehicle's estimated location. The navigator then uses an instrument called a *sextant, above left,* to measure the angular distance between the horizon and a star or other *celestial body.* This measurement is called the star's *observed altitude, above right.*

Light rays from the star strike various points on the earth at different angles, *above left.* At the point directly beneath the star, the rays intersect the earth at an angle of 90°. This point is called the star's *geographic position* (GP). The GP, AP, and North Pole are the points of a *spherical triangle, above right,* which the navigator uses in calculating the star's *computed altitude.*

WORLD BOOK diagrams by Steven Liska

WORLD BOOK photo by Ralph Brunke



Determining the fix. The computed and observed altitudes are used to place the vehicle on a *circle of position.* The GP of the star is the center of the circle. Additional circles of position, involving observations of additional stars or other celestial bodies, are then established, *above left,* to determine the vehicle's location, or its *fix.* The navigator marks this position on a chart, *above right.*

vary in *frequency,* the rate at which a radio wave vibrates as it travels through air or space. High-frequency navigation signals generally can be used with great accuracy. However, high frequency signals cannot be transmitted beyond the horizon. Low-frequency signals usually are not as accurate in establishing position as are high-frequency signals, but they can be received thousands of miles away.

Common navigation systems that involve reception of radio waves include *loran, omega, omnirange,* and *radio direction finding.* In the United States, transmitters for these navigation systems are based on land, and most are operated by the government. Other systems that use radio signals include *radar* and *satellite navigation.* Radar equipment is carried aboard a vehicle or based on land. Satellite transmitters are based in space.

Loran is used to guide ships and some airplanes as they approach coastal waters from the sea. The word *loran* stands for *lo*ng *ra*nge *n*avigation. A loran system uses two types of stations called a *master station* and a *secondary station.* Special equipment aboard a ship or a plane uses the low- or medium-frequency signals sent by these stations to establish a *loran line of position.* The location of a vehicle is at the point where the lines of position derived from two pairs of loran stations intersect on a chart. In most cases, a single master station is paired with each of two secondary stations.

The type of loran system used in the United States and Canada is loran-C. A loran-C signal has a range of more than 1,000 miles (1,600 kilometers) during the day. Under certain atmospheric conditions, it can be received more than 3,000 miles (4,800 kilometers) away at night, when low-frequency radio waves travel farther. A

WORLD BOOK diagram by Steven Liska

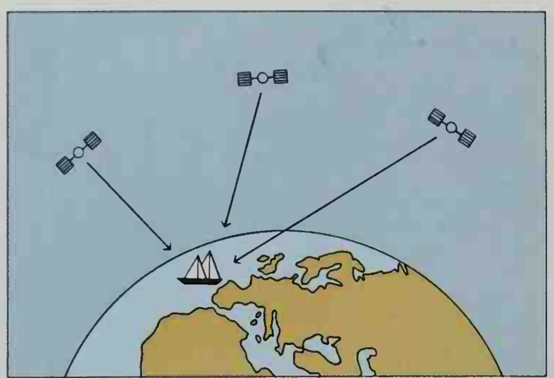
A position is fixed with loran, an electronic navigation system, by means of signals from a master station and at least two secondary stations. A vehicle's receiver uses these signals to establish lines of position and thus the vehicle's location.

Photri

Radar is an electronic navigation system that involves the transmission and reception of radio signals. Navigators at a United States Army radar control room, *above,* use radar to track the positions of missiles, ships, aircraft, and spacecraft.

position can be located within $\frac{1}{4}$ mile (0.4 kilometer). See **Loran.**

Omega is a worldwide navigation system for planes and ships. The system has eight transmitters located throughout the world and requires international cooperation to operate. Special equipment aboard a vehicle receives and processes the radio signals sent by two pairs of omega transmitters. This equipment establishes two lines of position for the vehicle. The vehicle's position is at or near the point where the lines of position cross.



Omnirange is a short-range navigation system for aircraft flying over land. A special receiver electronically traces the signal of an omnirange transmitter to determine the bearing of the transmitter from a plane. The location of the transmitter is shown on the aeronautical chart. Many omnirange stations also transmit signals for airborne *distance-measuring equipment,* which calculates a vehicle's distance from a transmitter.

Radio direction finding involves locating the bearing of a transmitter called a *radio beacon.* A radio beacon's signal is received aboard a vehicle by a device called a *radio direction finder* (RDF). The navigator turns the antenna of the radio direction finder to find the direction of the radio beacon. The RDF shows when the antenna is pointing toward the beacon.

Radio direction finding is one of the oldest electronic navigation systems for aircraft and ships. It is generally used as a piloting aid along coastal waters. The range of a radio direction finding signal depends on the type of radio beacon.

Radar is based on the transmission of radio signals toward an object and the reception of the signals that are reflected from the object. The return signals create an image on a radar screen, which shows the direction and distance of the object from the vehicle.

Radar has many uses in navigation. It helps a navigator carry out a piloting operation by locating the vehicle's position in relation to landmarks at night or in bad weather. Radar also is used to locate obstructions and to prevent collisions with other vehicles. In addition, navi-

WORLD BOOK illustration

The Global Positioning System includes satellites that circle the earth and broadcast their positions. A receiver can find its location by computing its distance from at least three satellites.

gators use radar to track the positions of airplanes, missiles, ships, and spaceships.

Satellite navigation. There are several satellite-based navigation systems. Probably the best known is the Global Positioning System (GPS), which became fully operational in 1995. The GPS includes 24 Navstar satellites, which are controlled by the U.S. Air Force. The word *Navstar* stands for *Nav*igation *S*atellite *T*racking *a*nd *R*anging. The satellites circle the earth in six different orbits. Each satellite broadcasts its exact position and the time. A computerized receiver on a vehicle analyzes how long it takes the broadcast from at least three different satellites to reach it. The receiver then determines its location by calculating its distance from these satellites. The GPS enables all types of vehicles on the earth and in the air to find their position under all weather conditions. Handheld GPS receivers may also be used outside a vehicle.

GLONASS, a satellite navigation system controlled by Russia, also provides global positioning information. It consists of a constellation of 24 satellites.

Inertial guidance

Inertial guidance involves the use of a computer and a device called an *inertial navigator.* An inertial navigator constantly monitors changes in the vehicle's motion and sends this information to the computer. The computer uses these changes, plus the distance and direction traveled, to calculate the vehicle's course and position. Inertial navigation is used to guide aircraft and submarines. Some guided missiles also use this method. See **Inertial guidance**.

History

In ancient times, sailors navigated by observing various celestial bodies and constellations and by studying the seasonal directions of the wind. During the Middle Ages (A.D. 400's-1500's), navigators drew simple charts that included wind directions for different seasons, plus compass directions.

Many of today's navigation instruments developed from crude equipment used hundreds of years ago. For example, the first compass consisted of a magnetized piece of metal on a straw. The straw floated in a container of water. The sextant developed from the *astrolabe* and the *octant,* two early instruments for measuring the angle between a celestial body and the horizon. An astrolabe consisted of a disk, plus a sight that turned on a pivot. An octant had the same arrangement of mirrors as a sextant.

In the 1700's, James Cook, a British navigator, became the first person to use modern celestial navigation methods. Cook used these techniques in several voyages to the Pacific Ocean.

The development of radio, followed by its use on ships and airplanes in the early 1900's, marked the start of electronic navigation. During World War II (1939-1945), German scientists developed navigation systems

Important dates in navigation

1100?-1200? Chinese and Mediterranean navigators used magnetic compasses to guide ships.

1519-1522 Ferdinand Magellan, a Portuguese navigator, led the first expedition to sail around the world.

1569 Gerardus Mercator, a Flemish geographer, invented the *Mercator map,* with which a navigator can determine direction and distance.

1730 John Hadley, an English mathematician, and Thomas Godfrey, an American astronomer and mathematician, independently invented the *sextant.* This device measures the angle between a celestial body and the horizon.

1735 John Harrison, an English clockmaker, made the first accurate *chronometer*—a device for measuring time.

1767 Nevil Maskelyne, an English astronomer, compiled the first *nautical almanac.* A nautical almanac is used to guide a ship by determining the positions of celestial bodies.

1802 Nathaniel Bowditch, an American mathematician and astronomer, wrote *The New American Practical Navigator.*

1842 Lieutenant Matthew F. Maury of the United States Navy charted the direction of winds and ocean currents. This information is used in *piloting,* a method of navigation.

1896 Guglielmo Marconi, an Italian inventor and electrical engineer, sent the first ship-to-shore radio signal.

1908 Herman Anschütz-Kämpfe, a German engineer, invented the gyroscopic compass.

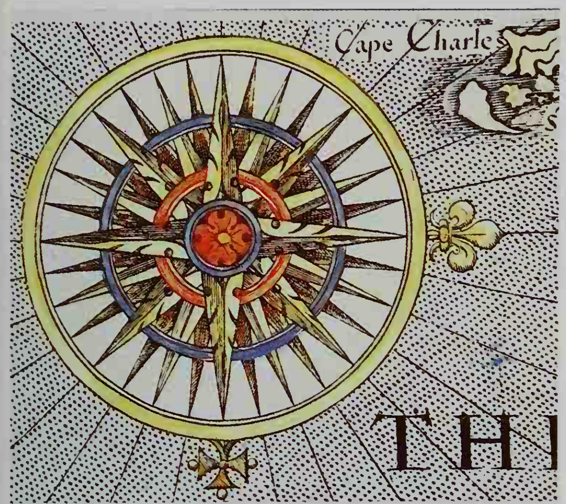
1910 J. A. D. McCurdy, a Canadian aviator, sent the first airplane-to-ground messages.

1933 P. V. H. Weems, an American navigator, compiled the first *air almanac,* used in guiding a plane by means of the positions of celestial bodies.

1939-1945 During World War II, British and American scientists made significant advances in radar technology.

1942 The United States built the first *loran* stations, which broadcast special radio signals used in navigation.

1945-1950 American scientists developed a highly accurate *inertial guidance system,* which guides a vehicle without using outside signals.



1964 The United States Navy's Navigation Satellite System (TRANSIT) began daily operation.

1978 The U.S. government launched the first satellite in what would become the Global Positioning System.

1982 The U.S. government's omega navigation system became fully operational with the completion of its last station.

1995 The U.S. Air Force announced that the Global Positioning System was fully operational.

1996 The U.S. Navy's TRANSIT system shut down.

Granger Collection

A compass rose, like this one on a 1612 map of Virginia, indicates direction. Lines radiate from it in 32 points of direction.

to guide V-1 and V-2 rockets. On the Allied side, British and American scientists made important advances in radar technology that aided navigation.

Satellite navigation began in 1960, when the United States Navy launched a satellite called TRANSIT *1B*. The TRANSIT satellite navigation system began daily operation in 1964. It consisted of seven operating satellites placed in widely spaced orbits, plus several spares. A computerized receiver could fix its position by analyzing the Doppler shift of the signals broadcast by any TRANSIT satellite as the satellite passed overhead (see **Doppler effect**). In the 1970's, the United States launched the first of several satellites of the Navstar Global Positioning System (GPS). The system became fully operational in 1995. The TRANSIT system was shut down in 1996.

Navigation Acts were several laws passed in the 1600's by the English Parliament. The purpose of the laws was to protect English trade. In 1645, Parliament passed a law that forbade the importation of whale oil into England in non-English vessels, or in ships that were not operated by English sailors.

The act known as the First Navigation Act was passed in 1651. It was aimed against the American Colonies and the Dutch, who were profiting from most of the overseas trade between the West Indies and Europe. The act provided that no products from any foreign country might be shipped into England in any but English-built ships operated by crews that were at least 75 percent English. But the act was not strictly enforced.

Parliament passed other trade laws in 1660, 1663, and 1672. The act of 1660 required that all the tobacco from the colonies must be brought to England. The act of 1663 (Second Navigation Act) declared that almost all goods imported into the colonies must be landed in England first. In 1672, an act was passed requiring that goods had to be shipped to England before they could pass from one of the American Colonies to another.

Before 1761, 29 acts limiting colonial trade had been passed. These included one law banning importation of molasses and sugar. America suffered little from these laws because of smuggling by the colonists. Several parts of the acts favored American industry, especially shipbuilding, because they encouraged American shipping. But the Americans vigorously opposed the restrictions on commerce. This opposition was one of the main causes of the Revolutionary War in America (1775-1783). The British Parliament, in 1849, *repealed* (canceled) all the Navigation Acts. Charles Carlton

Navratilova, *NAV ruh tuh LOH vuh,* **Martina** (1956-), became one of the world's top women tennis players. She has won a record 167 singles championships. She was noted for her strong serve, powerful backhand and forehand shots, and aggressive play.

Navratilova was born on Oct. 18, 1956, in Prague, in what is now the Czech Republic. She defected to the United States in 1975 and became a U.S. citizen in 1981. She won a record nine women's singles titles in the All-England (Wimbledon) Championships in 1978, 1979, 1982, 1983, 1984, 1985, 1986, 1987, and 1990. She won the Australian Open in 1981, 1983, and 1985, the French Open in 1982 and 1984, and the U.S. Open in 1983, 1984, 1986, and 1987. She also was a leading doubles player. In 2002, at the age of 45, she became the oldest woman to win a professional tennis championship when she won the Spanish Open doubles title with partner Natasha Zvereva of Belarus. The victory extended her career doubles victories to 166, a record. Arthur Ashe

Navstar Global Positioning System. See Global Positioning System.

A naval task force consists of a temporary unit of ships formed to carry out an operation. In this British task force, a V/STOL aircraft carrier leads a group of smaller Royal Navy warships.

Navy

Navy is the branch of a nation's armed forces that consists of warships and support ships, their crews, and land bases and their personnel. Many navies also have an air force. Some navies include combat forces called *marines,* who are trained to fight in the air and on land.

Most nations that have a coastline have a navy. But the world's navies differ greatly in size, in fighting strength, and in the types of ships and aircraft that they have.

Norman Polmar, the contributor of this article, is the author of the reference book The Ships and Aircraft of the U.S. Fleet *and the former editor of the U.S. sections of* Jane's Fighting Ships.

Smaller navies consist mainly of warships called *small combatants,* such as patrol boats, missile boats, and minesweepers. The main task of a small navy is to defend its nation's coastline. Larger navies also have major warships, such as aircraft carriers, submarines, and frigates. These warships can operate far out at sea without returning to port for weeks or months. Nations use large navies to control the sea and, during times of war, to attack enemy shores.

The United States and Russia have the world's largest navies. Other countries with large navies include Britain, China, France, and India. For centuries, the most powerful nations were often those with the strongest navies. The development of aircraft and missiles in the 1900's reduced the importance of seagoing forces. Nevertheless, navies still have tremendous military and political

value. Warships are flexible in operation, and they can travel the seas freely. International law allows ships to sail within 12 nautical miles (22.2 kilometers) of any country's coast without permission. Thus, a group of warships can serve as a temporary military base. More importantly, ships can carry out their mission independent of foreign land bases.

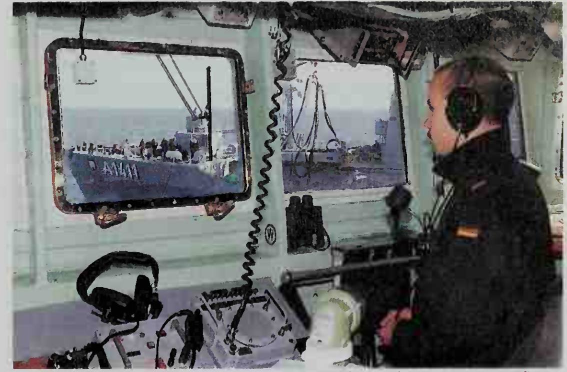
The role of navies

Nations use their navies in many different roles. A navy's role depends on its size and composition, and whether the nation is at war or at peace.

Peacetime roles. When a nation is at peace, it may show political support by sending its ships to an ally's port or by training with an ally's navy. Navies may also help deliver food, medicine, and other humanitarian aid to war-torn countries or to areas struck by a natural disaster. In addition, nations may use their navies to collect *intelligence* (information about potential enemies).

Sometimes, navies perform limited military operations during peacetime. For example, in the late 1980's, U.S. warships escorted oil tankers in the Persian Gulf to protect them from attack during the war between Iran and Iraq. This was a military action, even though the United States was not directly involved in the war.

Wartime roles. During a war, the primary role of a small navy is to defend its nation's coastline against enemies. Large navies have two principal wartime roles: (1) controlling the sea and (2) providing a base from which to launch attacks against the shore.



Controlling the sea means that a navy takes over specific areas of the ocean to ensure the safe passage of its own ships and to deny passage to enemy ships. Control of the sea involves defending ships against attack. It also may involve blockading enemy land bases so that enemy ships and aircraft cannot use them. A navy may control some areas of the sea by laying *naval mines* (explosive devices in the water). Naval mines can damage or destroy ships that try to pass over them.

A nation with a large navy also has the power to attack targets on land from the sea. Modern warships can launch attacks from positions far out at sea using missiles and aircraft. Navies may also launch *amphibious assaults*—invasions of enemy coastal areas by the combined action of land, sea, and air forces.

The organization of navies

Every navy has a shore-based branch and a seagoing branch. The shore-based branch includes headquarters, communications stations, airfields, shipyards, maintenance facilities, supply stations, naval schools, and their personnel. The seagoing branch, usually called the *fleet,* consists of a navy's ships, submarines, ship-based aircraft, and their crews. The organization of a fleet varies with the size, mission, and location of the navy. The U.S. Navy, for example, has separate fleets in the Atlantic and Pacific oceans. France has Atlantic and Mediterranean fleets. India's navy operates one fleet on India's western coast and a second fleet on its eastern coast.

Because ships are flexible in their operation, they can be organized in many combinations for different purposes. In most fleets, each ship is assigned to a permanent administrative unit called a *group, squadron,* or *division.* Large fleets may also organize their ships into

Detmar Modes, Bundesministerium Verteidigung

Navy personnel may be assigned to ships or bases on shore. This German naval officer serves aboard a small ship. From the *bridge* (navigational center), he watches a nearby auxiliary ship.

task forces. These are temporary groupings of ships formed to carry out a particular task. A task force may consist of one or more than a dozen ships, depending on the task. In the U.S. Navy, task forces are called *battle groups* when they contain one or more aircraft carriers.

Ships and aircraft

The world's navies operate many types of ships, ranging from huge aircraft carriers to small patrol boats. Navies also use many kinds of aircraft.

Mou Jianwei, Xinhua News Agency

Chinese sailors on the deck of a destroyer prepare a guided missile for launching. The large Chinese Navy operates mostly in coastal waters.

Aircraft carriers are the largest warships ever built. Carriers serve as mobile bases for many kinds of aircraft. Some carriers are designed for *conventional aircraft,* which would normally require a long runway. Conventional aircraft are launched from a carrier deck with the aid of a *catapult.* When the aircraft land, a device called a *tail hook* lowered from the rear of the plane catches one of the steel cables stretched across the deck. Only the Brazilian, French, Russian, and U.S. navies have conventional aircraft carriers.

Other carriers can serve as a base only for *V/STOL aircraft,* which take off vertically or from a short runway. V/STOL stands for *v*ertical/*s*hort *t*ake-*o*ff and *l*anding. Several navies have V/STOL carriers. Helicopters fly from both types of carriers.

Most carriers are armed with guns and missiles for short-range defense, but they depend on their aircraft and other warships for protection. Russian carriers are more heavily armed than carriers in other fleets.

Cruisers are the next largest warships. Navies use cruisers primarily to defend aircraft carriers against air and submarine attacks. Cruisers are armed with missiles, rockets, and torpedoes. Some cruisers also carry powerful long-range missiles for attacking targets on land. Only France, Italy, Peru, Russia, and the United States have cruisers.

Destroyers are similar to cruisers, but they are smaller and less costly to build. They are armed with guns, rockets, torpedoes, and missiles. A destroyer's main role is to escort and defend other ships, but destroyers also perform independent missions. Several of the world's navies have destroyers.

Frigates are the most common large warship in the world's navies. Navies use them chiefly to defend other warships and cargo ships against enemy submarines. Frigates are armed with torpedoes and other antisubmarine weapons. Most frigates also have guns, and some have missiles for defense against air and surface attacks.

Amphibious ships—often called *amphibs*—carry marines to enemy shores for operations on land. Amphibs use helicopters and landing craft to carry troops and their equipment ashore.

Submarines are warships that travel underwater. They can remain at sea, fully submerged, for long periods. They are extremely difficult for enemies to attack. Navies have two principal kinds of submarines: *attack submarines* and *ballistic missile submarines.* Attack submarines carry torpedoes and missiles. They primarily attack enemy surface ships and submarines. More than 40 navies have attack submarines. Ballistic missile submarines carry long-range ballistic missiles with nuclear warheads for attacking targets on shore. Only the navies of the United Kingdom, China, France, Russia, and the United States have ballistic missile submarines.

Zha Chunming, Xinhua News Agency

A destroyer from the Chinese fleet tests a guided missile for use against enemy ships, aircraft, and shore targets. Many types of warships may be armed with missiles.

Auxiliary ships are noncombatant ships, most of which support warships. *Underway replenishment* (UNREP) ships carry fuel, food, weapons, ammunition, and other supplies for warships at sea. Other auxiliary ships include supply and repair ships called *tenders,* hospital ships, tankers, salvage ships, and tugs.

Small combatants include missile and torpedo boats, minesweepers, and patrol boats. Small combatants operate mostly in coastal waters. Missile and torpedo boats have limited seagoing ability, but they carry powerful weapons for attacking larger ships. Minesweepers locate and destroy enemy mines. Patrol boats guard coastal waters.

Aircraft play a major role in modern naval operations. Navies use many types of aircraft, including fighter, attack, antisubmarine, cargo, and *reconnaissance* (observation) planes; and helicopters.

Major navies of the world

A powerful navy is modern, well trained, and can fight effectively. The world's largest navies belong to the United States, China, Russia, India, France, and the United Kingdom. The size of a navy does not necessarily reflect its fighting strength, however. For example, one aircraft carrier can provide as much striking power as can several cruisers or submarines. In addition, advanced weapons can give a small navy major striking power.

The United States has about 125 surface warships, including 12 conventional aircraft carriers. The carriers, 9 of which are nuclear powered, are the backbone of the United States fleet. In addition to surface ships, the United States Navy operates about 75 nuclear-powered submarines. Approximately 370,000 men and women serve in the United States Navy. Another 170,000 belong to the Marine Corps, a separate branch of the Department of the Navy.

China has a large navy, but many of its ships are old, and its sailors have spent little time training at sea. Thus, the effectiveness of the Chinese Navy has been limited. China's fleet operates mostly in coastal waters. The Chinese Navy has about 65 surface warships, plus more than 700 small combat craft. It also operates about 65 submarines, of which 6 are nuclear powered. Approximately 220,000 people, including marines, serve in the Chinese Navy.

Russia took control of most of the massive Soviet Navy after the Soviet Union broke apart in late 1991. Since then, Russia has taken many ships and submarines out of service because they cost too much to operate. Despite these reductions, the Russian Navy is still large, and most of its ships are modern.

The submarine is the most important ship in the Russian fleet. The Russian Navy has about 65 active submarines, about 50 of which are nuclear powered. Russia also has about 35 surface warships, including one conventional aircraft carrier. The Russian Navy has about 170,000 men, including marines.

India enlarged its navy during the 1980's as part of an arms build-up. India now has about 25 surface warships, including 1 conventional aircraft carrier. The Indian Navy's 16 submarines are all diesel-powered. About 53,000 people, including marines, serve in the Navy.

France has a small but modern, well trained, and effective navy. It has about 35 surface warships, including 1 conventional aircraft carrier. France also has 11 submarines, 10 of which are nuclear powered. About 50,000 people serve in the French Navy, including marines.

The United Kingdom has a small but effective navy. The navy of the United Kingdom, called the Royal Navy, operates about 35 surface warships, including 3 conventional aircraft carriers. The Royal Navy also has 16 submarines, all of which are nuclear powered. About 44,000 people, including marines, serve in the Royal Navy.

The history of navies

Ancient navies. By about 3000 B.C., the Egyptians were using small seagoing ships for military purposes. Between 2000 and 1000 B.C., the Greeks began building long, wooden ships called *galleys.* Galleys were propelled chiefly by oars, but most also had sails. Ancient Mediterranean civilizations used galleys to guard their coastlines and trading ships. Ancient galleys had pointed bows to ram other ships. Later, crews used *catapults* (weapons that resembled giant slingshots) to throw stones, hot coals, and pitch onto enemy ships.

In 483 B.C., the Greek city-state of Athens began to build a large fleet of galleys to defend itself against invaders from Persia. As a result, Athens soon became the dominant naval power in the Mediterranean Sea. Athens defeated the Persian fleet near the island of Salamis in 480 B.C. in the first naval battle for which an extensive record exists.

In 31 B.C., the fleets of two rival Roman leaders, Mark Antony and Gaius Octavian, fought a battle off Actium in western Greece. Antony was allied with Cleopatra, the queen of Egypt, and commanded their joint fleets. Octavian's fleet won the battle. He later became Emperor Augustus of Rome. Rome reigned as the supreme naval power in the Mediterranean for the next 250 years.

Navies in the Middle Ages. From the A.D. 700's to about 1100, bold Scandinavian sailors, now known as Vikings, raided coastal and river settlements throughout western Europe. In the late 800's, the English king Alfred the Great built a large fleet of galley warships to defend his country against Viking raiders.

During the 1200's, Europeans began to build ships with large, deep *hulls* (main bodies). Deep-hulled ships were faster and could travel more easily on the high seas than long, low galleys. Sails rather than oars became the principal means of propulsion, though some ships still used oars when there was no wind.

Most navies of the Middle Ages followed a standard battle plan. Attacking warships sailed alongside enemy ships and hurled rocks and flaming chemicals at them. Attackers then tried to ram or board enemy ships. After boarding, the crews fought hand-to-hand using swords, hatchets, and, later, guns. Some historians believe navies first used cannons during the 1300's. But naval guns did not come into wide use until the 1500's.

Between 1405 and 1433, a Chinese fleet led by Admiral Zheng He (also spelled Cheng Ho) made a series of seven expeditions to the Indian Ocean, the Middle East, and the eastern coast of Africa. These voyages established China as the unchallenged naval power in Asia for the first half of the 1400's. China's naval supremacy ended after leaders who disapproved of contact with foreigners took control.

The beginning of modern navies. The Italian city of Venice was the major sea power in the Mediterranean during the late Middle Ages. By 1400, Venice had a fleet of about 3,000 galleys. The Ottoman Empire, based in what is now Turkey, ranked as Venice's chief naval rival. In 1571, Venice, Spain, and their allies destroyed most of the Ottoman fleet in a battle off Lepanto in Greece. This was the last major battle between oar-driven galleys.

During the 1500's, Spain and England competed for control of the Atlantic Ocean. Both countries built ships called *galleons.* Galleons were large, sailing ships with three masts. In the late 1500's, English galleons began harassing Spanish galleons carrying gold and silver from the Americas. In response, Spain built a fleet called the Armada. In 1588, this fleet tried to invade England. But England's galleons were smaller and easier to maneuver than Spain's, and English crews were better trained. The English defeated the Armada. England (later the United Kingdom) dominated the Atlantic for the next 300 years.

The Netherlands competed with England for control of the seas during the mid-1600's. The two countries fought several naval battles that brought important changes in military tactics at sea. By this time, fleets had become large and difficult to command. Naval commanders began issuing instructions before a battle to coordinate the movements of their ships during the fighting. Large groups of ships were divided into squadrons. Commanders used flags to signal to other ships.

The largest warships were called *battleships* or *ships of the line* because they were positioned in the main line of battle. Opposing lines of battleships sailed on parallel courses and bombarded each other with cannon fire. In the Battle of Trafalgar, off the coast of Spain in 1805, British Admiral Horatio Nelson won a major victory by breaking through and disrupting the battle line of the opposing French and Spanish navies.

Engineering advances. In 1814, American inventor Robert Fulton built the first steam-powered warship. Steamships could cruise faster than sailing ships, and they could move against or without wind. But steamships faced a new problem. They needed fuel and had to depend on land bases to supply coal for refueling. Navies had to establish fueling stations overseas.

Improvements in the range, reliability, and accuracy of shipboard guns had a tremendous impact on naval warfare. During the 1820's, inventors developed naval guns that fired explosive shells rather than solid balls. In 1853, Russian ships fired the first explosive shells used in naval battle, destroying the wooden ships of the opposing Ottoman fleet during the Crimean War. In this war, Russia fought the allied forces of the United Kingdom, France, Sardinia, and the Ottoman Empire.

In the mid-1800's, shipbuilders began covering wooden hulls with heavy iron armor plates. Inventors developed rotating turrets so that naval guns could be fired in almost any direction without turning the ship. As the range and accuracy of guns increased, ships fought at

greater distances. Crews no longer boarded enemy ships and fought hand-to-hand, as in the sailing era.

In 1862, during the American Civil War, the Union's *Monitor* fought the South's *Merrimack* (then named the *Virginia*) in the channel of Hampton Roads in Chesapeake Bay. Neither ship was sunk. But this battle is famous because it was the first battle between two iron-armored ships. It was also one of the first battles between ships powered entirely by steam.

In 1906, the British completed the battleship *Dreadnought.* The *Dreadnought* carried more large guns and was faster than any previous battleship. It made all other battleships out of date, and it pushed Germany and Britain into a race of modern shipbuilding.

World War I began in 1914. In the war, the Allies, who included Britain, France, Italy, Russia, and the United States, fought Germany, Austria-Hungary, and other Central Powers. The war featured two new weapons that revolutionized naval war: submarines and airplanes. Submarines armed with torpedoes sank many enemy surface ships. Airplanes, flown from airfields ashore, attacked ships, submarines, and targets on land.

Most naval battles during World War I involved only small numbers of ships. The war's largest naval battle occurred in 1916, when Britain and Germany fought the Battle of Jutland, off the coast of Denmark. Although Britain lost more ships, it forced the German fleet to withdraw and remain in port for the rest of the war.

When World War I ended in 1918, Britain, Japan, and the United States were engaged in costly shipbuilding programs. After extensive negotiations, these and other nations agreed to limit warship construction. The Treaty of Versailles, which ended military action against Germany, barred Germany from building a large navy. But Germany violated the treaty by secretly building submarines for other countries. When German dictator Adolf Hitler rose to power in the early 1930's, he ordered the construction of a large navy. Japan and the Soviet Union also began building major fleets in the 1930's.

World War II began in Europe in 1939. In that war, Germany, Italy, Japan, and smaller Axis nations fought the Allies, who included Britain, Canada, China, the Soviet Union, and the United States. Naval combat broke out in the Atlantic in 1939, when German warships began attacking British ships. Germany's goal was to cut off Britain's supply of food and war materials. Britain sank most of Germany's surface ships, forcing Germany to resort to submarine warfare. The Allies fought German submarines with airplanes, antisubmarine ships, radar, sonar, and underwater bombs called *depth charges.* In addition, the Allies were able to intercept and decode German radio messages, which helped them predict the movement of enemy submarines.

Naval combat began in the Pacific Ocean on Dec. 7, 1941. That day, Japanese bombers flying from six aircraft carriers made a surprise attack on the U.S. Pacific Fleet at anchor in Pearl Harbor in Hawaii. The Japanese sank or heavily damaged five U.S. battleships. But all of the U.S. Navy's aircraft carriers survived because none were then in Pearl Harbor. After the attack, aircraft carriers became the principal warship of the U.S. Navy.

The Battle of the Coral Sea, in May 1942, was the first naval battle fought entirely by carrier-based aircraft. Opposing Japanese and U.S. warships did not fire a single shot at an enemy ship. The Battle of Midway in June 1942 was the turning point for naval war in the Pacific. In this battle, the U.S. Navy sank four Japanese aircraft carriers and one cruiser. The Battle for Leyte Gulf in the Philippines, in October 1944, was one of the largest naval battles in history. This series of actions involved about 280 Japanese and U.S. warships. The battle eliminated Japan as a major naval power.

By the time Japan surrendered in 1945 and World War II ended, only the United States and Britain still had major navies. The U.S. fleet was much larger than the rest of the world's seagoing forces combined.

Navies during the Cold War. The Cold War was a period of intense rivalry that developed after World War II between Communist and non-Communist countries. During this period, many countries carried out naval building programs. Many small navies were modernized with the addition of submarines, missiles, and other advanced weapons. The Soviet Union began a drive to enlarge and modernize its fleet in the late 1940's.

After World War II, aviation experts predicted that aircraft carrying nuclear bombs would be the principal weapon in future military conflicts. As a result, the U.S. Navy concentrated on building aircraft that could fly from large carriers and carry nuclear bombs.

The Korean War (1950-1953) proved, however, that conventional naval forces were still vital to modern conflicts. In this war, the United States and other members of the United Nations aided South Korea against North Korea, which was backed by China and the Soviet Union. Airpower was not the deciding factor in ending the war, and neither side used nuclear weapons. During the war, the U.S. Navy launched carrier-based air attacks, made amphibious landings, and used shipboard guns to bombard enemy coastal targets.

In 1954, the U.S. Navy launched the world's first nuclear-powered ship, the submarine *Nautilus.* The first Soviet nuclear submarine was completed about five years later. The first nuclear-powered surface warships were the U.S. aircraft carrier *Enterprise* and the cruiser *Long Beach,* both completed in 1961. By the mid-1960's, both the Soviet Union and the United States had submarines with ballistic missiles carrying nuclear warheads.

The world's navies were involved in numerous conflicts during the Cold War period. For example, in 1962, the U.S. Navy blockaded Cuba to force the Soviets to remove missiles and aircraft they had brought to the island. The U.S. Navy saw combat in the Vietnam War after the United States became heavily involved in the war in 1965. The U.S. Navy also played a major role in the Persian Gulf War in 1991. In 1982, the United Kingdom's Royal Navy battled Argentina for control of the Falkland Islands in the South Atlantic Ocean. The Royal Navy was victorious, proving that it could fight against modern weapons at great distances from the United Kingdom.

Navies after the Cold War. The Cold War ended in the early 1990's, after the Soviet Union broke apart and democratic reforms took place in Eastern Europe. Tensions eased between countries that had considered each other enemies.

Many countries, including the United Kingdom, Russia, and the United States, began reducing their navies. Older ships were cut up for scrap metal, newer ships were placed in reserve, and fewer new ships were built. Both Russia and the United States began reducing their fleets of ballistic missile submarines. However, some smaller navies, including those of France, India, and Israel, continued to build and modernize their fleets. Several of the former Soviet republics, especially Ukraine, began to build their own navies in the 1990's. Ukraine also took over a number of small ships that had belonged to the Soviet Navy. Navy, Department of the, is one of the three military departments within the Department of Defense of the United States government. The department is responsible for having naval and marine forces trained and ready to carry out military missions ordered by the president or the secretary of defense.

The Department of the Navy has three parts: (1) the Navy Department, (2) the Operating Forces, and (3) the Shore Establishment. The Navy Department is the central executive authority of the U.S. Navy. It is composed of the headquarters of the Navy and the U.S. Marine Corps in Washington, D.C. The Operating Forces consists of the fleets, including the Fleet Marine Forces, and other major sea commands. The U.S. Coast Guard functions as part of the Operating Forces in wartime or as directed by the president. The Shore Establishment operates within the United States. It performs a variety of technical activities that support the department's Operating Forces.

The *secretary of the Navy* heads the Department of the Navy, under the direction of the secretary of defense. The secretary of the Navy ranks equally with secretaries of the Army and the Air Force. The position carries general responsibility for all naval affairs. The principal civilian aides of the secretary of the Navy are an undersecretary, a deputy undersecretary, and four assistant secretaries.

The *chief of naval operations,* an admiral, is the Navy's highest-ranking military officer and a member of the Joint Chiefs of Staff. The chief is the principal naval adviser to the president and the secretary of the Navy on matters of war and the principal adviser and assistant to the secretary of the Navy.

The *commandant of the Marine Corps* is responsible for Marine Corps activities. The commandant reports directly to the secretary of the Navy.

The United States Congress authorized the establishment of the Navy Department in 1798. As a result of the National Security Act of 1947, the Navy Department was renamed the Department of the Navy in 1949. That same year, it was placed under the direction of the Department of Defense.

U.S. Navy

A nuclear-powered aircraft carrier, the U.S.S. *Abraham Lincoln,* joined the United States Navy's surface fleet in 1989. Carriers provide the fleet's main striking power.

Navy, United States, is the branch of the armed forces of the United States that acts to maintain command of the sea. In time of peace, the Navy often serves as an instrument of international relations. The very presence of naval vessels may be helpful in keeping a crisis from flaring into war. Navy ships also speed on errands of mercy, such as carrying food and medical supplies to disaster areas. Merchant vessels and passenger ships often call on the Navy for aid in emergencies.

In time of war, the Navy seeks out and destroys the enemy on, under, or above the sea. It can also strike the enemy ashore. In fact, if attacked, the Navy can return the blow almost anywhere on earth from its warships and aircraft. Powerful naval amphibious forces can support troop landings against heavy enemy resistance. Nuclear-powered submarines can carry missiles and travel around the world underwater. Any enemy that might attack the United States must expect counterblows from these submarines, whose exact locations at sea cannot be pinpointed.

To perform its functions efficiently, the Navy has many types of ships, including aircraft carriers, battleships, cruisers, frigates, destroyers, submarines, and amphibious type ships. These fighting ships depend on the services of ammunition ships, minesweepers, oilers, repair ships, supply ships, and tugs. Both fighting ships and service ships rely on a shore organization, including naval bases, shipyards, docks, naval air stations, and training stations, for supplies, repairs, training, and other services.

The U.S. Navy seal

Many people choose the Navy as a career because of their love of adventure and the sea. They may have an opportunity to visit many parts of the world.

The history of the U.S. Navy is a colorful story of daring deeds and famous ships at sea. It is the story of growth from a few sailing ships in Revolutionary War

days to the greatest fleet ever to sail the seas. It recounts the changes from sails and cannon to nuclear power and guided missiles. It blazes with the achievements of such historic ships as the *Bonhomme Richard, Constitution, Monitor, Olympia, Enterprise,* and *Nautilus.*

Naval history tells of John Paul Jones, whose battle cry, "I have not yet begun to fight," established the Navy's fighting traditions. It includes the achievements of James Lawrence, who rallied his men with the historic words: "Don't give up the ship!" It reflects the deeds of David G. Farragut, the Navy's first admiral, who reportedly bellowed "Damn the torpedoes! Full speed ahead!" as his forces charged into Mobile Bay. It includes leaders such as Chester W. Nimitz, who directed the Pacific Fleet in its sweep from Pearl Harbor to Tokyo Bay, and Hyman G. Rickover, the father of the nuclear Navy. It shines with the names of famous ships, such as the *Nautilus,* the world's first nuclear-powered warship.

The Navy operates under the Department of the Navy. The Navy has an active strength of about 320,000 men and 52,000 women. Active naval reserve forces total about 180,000. The department also maintains a Marine Corps of about 170,000 and employs more than 125,000 U.S. citizens worldwide. In wartime, or by decision of the president, the Coast Guard also operates under the Department of the Navy.

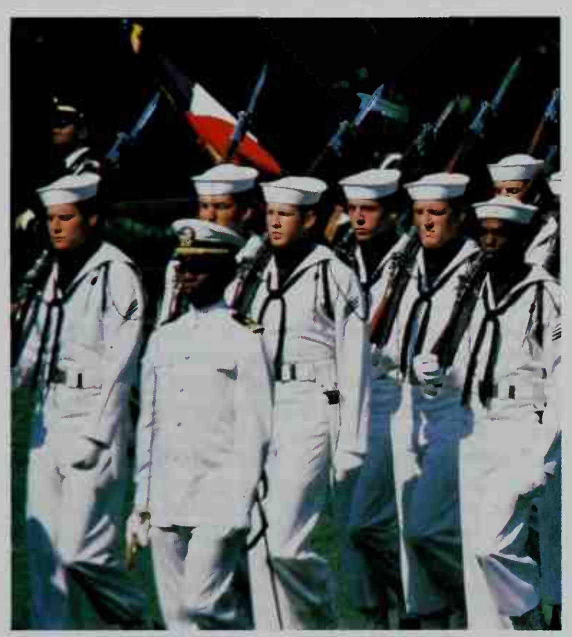
The Navy seal was adopted in 1957. "Anchors Aweigh" is the Navy's famous marching song. Blue and gold are the official colors of the Navy.

Life in the Navy

Training a sailor. The enlisted ranks consist of three grades of seaman and six grades of petty officer, from seaman recruit to master chief petty officer. Navy recruits first learn discipline and seamanship at a naval training center called a *boot camp.* They are called "boots" because, in early days, recruits wore leggings that looked like boots. Then they may attend a trade school, such as those for enginemen, cooks, and electricians. Or they may be assigned directly to a ship where they learn their duties and practice their trades. Sailors take competitive examinations for advancement through the *ratings* (ranks). Some may be qualified to attend advanced schools.

Enlisted women receive basic training at the naval training center in Great Lakes, Illinois. About half of them are assigned to advanced training schools, and the rest receive on-the-job training at naval bases. Qualified enlisted men and women can take examinations for admission to the U.S. Naval Academy at Annapolis, Maryland, or to other officer training programs.

Training an officer. Navy officers are trained at the U.S. Naval Academy or in the following naval programs: (1) the Naval Reserve Officers Training Corps (NROTC) for college and university students; (2) officer-candidate training for enlisted personnel and college graduates; (3) aviation-officer candidate programs for men and women with college degrees; and (4) programs to appoint warrant officers and limited-duty officers from the enlisted ranks.



Doctors, dentists, and ministers may be commissioned with little military training. Officer candidates train at the Naval Officer Candidate School, Newport, Rhode Island. The Navy admits women to all programs.

Naval officers are assigned to one of four divisions: (1) line, (2) staff, (3) limited duty, or (4) warrant. Unrestricted line officers command at sea or manage shore activities. Restricted line officers have highly specialized jobs, such as engineering or public affairs. Staff officers include doctors, dentists, nurses, supply officers, lawyers, and chaplains. Limited-duty or warrant officers are usually appointed from the enlisted ranks as administrative or technical specialists.

During officer training, officer candidates may apply for surface, submarine, or aviation duty. After about four years of active duty, they become eligible for many technical postgraduate programs. Senior-ranking officers may take command and strategy courses at the Naval War College in Newport, Rhode Island, or at one of the joint service colleges, such as the National War College in Washington, D.C.

A typical day. Life at sea for *bluejackets* (sailors) varies with the type of ship they are on. Naval ships range from tugboats with a crew of five to giant aircraft carriers with a crew of thousands. Cargo ships spend long periods at sea. Repair ships usually stay in port, but they are sometimes sent overseas to support operating forces. A sailor on a submarine gets to know every member of its crew. But on an aircraft carrier, each crew member does a specialized job and may never even see many areas of the ship.

In peacetime aboard a naval ship, a typical day begins about 6 a.m. Meals are generally served at 7 a.m., noon, and 5 p.m. These hours may vary to meet operating requirements. The crew *musters* (assembles) at 8 a.m., after breakfast. Practically every crew member on a ship *stands watch,* or is at a post of duty, during four-hour periods. Each member has a battle station and a post for emergencies.

© Alon Reininger, DPI

Inspection in the ranks may be held ashore or aboard a ship. These Navy enlisted men are undergoing inspection with weapons. The officer marches in front.

The Navy tries to make life aboard ship as comfortable and pleasant as possible for sailors who may have to live in limited space for weeks or months at a time without seeing land. Some ships have a library for the crew, and many have recreation rooms and hobby shops. Most ships have on-board television and radio stations. Tailor and shoe-repair shops, laundries, and stores located on the ship provide for the crew's everyday needs. On large ships, doctors and dentists care for the sailors' health. When a ship is in port, crew members who are not on duty may be granted *liberty* (time off ashore).

Careers in the Navy. A sailor has a chance to see much of the world. A first enlistment may prepare a person for a civilian job or a naval career. Applicants must be U.S. citizens between the ages of 17 and 34, and must meet the Navy's physical standards. A man or woman may enlist for four to six years.

Qualified enlisted personnel may advance to chief petty officer in 12 to 14 years. They receive a pay increase with each promotion, and extra pay according to length of service. The Navy also pays money for *quarters* (housing) and *subsistence* (food). It gives additional pay for hazardous duty, such as submarine and aviation duty, and for sea duty and duty in some foreign countries. All Navy personnel are eligible for 30 days' *leave* (vacation) a year. They are entitled to free medical and dental care, and free hospital and medical care is available to their families. Men and women in the Navy may retire with pay after 20 years' service.

Ships and weapons of the Navy

Combat ships of the U.S. Navy include warships, amphibious warfare ships, and mine warfare ships. Smaller vessels, called *light combatant craft,* patrol coastlines, land troops, and operate on rivers and other shallow waterways. This section discusses the U.S. Navy's warships. For information on amphibious warfare ships and mine warfare ships, see **Amphibious ship; Mine warfare**.

The U.S. Navy's *aircraft carriers* are its largest warships. Special helicopter and troop *carriers* take part in helicopter amphibious assaults. *Battleships,* the largest nonaviation ships, bombard enemy shore positions and attack enemy ships. *Guided missile cruisers* are used mainly to escort aircraft carriers. *Destroyers* defend amphibious ships and large warships. Some destroyers carry helicopters that can attack submarines. *Frigates* escort other warships and amphibious ships and are also used for patrol duty. *Submarines* operate against surface ships, other submarines, and shore positions. *Command ships* carry communications equipment and serve as command headquarters.

Auxiliary ships provide maintenance, fuel, supplies, towing, and other services to warships. There are four main kinds of auxiliary ships: (1) underway replenishment ships, (2) fleet support ships, (3) sealift ships, and (4) experimental, research, and surveying ships. *Service craft* generally are smaller vessels that provide services similar to those of auxiliary ships.

Underway replenishment (UNREP) ships provide fuel, ammunition, food, spare parts, and other materials to warships at sea. UNREP ships transfer cargo to moving ships using lines rigged between the ships.

Fleet support ships provide maintenance and towing services to warships. Destroyer tenders, submarine tenders, and repair ships have machine shops that can repair the engines, weapons, and electrical systems of warships. Oceangoing tugs provide towing services to warships.

Sealift ships carry cargo from port to port but cannot land their cargo on beaches. Unlike UNREP ships, they cannot transfer cargo to moving ships.

Experimental, research, and surveying ships support warship development and operations. Experimental ships test hull designs, weapons, and other equipment. Research ships are used in studying the ocean and the ocean floor. Surveying ships map the ocean floor and coastlines.

Naval aviation enhances the defense of the fleet, joins amphibious attacks, and conducts strikes on ships and shore targets. Navy pilots fly attack, fighter, and special mission planes and helicopters from carriers. They also fly shore-based patrol aircraft. Carrier-based aircraft are built to withstand the great stress of take-off and landing. Their wings can be folded to reduce the amount of storage space needed.

Navy attack aircraft include the light attack A-7 Corsair II and the medium attack A-6 Intruder. Fighters are the F-14 Tomcat and F/A-18 Hornet. Navy aircraft can carry a variety of *ordnance* (weapons), including guided missiles and nuclear warheads.

Special mission aircraft that operate from carriers include the S-3 Viking, which has electronic and radio devices to find and track submarines. The EA-6B Prowler is an electronic warfare plane used to interfere with enemy electronic equipment. The P-3 Orion is a land-based antisubmarine warfare plane. The SH-60 Seahawk is a ship-based antisubmarine helicopter.

Naval aircraft are classified by letters and numbers. For example, the F-14D is the fourteenth fighter (F) in the Department of Defense system. The letter *D* indicates that it is the fourth model of the F-14. Other letters are *A,* attack; *E,* special electronic installation; *C,* cargo/transport; *H,* helicopter; *K,* tanker; *O,* observation; *P,* patrol; *S,* antisubmarine; *T,* trainer; *U,* utility; *V,* vertical or short take-off and landing; and *X,* research.

Ordnance includes bombs, guns, mines, missiles, and torpedoes. Battleships carry the Navy's largest guns. These are 16-inch guns that can hurl shells more than 20 miles (32 kilometers). Cruisers and destroyers carry 5-inch guns that can shell targets more than 10 miles (16 kilometers) away. Surface warships also carry 3-inch rapid-fire guns for defense against enemy aircraft.

Naval mines may be fixed, moored, or mobile. Rockets such as ASROC and SUBROC combat submarines. The Navy has air-launched, surface-launched, and subsurface-launched torpedoes. They can be used against surface ships or submarines.

Missiles. Surface-to-air missiles include the Standard II, Tartar, and Terrier missiles, with ranges from 10 to 25 miles (16 to 40 kilometers) or more. Air-to-air missiles include Phoenix, Sidewinder, and Sparrow. Such air-to-surface missiles as Harpoon and HARM are used to support ground troops or hit targets at sea. The Poseidon can be launched underwater to blast targets up to 2,500 miles (4,020 kilometers) away. Trident missiles have a range of about 4,000 miles (6,400 kilometers). Underwa-

ter-to-air-to-underwater missiles are launched from submarines. See **Guided missile.**

Organization of the Navy

The U.S. Navy operates under the Department of the Navy in the Department of Defense. The Department of the Navy consists of the (1) Navy Department, (2) Operating Forces, and (3) Shore Establishment. The secretary of the navy, a civilian, heads the Department of the Navy under the direction of the secretary of defense. The secretary of the navy is responsible for the policies and control of the Department of the Navy.

The Navy Department, located in Washington, D.C., is the central executive authority of the Department of the Navy. The Navy Department establishes policy, directs, and controls the Operating Forces and Shore Establishment. It includes the offices of the secretary of the navy, chief of naval operations, chief of naval personnel, chief of naval research, and commandant of the marine corps.

The Operating Forces perform naval operations to carry out U.S. policies and advance U.S. interests. The main parts of the Operating Forces are the *U.S. Atlantic Fleet,* the *U.S. Pacific Fleet,* and their *fleet marine forces* (expeditionary troops), who are members of the Marine Corps. The U.S. Atlantic Fleet, headquartered at Norfolk, Virginia, provides forces for the Second Fleet in the western Atlantic; the Sixth Fleet in the Mediterranean; and the Middle East Force in the Indian Ocean area, including the Persian Gulf. The Pacific Fleet, headquartered at Pearl Harbor, Hawaii, is made up of the Third Fleet in the eastern Pacific and mid-Pacific, and the Seventh Fleet in the western Pacific.

Also in the Operating Forces are the Naval Reserve; the Mine Warfare Command; and the Operational Test and Evaluation Force, which tests and evaluates weapons systems, ships, aircraft, and other equipment. Another part of the Operating Forces, the Military Sealift Command, consists of noncombatant ships and commercial vessels manned by civilian crews. This command transports bulk cargo for the Department of Defense and its divisions. It also provides naval fleet auxiliary forces to support U.S. Navy operations worldwide and operates ships for projects of other U.S. agencies. The command is partly responsible for restocking ships at sea with fuel, food, and other supplies.

The Shore Establishment operates naval bases and other installations that support the Operating Forces. A naval base may include a shipyard, a naval station, or a naval air station. Other installations in the Shore Establishment are hospitals, research laboratories, naval training centers, technical schools, supply depots, and communications stations. In addition, the Shore Establishment assigns officers as *naval attaches* to the diplomatic staffs of ambassadors or ministers to foreign countries. Naval attaches openly collect information about the military capabilities of other countries.

Regulars and reserves. The *Regular Navy,* or *Active Navy,* is the permanent professional naval force. It consists of men and women who join the Navy as a career.

The *Naval Reserve* consists of the *Ready Reserve,* the *Standby Reserve,* and the *Retired Reserve.* The Naval Reserve provides trained units and qualified individuals for active duty in time of war or national emergency.

The Ready Reserve is the core of the Naval Reserve. Its members are ready to be immediately mobilized. Ready reservists may be on active duty or in inactive duty status. *Selected reservists* are ready reservists who train for two days a month at naval reserve centers or naval air stations and perform two weeks of active duty a year.

Standby Reserve and Retired Reserve members are subject to recall in a war or national emergency. But they do not get the amount or regularity of training that selected reservists do, and so they would be mobilized only after selected reservists were called up.

Women in the Navy do not form a separate organization or unit, except for those in the Navy Nurse Corps. Women other than nurses serve as enlisted or commissioned personnel in the Regular Navy or in the Naval Reserve. Nurses serve as commissioned officers in the Naval Reserve and may transfer to the Regular Navy.

Navy women are trained, assigned, paid, and administered under essentially the same policies as are Navy men. They have the same service rights and benefits. Women are not assigned to combat units, but they may serve at overseas bases and on noncombatant ships. Navy nurses may serve in combat zones.

Women first served in the Navy during World War I. They performed *yeoman* (clerical and secretarial) duties to release enlisted men for active duty at sea. In 1942, during World War II, Congress authorized the establishment of the Women's Reserve of the United States Naval Reserve. Navy women became known as *WAVES,* the abbreviation for the full name of this organization, *W*omen *A*ccepted for *V*olunteer *E*mergency *S*ervice. Mildred H. McAfee, a distinguished educator, was the first director of the WAVES (see **McAfee, Mildred H.**).

In 1948, women officially became a permanent part of the Regular Navy and the Naval Reserve. The term *WAVES* is no longer an official title. Navy women are referred to as women officers and enlisted women.

The Marine Corps is a separate military service within the Department of the Navy. Its commandant is responsible directly to the secretary of the navy. The corps assigns fleet marine forces to the Atlantic and Pacific fleets. The Marines have the primary jobs of amphibious warfare and land operations performed in connection with naval campaigns. They also provide security forces that guard naval stations and ships and United States embassies in other countries. See **Marine Corps, United States.**

The Coast Guard operates under the Department of the Navy in wartime or by decision of the president. The Coast Guard provides air-sea rescue services, carries out antisubmarine patrols, and controls and guards shipping in U.S. ports. It also helps to prevent waterfront disasters, to enforce U.S. laws at sea, and to ensure safety at sea. See **Coast Guard, United States.**

History

The earliest colonial warships were privately owned vessels called *privateers.* These vessels usually operated on independent missions (see **Privateer**).

The Continental Congress established the Continental Navy in 1775. The Congress set up a Naval Committee and later a Marine Committee to administer naval affairs and to build and equip warships. Several merchant

ships were converted into combat vessels. In 1776, Esek Hopkins, the Navy's first commodore and its first commander in chief, raided Nassau in the Bahama Islands with a fleet of six ships. During the Revolutionary War, about 60 vessels served in the Continental Navy. Captain John Paul Jones's badly damaged *Bonhomme Richard* forced the British vessel *Serapis* to surrender in one of the war's most exciting battles. Jones uttered the Navy's famous watchword: "I have not yet begun to fight!" See **Revolutionary War in America**.

The Navy ceased operations after the war. In 1785, the last warship was sold. But the need for a fleet soon arose again. Barbary *corsairs* (sea raiders) off North Africa preyed on American merchant ships and killed or captured American sailors. In 1794, Congress voted to build several *frigates* (at that time, fast, three-masted warships) to fight the corsairs. This force operated under the secretary of war. The launching of the *United States* in 1797 marked the rebirth of the U.S. Navy.

Undeclared war with France. In the summer of 1796, the United States and France had reached a state of undeclared war. France and Britain were at war with each other at this time. The French treated U.S. merchant sailors like British subjects and, by 1798, had seized over 300 U.S. merchant ships. That year, Congress created a Navy Department under a secretary of the Navy. The 44-gun frigates *Constitution* and *United States* and the 36-gun *Constellation* formed the basis of a new fleet that had grown to about 50 ships by 1801. Many battles raged between U.S. and French ships. The undeclared war with the United States ended after Napoleon Bonaparte seized power in France in 1799.

The War of 1812 (1812-1815). Britain declared a blockade of France when war broke out in 1803. It seized American ships that violated the blockade, and imprisoned their seamen. The U.S. Navy had only about 16 warships when the War of 1812 began.

In early victories, the *Constitution* captured and destroyed the British ships *Guerrière* and *Java,* and the *United States* captured the *Macedonian.* The British *Shannon* captured the American *Chesapeake.* Captain James Lawrence of the *Chesapeake* issued as his dying command: "Don't give up the ship!" The British clamped a tight blockade on American ports, but American privateers continued to operate. They captured more than 1,300 enemy vessels and damaged British overseas trade. American ships won decisive victories on Lake Erie and Lake Champlain. See **War of 1812**.

In the Mexican War (1846-1848), the Navy conducted amphibious operations and blockaded ports along Mexico's Gulf and Pacific coasts.

The Civil War (1861-1865) found the Union Navy with only 42 ships. Within a month after the war began on April 12, 1861, the Navy had blockaded the Southern States from Virginia to the Rio Grande to keep them from exporting cotton and importing supplies. The Confederacy countered with naval commerce raiders and blockade runners, which were operated independently. In March 1862, the first battle between ironclad ships occurred at Hampton Roads, Virginia. The clash between the Confederate *Virginia* (*Merrimack*) and the Union *Monitor* ended in a draw but introduced a new kind of naval warfare (see **Monitor and Merrimack**).

Navy gunboats helped Union forces control the Tennessee, Cumberland, and Mississippi rivers, which led to the siege and capture of Vicksburg, Mississippi, in 1863. See **Civil War** (Siege of Vicksburg).

In August 1864, Rear Admiral David G. Farragut ran his fleet past defending forts at Mobile Bay, Alabama, and forced a Confederate fleet in the harbor to surrender. As Farragut entered the bay, he reportedly shouted, "Damn the torpedoes! Full speed ahead!"

The Navy played an important role during the Civil War. It was essential to the success of the land armies, and showed the powerful effect of control of the seas. The Union Navy came out of the war as the largest and most powerful naval force in the world. It had more than 670 ships and 57,000 men. See **Civil War**.

The Spanish-American War (1898) saw two major naval battles. On May 1, Commodore George Dewey's squadron steamed through the entrance to Manila Bay in the Philippines. As his flagship *Olympia* approached the Spanish fleet off Cavite, he gave the historic command: "You may fire when you are ready, Gridley." The battle ended with the 10-ship enemy fleet destroyed or burning. On July 3, Commodore Winfield S. Schley's warships defeated a Spanish fleet outside Santiago harbor in Cuba. See **Maine** (ship); **Spanish-American War**.

"The Great White Fleet." A force of 16 battleships and 4 destroyers of the Atlantic Fleet began a 14-month world cruise in 1907. It was called "the Great White Fleet," because the ships had been painted white. The 46,000-mile (74,000-kilometer) cruise proved that the Navy could easily shift from the Atlantic to the Pacific.

The Navy took two other major steps in the early 1900's. In 1915, it established the office of chief of naval operations. Admiral William S. Benson was the first to fill this position. Naval aviation was born during this same period. In 1911, the Navy purchased its first airplane. Shortly before, on Nov. 14, 1910, Eugene Ely had made the first shipboard take-off from a warship, the cruiser *Birmingham.* By 1914, the Navy had established its first permanent naval air station at Pensacola, Florida, and in 1922, it commissioned its first aircraft carrier, the *Langley.*

World War I (1914-1918) began for U.S. combat forces on May 4, 1917, when a destroyer division docked in Ireland for duty with Britain's Royal Navy. In April, Rear Admiral William S. Sims had arrived in London to command U.S. Naval Forces in European waters. The British predicted an Allied defeat in six months unless the German submarine attacks could be stopped. The Allied navies began convoys and assigned destroyers and submarine chasers to the Atlantic.

The Navy developed new types of mines and laid a mine *barrage* (field) in the North Sea. It planted about 56,000 mines in the largest mining operation in history. During the war, the Navy transported more than 2 million American soldiers across the Atlantic Ocean without a single loss of life. Naval aviation expanded rapidly with the establishment of bases in Europe. Navy pilots flew *reconnaissance* (observation), antisubmarine, and bombing missions. The Navy also mounted five 14-inch (36-centimeter) guns on railroad cars for strategic shelling of German railways and supply depots in 1918. See **World War I**.

After World War I, the Navy entered a period of decline. It scrapped, sank, or demilitarized about 2 million

long or metric tons of ships, including 31 major warships, according to a treaty signed at the Washington Conference of 1921 and 1922 (see **Arms control**). By the 1930's, the United States had again started building ships. It planned a two-ocean Navy.

World War II (1939-1945). The Japanese attack against the Pacific Fleet at Pearl Harbor, Hawaii, on Dec. 7, 1941, brought the United States into World War II. Nearly four years later, the war ended with surrender ceremonies held aboard the battleship *Missouri* in Tokyo Bay, Japan.

The Navy had begun defense activities as early as 1939. The destroyer *Reuben James* became the Navy's first casualty of the undeclared war in the Atlantic when it was sunk by a German submarine on Oct. 31, 1941.

The Navy recovered quickly from its losses at Pearl Harbor. It salvaged and repaired many of the damaged or sunken ships. Admiral Ernest J. King became commander in chief of the United States Fleet. In addition, he later served as chief of naval operations. Admiral Chester W. Nimitz took command of the Pacific Fleet, and Admiral Royal E. Ingersoll commanded the Atlantic Fleet. By June 1942, the Navy's decisive victory in the Battle of Midway marked the end of Japanese expansion in World War II. When the war ended, the Navy had the most powerful fleet ever. It had 3,400,000 men and women and 2,500 ships, including 24 battleships, 35 aircraft carriers, 77 escort carriers, 92 cruisers, 501 destroyers, 406 destroyer escorts, and 262 submarines. See **World War II.**

The Korean War (1950-1953) involved naval forces almost immediately after the conflict began. Aircraft carriers and troop transports played vital roles in holding the Pusan perimeter during the first three months of the war. On Sept. 15, 1950, an amphibious landing at Inchon helped reverse the course of the war. A feature of the ground battles was the success of naval and marine close air support, with aircraft and infantry operations closely coordinated. See **Korean War.**

The Vietnam War (1957-1975). The U.S. Navy entered combat in South Vietnam in 1964. The Seventh Fleet launched air strikes from aircraft carriers and bombarded enemy forces and positions ashore from cruisers, destroyers, and the battleship *New Jersey.* The Navy's Coastal Surveillance Force, River Patrol Force, and Riverine Assault Force operated along the coast and on rivers of South Vietnam. By March 29, 1973, the Navy had turned its responsibilities in Vietnam over to the South Vietnamese armed forces. See **Vietnam War.**

The Persian Gulf War (1991). In August 1990, the United States sent naval forces to the Persian Gulf after Iraq invaded Kuwait. In January 1991, war broke out between Iraq and a multinational force led by the United States. United States Navy planes conducted strikes against Iraqi troops and military installations. The battleships *Wisconsin* and *Missouri* bombarded Iraqi targets ashore. During the brief ground war, fought in late February, the threat of an amphibious landing of U.S. Marines in Kuwait kept as many as six Iraqi divisions pinned down. See **Persian Gulf War.**

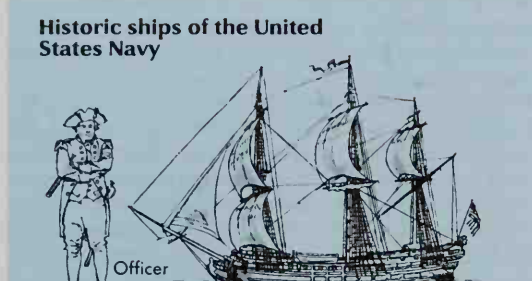
The nuclear age Navy. In 1948, the U.S. Navy and the Atomic Energy Commission established a joint program to develop nuclear-powered submarines. Unlike conventional submarines, which burn fuel oil, nuclear submarines do not require air for combustion. They can thus travel long distances underwater. In 1954, the Navy commissioned the world's first nuclear-powered submarine, the *Nautilus.* In 1981, the Navy commissioned the *Ohio,* the first nuclear submarine armed with powerful Trident missiles. Today, the Navy has about 95 nuclear submarines, all of which carry missiles.

The U.S. Navy also developed nuclear-powered surface ships, which can steam at high speed for long distances without refueling. The Navy's first nuclear surface ships, the cruiser *Long Beach* and the aircraft carrier *Enterprise,* were completed in 1961. Today, more than 40 percent of the Navy's fighting vessels are nuclear powered.

In 1975, the lead ship of the *Tarawa (LHA-1)* class of amphibious warfare ships was commissioned. This class of vessel transports landing craft and provides a flight

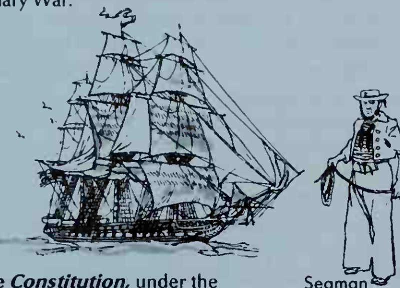
Important dates in Navy history

1779 John Paul Jones's *Bonhomme Richard* outfought the *Serapis* and gave the Navy its famous watchword: "I have not yet begun to fight."
1794 The United States Navy was formally established in a law providing for ship construction.
1812 The *Constitution* under Isaac Hull overwhelmed the British ship *Guerrière* in the War of 1812.
1813 James Lawrence and the *Chesapeake* fell before the cannons of British warship *Shannon.* The dying Lawrence commanded: "Don't give up the ship!"
1862 The first battle between ironclad warships was fought between the *Monitor* and the *Merrimack* (*Virginia*).
1864 A Union fleet stormed into Mobile Bay as its commander, David Farragut, reportedly bellowed: "Damn the torpedoes! Full speed ahead!"
1898 The United States fleet under George Dewey crushed the Spanish fleet in Manila Bay.
1942 The Pacific Fleet repulsed a Japanese fleet that threatened Midway Island and Hawaii.
1944 In the biggest naval battle in history, the Pacific Fleet destroyed Japanese sea power off Leyte Gulf.
1958 The world's first nuclear submarine, *Nautilus,* cruised beneath the North Pole, the first ship to reach it.
1964 A nuclear-powered task force cruised around the world.
1972 Alene B. Duerk became the first woman in the Navy to be promoted to the rank of rear admiral.
1976 Samuel Lee Gravely became the Navy's first black vice admiral.



Names of naval ships

Since the 1970's, the United States Navy has generally named various types of ships after people, places, or things, as follows:



Aircraft carriers—Public officials *(Theodore Roosevelt, Abraham Lincoln, Dwight D. Eisenhower, Carl Vinson).*
Amphibious assault ships—Famous Navy ships *(Wasp).*
Battleships—States *(New Jersey).*
Cruisers—Battles *(Ticonderoga, Yorktown)* or states *(California, Virginia).*
Destroyers—Officers and enlisted personnel of the Navy and Marine Corps, Navy secretaries, members of Congress, or inventors who influenced naval matters *(Kidd, Coontz, Adams, David R. Ray, Fife).*
Frigates—Deceased Navy, Marine Corps, or Coast Guard personnel *(Lewis B. Puller, Jack Williams).*
Minesweepers—Descriptive qualities *(Avenger)* or birds *(Cardinal).*
Submarines—Trident ballistic missile submarines are named for states *(Ohio, Alaska).* Attack submarines are named for cities *(Los Angeles, Chicago).*

Historic ships of the United States Navy

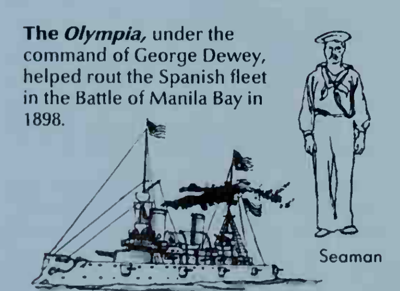
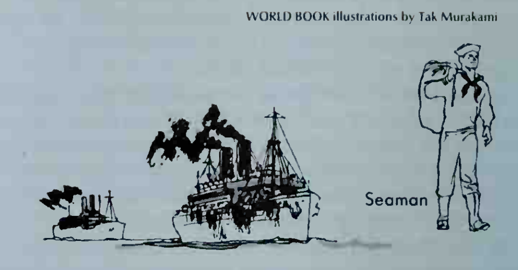
The ***Bonhomme Richard,*** commanded by John Paul Jones, outfought the British ship *Serapis* in the Revolutionary War.

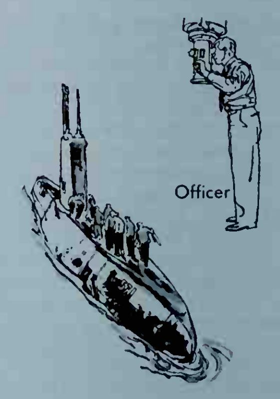




The ***Constitution,*** under the command of Isaac Hull, destroyed the British frigate *Guerrière* during the War of 1812.

A Civil War clash in 1862 between the Union *Monitor* and the Confederate *Merrimack,* also called the *Virginia,* was the world's first battle between ironclad ships. The flat-topped *Monitor* was built of iron, but the *Merrimack* was a wooden frigate covered with iron plates.

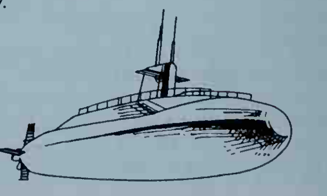
The ***Olympia,*** under the command of George Dewey, helped rout the Spanish fleet in the Battle of Manila Bay in 1898.



Transports carried more than 2 million American troops to fight in France during World War I.

Officer

The ***Enterprise*** and other fast aircraft carriers formed the backbone of the U.S. Navy during World War II.



Seaman

The ***Missouri*** was the scene of the surrender ceremonies with Japan that marked the end of World War II.

The ***Nautilus*** was the first nuclear submarine. It made the first undersea cruise beneath the North Pole in 1958.

An *Ohio* class submarine, which carries Trident missiles, is the largest and most powerful submarine in the U.S. Navy.

deck for helicopters and vertical/short take-off and landing (V/STOL) aircraft. In 1989, the Navy launched the lead ship of the *Arleigh Burke (DDG-51)* class of destroyers with weapons for fighting surface ships, submarines, and aircraft. In 1997, the *Seawolf (SSN-21)* class of nuclear-powered attack submarines was put in service.

Nazarbayev, *NAHZ ahr BY ehf,* **Nursultan,** *NUR suhl TAHN* (1940-), was elected president of Kazakhstan in 1991. Kazakhstan, formerly part of the Soviet Union, declared its independence shortly after the election.

As president, Nazarbayev has worked to replace Kazakhstan's traditional government-run economy with one that promotes free enterprise. To do this, his government has sold some state-owned factories and farms to private citizens. He has opposed all efforts to split Kazakhstan into two countries, one inhabited chiefly by its Kazakh people and the other by its Russian people. Nazarbayev has been criticized for increasing his power as president and for restricting freedom of the press.

ITAR-Tass from Sovfoto
Nursultan Nazarbayev

Nazarbayev was born near Almaty. He graduated from the Technical University at Qaraghandy Metallurgical Combine in 1967. From 1984 to 1989, Nazarbayev was prime minister of the Soviet republic of Kazakhstan. He was first secretary of the Kazakh Communist Party from 1989 to 1991. In 1990, the Supreme Soviet (legislature) elected him president of Kazakhstan. He quit the Communist Party in 1991 as the Soviet Union fell apart. William Fierman

Nazareth, *NAZ uhr uhth* (pop. 52,200), is a town in northern Israel. For the location of Nazareth, see **Israel** (political map). It was the home of Jesus Christ during His early youth. The town was in the Roman province of Galilee (see **Galilee**).

The Old Testament does not mention Nazareth. Nathanael in the New Testament expressed the attitude of the times about the village when he said, "Can there any good thing come out of Nazareth?" (John 1:46).

Nazareth remained insignificant for many years after the time of Christ. But pilgrims visited the town about A.D. 600, and a large basilica was built. The Arabs captured the city in the 600's. The Crusaders built several churches there, but the Ottomans, who were Muslims, forced Christians to leave in 1517.

A new town of Nazareth stands on the site of the old town. The population of Nazareth today is far more than its population in Biblical times. The Latin Church of the Annunciation, completed in 1730, now rises where some people think the home of Mary, the mother of Jesus, stood. Since the 1700's, several religious denominations have constructed churches and monasteries in Nazareth. An ancient well, called Mary's Well, still flows, and people still take water from it. Bernard Reich

Marilyn Bridges

Nazca lines include giant figures etched into the earth's surface by the Nazca people of ancient Peru. One of the figures, a bird-like drawing, is shown in the aerial photograph above. This figure measures about 450 feet (135 meters) from head to tail.

Nazca, *NAHS kuh,* was an American Indian culture that thrived in the coastal desert of what is now southern Peru from as early as 100 B.C. to A.D. 800. The Nazca people are known for the huge etchings they made in the surface of the desert and for their colorful pottery. The name of the culture is also spelled *Nasca.*

The desert etchings, called the *Nazca lines,* include sets of parallel lines, and the outlines of animals and geometric shapes. Some of the lines are several miles long, and some of the animal figures measure more than 400 feet (120 meters) in length. The Nazca made the markings by removing dark surface rocks to expose light-colored sand underneath. The Nazca may have used the markings to follow the positions of stars in the night sky and thus to keep track of the seasons.

Nazca pottery includes bowls and other vessels and such musical instruments as pipes, drums, and rattles. The Nazca decorated much of the pottery with plant and animal designs. Some vessels are shaped like animals or people. The Nazca also wove cotton and wool textiles.

The Nazca lived in villages. They built their homes of canes tied together and covered with mud. Larger structures were made of adobe. The Nazca used irrigation to grow corn and other crops. About A.D. 800, the Nazca culture became mixed with the Huari Indian culture, possibly after an invasion of the Nazca region.

Alexandra M. Ulana Klymyshyn

Nazism, *NAHT sihz uhm* or *NAT sihz uhm,* was a political movement—and later a form of government—that developed in Germany during the 1920's. The Nazis, led by the dictator Adolf Hitler, controlled Germany from 1933 to 1945. *Nazism* also describes any governmental system or political beliefs resembling those of Hitler's Germany. The word is also spelled *Naziism.*

Nazism was a *fascist* movement—that is, it tightly restricted personal freedom but permitted private ownership of property. The Nazis called for aggressive nationalism, militarism, and the expansion of Germany's borders. They glorified the Germans and other northern European peoples, whom they called *Aryans.* They claimed that Jews, Slavs, and other minority groups were inferior. Nazism opposed democracy, Communism, socialism, feminism, and other political systems and movements that claimed to favor equality. It promised to build a harmonious, orderly, and prosperous society for Germans. Instead, it brought terrorism, war, and mass murder.

The birth of Nazism. Germany experienced political and economic crises after its defeat in World War I (1914-1918). A democratic government had replaced the monarchy that ruled the country. But the nation suffered from severe inflation and unemployment after the war ended. Many Germans lacked faith in the new government and began to turn to political groups that called for extreme changes. One of these organizations was the German Workers' Party, a small discussion group in Munich. Hitler joined this group in 1919 and quickly gained control. He changed its name to the National Socialist German Workers' Party in 1920. *Nazi* stands for the first word in the German name of the party.

Nazism responded to deep problems in German history. Germany had not become a united nation until 1871, and many Germans felt that Germany was inferior to other countries. This feeling of inferiority encouraged aggressive nationalism and a desire for expansion. Industry grew rapidly during the late 1800's and early 1900's and brought great wealth to the industrialists. But workers resented what they considered an unequal distribution of profits. In addition, many middle-class and upper-class Germans had lived comfortably under the monarchy, and they feared and disliked the newly formed democratic government. Finally, many Germans blamed their problems on Jews.

Hitler's aims were primarily nationalistic, but he also promised social revolution to win support from the masses. The Nazi Party grew rapidly in the postwar crisis. The military supported Hitler's ideas of discipline, order, and military conquest. The middle classes and farmers were attracted by the promise of social reform. Wealthy industrialists joined to fight Communism. Powerless people responded to ideas of racial superiority, *anti-Semitism* (prejudice against Jews), and German strength. By 1923, the Nazi Party had 17,000 members.

The rise to power. Nazism did not gain wide support until the Great Depression, a worldwide business slump, began in 1929. Discontented Germans then turned to Nazism in increasing numbers. Nazism promised economic help, political power, and national glory. Hitler's fiery personality and talents as an orator also had a strong influence. The Nazi Party grew into a huge political organization with special divisions for children, youth, women, and professional people. It even had soldiers called *storm troopers,* who terrorized opponents.

In the elections of 1932, the Nazis emerged as the strongest party in Germany. On Jan. 30, 1933, Hitler became *chancellor* (prime minister). He quickly moved toward dictatorship, outlawing civil liberties and all political parties except the Nazi Party. The Nazis took over the press, the radio, and the school system. In time, they established a *totalitarian state* (a government that permits no opposition). They organized a powerful secret police force called the *Gestapo* and set up concentration camps for anyone suspected of opposing Nazism. Jews

and members of other minority groups were also imprisoned in these camps, where the Germans either killed them or used them for forced labor.

Expansion, war, and collapse. Hitler and his followers hoped to make the Nazi state a world empire. In 1938, they began to carry out their plans. Germany annexed Austria in 1938. German forces occupied Czechoslovakia the following year. The Nazis attacked Poland later in 1939, and World War II began. The Nazis started a campaign to murder all European Jews. Hitler called this the "final solution." About 6 million Jews died by firing squad, in gas chambers, or by other methods. About 5 million others, including Gypsies, political opponents of the Nazis, and Poles and other Slavs were also killed. These mass murders later became known as the *Holocaust* (see **Holocaust**). The United States, the United Kingdom, the Soviet Union, and other nations defeated Germany in 1945, and the Nazi government collapsed.

Neo-Nazism. A number of small *neo-Nazi* (new-Nazi) parties have been founded in Germany since the end of World War II. They have sought to reestablish Nazi principles and to regain the lands Germany lost in the war. They also worked to reunify East Germany and West Germany, the two political units into which Germany was divided from 1949 to 1990. Neo-Nazis have promoted anti-Semitism. Some have denied that the Holocaust occurred. Neo-Nazi parties have gained support from former Nazis and from discontented or unemployed youth. After Germany's reunification in 1990, neo-Nazis began to make frequent attacks on foreigners. The most violent neo-Nazis have been gangs of young males.

Neo-Nazi movements have grown in other countries since 1980. In the United States, for example, neo-Nazi ideas are supported by Ku Klux Klan members, by the Nazi Party, and by Aryan Nation and other white-supremacist groups. These individuals and organizations promote racism and anti-Semitism and use violence against minorities. Mary Nolan

N'Djamena, *ehn JAHM uh nuh* (pop. 511,700), is the capital and largest city of Chad. It lies near the southwest border of the country where the Chari and Logone rivers meet. For location, see **Chad** (map).

N'Djamena is a trade and export center for farm products of Chad. The city has little industry, but it has several hotels, a busy market, and an international airport. Most of the city's people live in adobe houses.

French troops captured N'Djamena from black Africans in 1900 and named the town Fort-Lamy. They ruled the city and the rest of Chad until 1960, when Chad became independent. In 1973, the city was renamed N'Djamena. Robert I. Rotberg

Neanderthals, *nee AN duhr thawlz* or *nee AN duhr tahlz,* were prehistoric human beings who lived in parts of Europe, Asia, and Africa from about 130,000 to 35,000 years ago. Many scientists classify Neanderthals as an early subspecies of *Homo sapiens* (wise human being). However, other scientists do not consider Neanderthals to be direct ancestors of modern human beings. The word *Neanderthal* comes from the Neander Valley near Düsseldorf, Germany. The first fossils identified as Neanderthal were found there in 1856. Similar fossils have been found at over 40 sites.

Neanderthals stood about 5 feet 2 inches (157 centimeters) tall and walked fully erect. They had heavy bones, slightly curved limbs, big browridges, and powerful teeth. Their average brain size was larger than that of modern people, but they seem to have relied more on their physical strength than on skillful use of their hands or on inventive use of tools. However, animal bones found with the Neanderthal fossils show that the Neanderthals were successful hunters in the subarctic environments of Europe. They lived in simple temporary shelters when following the animal herds and sometimes also in caves. At least some Neanderthals buried their dead with great care. Karl W. Butzer

See also **Prehistoric people** (Neanderthals; picture).

Near East is a name given to a region that includes a part of Asia from the Mediterranean Sea to the eastern boundary of Iran, plus part of northeastern Africa. The British and French first called this region the Near East because it lay nearer to London and Paris than the Far East lay. Today, this region is usually called the Middle East (see **Middle East**). Michel Le Gall

Nearsightedness, also called *myopia,* is a visual defect that causes blurred distance vision. Except in extreme cases, near vision remains clear. For the eye to form a clear image, the light rays reflected or given off by an object must come together on the *retina,* the light-sensitive tissue lining the back and sides of the eyeball. In most nearsighted people, the eyeball is longer than normal from front to back. As a result, light rays from a distant object meet in front of the retina. When the rays do strike the retina, they form a blurred image.

Studies have shown that people inherit a tendency to develop nearsightedness. But intense close-up visual activity may contribute to the development of the condition. Some babies develop nearsightedness by age 1, but the problem corrects itself as the eyes grow. Research indicates these individuals usually develop the defect again during or after adolescence.

Nearsighted people can wear concave glasses or contact lenses to clear up their distance vision. Concave lenses are thinner in the middle than at the edges. They bend light rays outward so that the rays meet on the retina. See **Eye** (picture: Nearsightedness).

A surgical procedure called *radial keratotomy* can correct nearsightedness. This procedure, developed in the mid-1970's, flattens the *cornea* (clear tissue covering the eyeball) so that light rays passing through it meet on the retina. Laser surgery also can reshape the cornea and correct nearsightedness. However, the long-term results of these surgical procedures are unknown.

David E. Eifrig

Grant Heilman

Rolling farmland covers much of Nebraska, which ranks among the leading states in agricultural production. Nebraska devotes a greater percentage of land to farming than any other state.

Nebraska *The Cornhusker State*

Nebraska is one of the leading farming states in the United States. Yet it was once considered part of the "Great American Desert." The people of Nebraska, with their determined pioneer spirit, made the Nebraska "desert" a land of ranches and farms. They built irrigation systems and practiced scientific farming. Where crops could not be grown, Nebraskans grazed cattle.

Today, farms make up 95 percent of the state's area—a greater percentage than in any other state. In the west, waving fields of golden wheat stretch as far as the eye can see. In north-central Nebraska, huge herds of beef cattle graze on enormous ranches. On the fertile farms of the east, farmers grow corn, soybeans, sorghum grain, and other crops. The farmers there also raise hogs and fatten cattle for market.

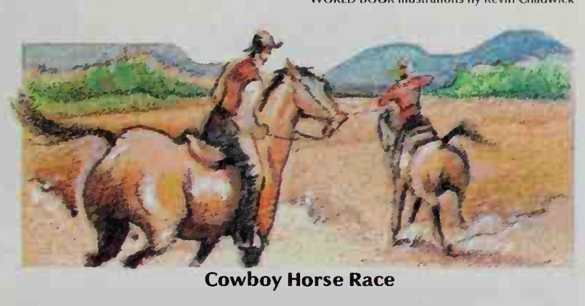
But Nebraska is more than a farming state. Such service industries as finance and insurance play a major role in Nebraska's economy. Omaha is one of the Midwest's leading centers of finance and insurance. Manufacturing, especially food processing, is also important to the state's economy.

Much of the history of Nebraska is the story of the tough, strong-willed Nebraska farmer. Many of the first farm settlers built homes of Nebraska sod because they found few trees on this grassy land. In the 1860's, the first great wave of homesteaders poured into Nebraska to claim free land granted by the federal government. Hard times, insect pests, and droughts discouraged many farmers, and they returned to the East or moved to the mining areas of Colorado and California.

The independent, pioneer spirit of the people of Nebraska also led them to adopt a *unicameral* (one-house) state legislature. Nebraska is the only state in the nation with a unicameral legislature. Lincoln is the capital of Nebraska, and Omaha is the largest city.

The name *Nebraska* comes from the Oto Indian word *nebrathka.* The word means *flat water,* and was the Indian name for Nebraska's chief river, the Platte. Nebraska's official nickname is the *Cornhusker State.* This nickname comes from corn, the state's leading crop, and from the cornhusking contests that were once held each fall in many rural communities.

Gerald R. Ford, the 38th President of the United States; and Malcolm X, a Black Muslim leader, were born in Omaha. Other famous Americans who have lived in Nebraska include political leader William Jennings Bryan; novelist Willa Cather; entertainers Johnny Carson and Henry Fonda; and Edward J. Flanagan, the Roman Catholic priest who founded Boys Town.



The contributors of this article are Donald R. Hickey, Professor of History at Wayne State College; and David Wishart, Professor of Geography at the University of Nebraska.

James Blank, FPG

Omaha's Central Park is a pleasant gathering place for people in the city. The Old Market rises in the background.

Interesting facts about Nebraska

WORLD BOOK illustrations by Kevin Chadwick

Cowboy Horse Race

The Cowboy Horse Race began in Chadron on June 13, 1893. John Berry won the nine-man race to Buffalo Bill's Wild West show in Chicago, almost 1,000 miles (1,600 kilometers) away, in 13 days 16 hours. Berry won a prize of $1,000.

Nebraska has the largest planted forest in the United States. It covers about 22,000 acres (8,900 hectares) and is part of the Nebraska National Forest.

The National Museum of Roller Skating is located in Lincoln. It is the only museum in the world dedicated solely to roller skating, with exhibits on the sport and industry from 1819 to the present.

The largest mammoth fossil ever found was unearthed in 1922 near Wellfleet. Scientists have determined that the mammoth was 13 feet $4\frac{1}{4}$ inches (4.07 meters) tall. The fossil is on display at the University of Nebraska State Museum in Lincoln.

Roller skating museum

Grant Heilman

Beef cattle provide Nebraska's largest source of agricultural income. These ranchers are driving Hereford cattle to winter pasture.

Nebraska in brief

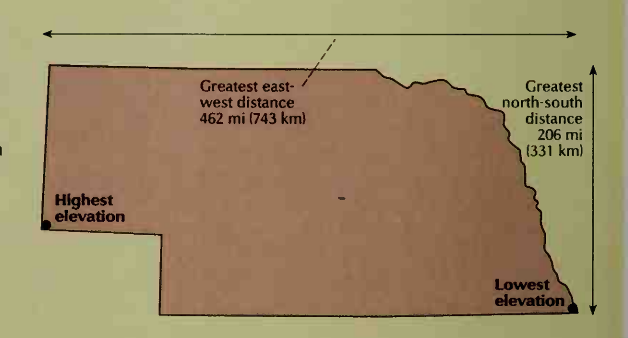
Symbols of Nebraska

The state flag, adopted in 1925, bears the state seal. On the seal, adopted in 1867, a smith with a hammer and anvil stands for the mechanical arts. A settler's cabin, sheaves of wheat, and stalks of growing corn symbolize agriculture. A steamboat on the Missouri River and a train represent forms of transportation that helped speed the settlement of Nebraska. The Rocky Mountains rise in the background.

State flag

State seal

Nebraska (brown) ranks 15th in size among all the states and 3rd in size among the Midwestern States (yellow).



General information

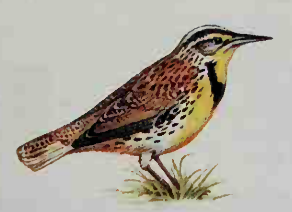
Statehood: March 1, 1867, the 37th state.
State abbreviations: Nebr. or Neb. (traditional); NE (postal).
State motto: *Equality Before the Law.*
State song: "Beautiful Nebraska." Words by Jim Fras and Guy G. Miller; music by Jim Fras.

The State Capitol is in Lincoln, chosen as Nebraska's capital in 1867. The government moved there from Omaha a year later. Omaha was the capital from 1855 to 1868.

Land and climate

Area: 77,359 mi² (200,358 km²), including 481 mi² (1,245 km²) of inland water.
Elevation: *Highest*—5,426 ft (1,654 m) above sea level in southwestern Kimball County. *Lowest*—840 ft (256 m) above sea level in Richardson County.
Record high temperature: 118 °F (48 °C) at Minden on July 24, 1936, at Hartington on July 17, 1936, and at Geneva on July 15, 1934.
Record low temperature: −47 °F (−44 °C) at Camp Clarke, near Northport, on Feb. 12, 1899.
Average July temperature: 76 °F (24 °C).
Average January temperature: 23 °F (−5 °C).
Average yearly precipitation: 22 in (56 cm).

Important dates



1714 Étienne Veniard de Bourgmont traveled up the Missouri River to the mouth of the Platte River.

1803 The United States bought the Louisiana territory, including Nebraska, from France.

1819 The U.S. Army established Fort Atkinson.

1863 One of the first free homesteads was claimed by Daniel Freeman near Beatrice.

Sources of information

For information about tourism, write to: Department of Economic Development, Tourism Division, P.O. Box 98907, Lincoln, NE 68509-8907. The Web site at visitnebraska.org also provides tourism information.

The state's official Web site at www.state.ne.us also provides a gateway to much information on Nebraska's economy, government, and history.

1867 Nebraska became the 37th state on March 1.

1934 Nebraskans voted to adopt a one-house legislature.

1967 Nebraska adopted both a sales and an income tax.

1982 Nebraska adopted Initiative 300, which prohibits corporations from buying farms or ranches in the state.

People

Population. The 2000 United States census reported that Nebraska had 1,711,263 people. The population had increased about 8 ½ percent over the 1990 figure, 1,578,385. According to the 2000 census, Nebraska ranks 38th in population among the 50 states.

About half of Nebraska's population live in the state's metropolitan areas (see **Metropolitan area**). The areas are Lincoln; Omaha, which extends into Iowa; and Sioux City, Iowa, which extends into Nebraska. For the populations of these areas, see the *Index* to the political map of Nebraska.

Omaha, the state's largest city, serves as the industrial and trade center of eastern Nebraska and western Iowa. Omaha is one of the nation's chief rail centers. Lincoln, the state's second largest city, is an educational, governmental, and retail shopping center. Bellevue, the state's third largest city, is a fast-growing suburb of Omaha. Grand Island is Nebraska's fourth largest city. It serves as an important manufacturing, food processing, and distribution center. Only 12 other Nebraska cities have more than 10,000 people.

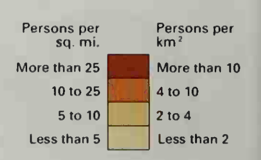
During the early history of Nebraska, Germans were the main immigrant group. They accounted for about 15 percent of the state's population in 1900. Today Nebraska's largest population groups include people of German, Irish, English, Czech, and Mexican descent.

Schools. In the 1820's, the U.S. Army established Nebraska's first school, at Fort Atkinson (near present-day Fort Calhoun). During the 1830's and 1840's, missionaries of various religious faiths founded schools in eastern Nebraska to teach the Indians. The first legislature of the Nebraska Territory adopted a free-school law in 1855, one year after the territory was established. The state Constitution, adopted in 1875, provides for the present system of public education. Children must attend school from age 7 through 15.

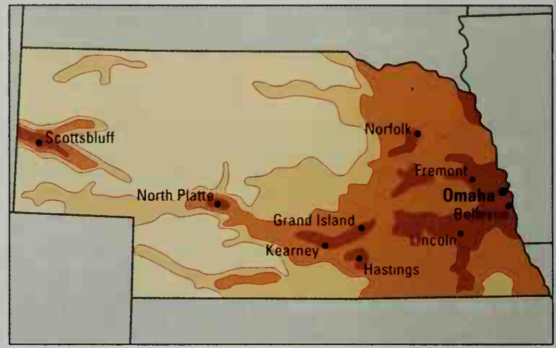
The Department of Education supervises and administers the state's school system. The department consists of a State Board of Education and a state commissioner of education. The people elect the eight members of the State Board of Education to four-year terms. The members of the board appoint the commissioner. For the number of students and teachers in Nebraska, see **Education** (table).

Libraries. Nebraska's first library was established in 1820 at the Fort Atkinson military post. The Kansas-Nebraska Act of 1854 provided for a territorial library in Nebraska. This library later became the state law library.

In 1871, Omaha established the state's first public library. The Legislature passed a law in 1877 providing state funds to support public libraries. The Nebraska Library Commission was set up in 1901. The commission promotes, develops, and coordinates library services in the state. Nebraska has about 250 public libraries.



The University of Nebraska-Lincoln Library has over 2 ½ million volumes. It also houses special collections on American folklore and author Willa Cather. The Nebraska State Historical Society Library in Lincoln collects books and documents on the history of the region. Some other significant libraries include the Lincoln City Library in Lincoln, and the Creighton University and University of Nebraska libraries in Omaha.



Museums. The Joslyn Art Museum in Omaha has collections ranging from ancient to modern art. Among its displays are objects crafted by American Indians and examples of art from Western frontier days. The University of Nebraska's Sheldon Memorial Art Gallery in Lincoln displays modern American paintings and sculptures.

The University of Nebraska State Museum in Lincoln has one of the largest collections of fossils in the United States. Its exhibits include an exceptional display of prehistoric mammoth skeletons. The Nebraska State Historical Society maintains a Museum of Nebraska History in Lincoln and seven other museums, including the Fort Robinson Museum in Crawford, the George Norris Home in McCook, and the Willa Cather Historical Center in Red Cloud. The Strategic Air Command (SAC) Museum near Omaha has displays and shows about SAC. For information on other museums, see the *Places to visit* section of this article.

Population density

About half of the people of Nebraska live in metropolitan areas. Eastern Nebraska includes the state's largest cities—Omaha and Lincoln—and is much more heavily populated than the west.

WORLD BOOK map; based on U.S. Census Bureau data.

Every year, thousands of tourists drive along Nebraska highways that follow the historic Oregon and Mormon trails. Ruts left by the pioneers' covered wagons can still be seen along the roadsides. In western Nebraska, the forests and rugged rocks of the Pine Ridge are a camper's, bicyclist's, and hiker's paradise. Other scenic spots include the valleys of the Platte, Niobrara, Big Blue, Loup, and Republican rivers and the bluffs along the Missouri River. The lakes and streams of the Sand Hills area teem with fish. On the prairies, hunters bag pheasants, quail, and other birds as well as deer.

The Nebraska State Fair and the Nebraskaland Days and Buffalo Bill Rodeo are the state's most important annual events. The fair is held in Lincoln from late August to early September. It features exhibits of crops, farm machinery, household equipment, and livestock. Nebraskaland Days takes place in North Platte in June. It includes parades, old-time Wild West shows, and a rodeo. Almost every county has a fair during the summer, and many communities hold annual fall festivals.

Places to visit

Following are brief descriptions of some of Nebraska's many interesting places to visit:

Arbor Lodge, in Nebraska City, was the 52-room mansion of Julius Sterling Morton, a Nebraska journalist and the founder of Arbor Day. The site has 250 species of trees and shrubs.

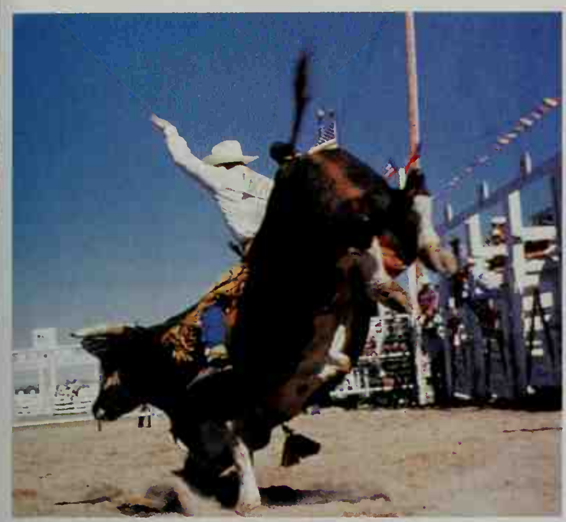
Bellevue is the oldest town in Nebraska. It was established about 1823 as a fur-trading center. Some of the town's buildings are more than 100 years old.

Brownville was a leading river port of the 1850's. Many colorful reminders of pioneer days still stand.

Girls and Boys Town, near Omaha, is a home for neglected and homeless children of all races and creeds.

Great Platte River Road Archway Monument, a museum near Kearney, spans Interstate 80 and features exhibits on the road's history and development of the West.

Harold Warp's Pioneer Village in Minden has an extensive collection of memorabilia from pioneer days.



Museum of the Fur Trade, near Chadron, has a large collection of Indian artifacts, early guns, and other fur trade relics.

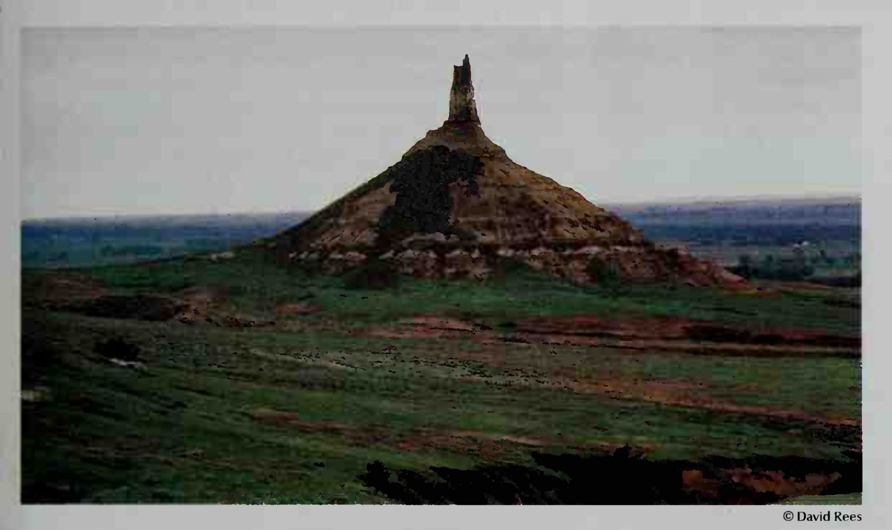
Scouts Rest Ranch, near North Platte, was the home of Buffalo Bill, the famous scout and showman. His popular Wild West show rehearsed there.

Stuhr Museum of the Prairie Pioneer, near Grand Island, features a restored railroad town of the 1800's. A bank, general store, and post office are among 60 frontier buildings there.

National forests and parklands. Nebraska has two national forests, Nebraska in Blaine, Dawes, Sioux, and Thomas counties and McKelvie in Cherry County. The division of Nebraska National Forest that lies in Blaine and Thomas counties is the largest hand-planted forest in the United States. The Agate Fossil Beds National Monument in northwestern Nebraska contains deposits of animal fossils. The Homestead National Monument of America, near Beatrice, occupies the site of one of the first pieces of land claimed under the Homestead Act of 1862. The Scotts Bluff National Monument marks a landmark 800 feet (244 meters) above the North Platte River on the Oregon Trail. The spire at Chimney Rock National Historic Site rises about 500 feet (150 meters) above the North Platte.

State parks. Nebraska has eight state parks. For information on them, write to Director, Game and Parks Commission, Box 30370, Lincoln, NE 68509.

Jim Holm, Nebraska Department of Economic Development



Nebraska's Big Rodeo in Burwell

Annual events

January-May
Sandhill Crane Migration in Grand Island, Hastings, and Kearney (March); St. Patrick's Day Celebration in O'Neill (March); Arbor Day, statewide (April); Willa Cather Spring Conference in Red Cloud (May).

July-August
Grundlovs Fest, or Danish Day, in Dannebrog (June); Swedish Festival in Stromsburg (June); North Platte Nightly Rodeo (June-July); Old Mill Days in Neligh (July); Oregon Trail Days in Gering (July); State Fourth of July Celebration in Seward (July); Fur Trade Days in Chadron (July); Wayne Chicken Show (July); Winnebago Pow Wow in Winnebago (late July); Czech Festival in Wilber (August); Nebraska's Big Rodeo in Burwell (August); Omaha Pow Wow in Macy (August); John C. Fremont Days in Fremont (August).

September-December
Husker Harvest Days in Grand Island (September); Cowboy Poetry Gathering in Valentine (September); River City Roundup in Omaha (September); Oktoberfest in Sidney (October); Light of the World Pageant in Minden (December); Star City Holiday Weekend in Lincoln (December).

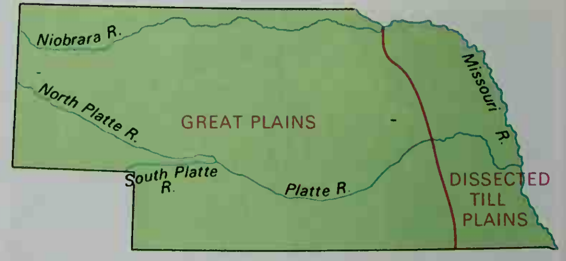
Land and climate

The Sand Hills of west-central Nebraska are low hills and ridges consisting of fine sand piled up by the wind. Grasses that cover the Sand Hills keep most of the sand in place.

© David Rees

Land regions. Nebraska rises in a series of rolling plateaus from the southeast to the extreme southwest. The land rises from about 800 feet (240 meters) above sea level to over 5,400 feet (1,650 meters). Nebraska has two major land regions. These are, from east to west: (1) the Dissected Till Plains and (2) the Great Plains.

The Dissected Till Plains cover about the eastern fifth of Nebraska and extend into South Dakota, Iowa, Missouri, and Kansas. Glaciers once covered the Till Plains. The last glacier melted several hundred thousand years ago. It left a thick cover of rich, soil-forming material called *till.* A deep deposit of windblown dust called *loess* then settled on the till. Streams have *dissected* (cut up) the region, giving it a rolling surface. In the southeastern section of Nebraska's Till Plains, the action of the streams has exposed glacial materials on the sides of the valleys. The northern section of the Till Plains is known as the Loess Hills. Most of the Dissected Till Plains region is very well suited to farming with modern machinery.



The Great Plains region of Nebraska stretches westward from the Dissected Till Plains and extends into Wyoming and Colorado. A series of sand hills rises north of the Platte River in the central part of the region. The soil of the Sand Hills section consists of fine sand piled up by the wind. The sand was formed into low hills and ridges. The section covers about 20,000 square miles (51,800 square kilometers), making it the largest area of sand dunes in North America. Grasses that now cover the Sand Hills hold most of the sand in place. Sometimes, however, overgrazing by cattle and extension of irrigated cropland kill the grass cover. The wind then cuts great holes called *blowouts* into the hillsides. Most ranchers take care not to overgraze the land. The Sand Hills make fine cattle country because of the area's flowing streams, abundant well water, and excellent grasses. Some of the grass is cut as *wild hay.*

The soil of the Sand Hills acts like a giant sponge. It absorbs and holds most of the area's limited rainfall. The rainfall seeps down and creates vast underground reservoirs of *ground water.* Movement of the ground water makes it possible to pump irrigation water to the surface in areas around the Sand Hills.

A deep deposit of loess covers the central and south-central parts of the Great Plains. Some of this loess country is rough and hilly. But in the southeast, a flat loess area covers about 7,000 square miles (18,000 square kilometers). This area, called the Loess Plain, is farmed even more intensively than the Till Plains.

North and west of the Sand Hills are the High Plains, which cover about 12,000 square miles (31,100 square kilometers). The High Plains in the west rise over 1 mile (1.6 kilometers) above sea level along part of the Wyoming border. The High Plains receive little rainfall. Farmers there must use irrigation or practice *dryland farm-*

ing, methods that make the most of the limited rainfall (see **Dry farming**). Rough parts of the High Plains are used mainly to graze cattle. Some of the rough areas, including the beautiful Wildcat Ridge and Pine Ridge, are covered with evergreen trees. The highest point in Nebraska is 5,426 feet (1,654 meters) above sea level in southwestern Kimball County.

A small area of Badlands is found in northwestern Nebraska. There, the forces of nature have carved weird formations in the sandstone and claylike rocks. The Badlands have little economic importance, but ranchers use some of the area to graze cattle, and tourists marvel at the magnificent scenery.

Rivers and lakes. The great Missouri River forms Nebraska's eastern and northeastern border. Nebraska's principal river, the Platte, flows into the Missouri at Plattsmouth. The North Platte and South Platte rivers join near the city of North Platte and form the Platte. The North Platte River enters the state from Wyoming, and the South Platte enters from Colorado. The Platte River winds across central and southern Nebraska. In some places, it is as much as 1 mile (1.6 kilometers) wide. The Platte is too shallow for navigation. Nebraskans use the waters of the river and its branches for irrigation, recreation, and the production of hydroelectric power.

The Loup and Elkhorn rivers are the Platte's most important branches. Both rise in the Sand Hills. The abundant supplies of ground water in the Sand Hills keep these rivers flowing the year around. The Loup is formed by the North, Middle, and South Loup rivers.

The Republican River enters southwestern Nebraska from Kansas. It flows near the southern edge of Nebraska for about 200 miles (320 kilometers), and then turns back into Kansas and empties into the Kansas River. Other branches of the Kansas River in Nebraska include the Big Blue and Little Blue rivers. These three branches of the Kansas River usually flow gently. But heavy rainstorms sometimes cause them to overflow and flood the countryside. This danger has been reduced by flood-control projects and by dams built for irrigation and generating electric power.

The Niobrara River flows into northwestern Nebraska from Wyoming. It winds across the northern part of the state. This narrow, swift river passes through many

Nebraska Department of Economic Development

Pine Ridge is a beautiful, rugged area that forms part of the High Plains in northwestern Nebraska.

Nebraska has hot summers with temperatures varying only slightly. The far west is cooler than the rest of the state.

Average yearly precipitation

Nebraska may have wide ranges of precipitation from year to year. Rainfall decreases steadily from east to west.

WORLD BOOK maps

scenic spots. It joins the Missouri River in Knox County.

Nebraska has more than 2,000 lakes. None of the natural lakes is very large. Hundreds of small, shallow lakes dot the Sand Hills. Lake McConaughy, Nebraska's largest lake, is artificially created. It covers about 55 square miles (142 square kilometers) and has a shoreline of 105 miles (169 kilometers). Lake McConaughy was formed on the North Platte River by Kingsley Dam.

Other important artificially created lakes on the Platte River irrigation and power system include Jeffrey and Sutherland reservoirs and Johnson Lake. Additional large artificially created lakes in Nebraska are Swanson Lake and Harlan County Lake on the Republican River, and Enders Reservoir and Harry Strunk Lake on branches of the Republican River.

Plant and animal life. Forests cover only about 2 percent of Nebraska. Common trees in eastern and central Nebraska include ashes, basswoods, boxelders, cottonwoods, elms, hackberries, locusts, oaks, walnuts, and willows. Pines and cedars are among the trees that grow in the western part of the state.

Tall prairie grasses, especially bluestem, grow in uncultivated parts of eastern Nebraska. Short grasses, such as grama and buffalo grass, cover the land in drier western regions. Eastern shrubs include wild plums and chokecherries. Evening primroses, phloxes, and violets bloom in the eastern regions in spring. During the summer, blue flags, columbines, larkspurs, poppies, spiderworts, and wild roses thrive throughout the state. Goldenrod and sunflowers brighten roadsides and fields in late summer.

Nebraska's animal life consists chiefly of mule deer and such small animals as badgers, coyotes, muskrats, opossums, prairie dogs, rabbits, raccoons, skunks, and squirrels. Game birds are plentiful in the state. They include ducks, geese, pheasants, and quail. Common fish in the state's waters include bass, carp, catfish, crappies, perch, pike, and trout.

Climate. Nebraska's climate ranges from extremely hot in summer to extremely cold in winter. The weather changes suddenly—and sometimes violently. Hot, moist breezes from the Gulf of Mexico occasionally make summer nights uncomfortably warm in eastern areas. Nebraska sometimes has violent thunderstorms, tornadoes, blizzards, and hailstorms.

Temperatures in Nebraska vary only moderately from one area to another. Temperatures average about 76 °F (24 °C) in July and about 23 °F (−5 °C) in January. The state's record high temperature of 118 °F (48 °C) was set at Geneva on July 15, 1934; at Hartington on July 17, 1936; and at Minden on July 24, 1936. Camp Clarke, near Northport, recorded the lowest temperature, −47 °F (−44 °C), on Feb. 12, 1899.

Rainfall decreases steadily from east to west. The east receives about 27 inches (69 centimeters) of rain yearly. Less than 18 inches (46 centimeters) fall in the west. The state has droughts in some years, floods in others. Most rain falls from April to September. The growing season ranges from about 165 days in the southeast to 120 days in the northwest. Snowfall averages almost 30 inches (76 centimeters) yearly in the east. The west generally has less snow.

Economy

Nebraska is one of the leading agricultural states. Farms and ranches take up about 95 percent of the land—a higher percentage than in any other state. However, service industries, taken together, make up the largest part of Nebraska's *gross state product*—the total value of goods and services produced within a state in a year. Services and manufacturing benefit from the state's strong agricultural base. For example, the transport of agricultural goods by truck and rail contributes to the service sector, and processed foods are the leading manufactured product.

Production and workers by economic activities

Economic activities	Percent of GSP* produced	Employed workers: Number of people	Employed workers: Percent of total
Community, business, & personal services	19	323,900	28
Wholesale & retail trade	17	251,700	22
Finance, insurance, & real estate	15	85,100	7
Government	14	160,800	14
Manufacturing	13	121,900	11
Transportation, communication, & utilities	11	62,700	6
Agriculture	6	83,200	7
Construction	5	59,900	5
Mining	†	2,100	†
Total	100	1,151,300	100

*GSP = gross state product, the total value of goods and services produced in a year.
†Less than one-half of 1 percent.
Figures are for 1998.
Sources: *World Book* estimates based on data from U.S. Bureau of Economic Analysis and U.S. Bureau of Labor Statistics.

Natural resources. Soil and water are Nebraska's most precious natural resources, and they are carefully conserved. Farmers rotate their crops, and some practice terracing and other soil-saving methods to keep the soil from wearing out or washing away. Many dams have been built to provide water for livestock and irrigation. The dams are also used to help control the flow of rivers and to produce electric power.

Nebraska may have more underground water than any other state. It lies above the High Plains Aquifer, a layer of porous rock and other material filled with water. This huge underground "lake" spreads from Texas to South Dakota, with two-thirds of it beneath Nebraska.

Soil. A fertile silt loam covers eastern Nebraska. The soil of the Sand Hills, in central Nebraska, consists of loose sand. It drifts badly if plowed, but left untouched, it supports grasses on which cattle can graze. The High Plains in the west have a loamy soil.

Minerals. Nebraska has few minerals. Fields of petroleum and natural gas lie chiefly in western and south-central Nebraska. Sand and gravel can be found along the Platte and Republican rivers and their branches. Limestone quarries lie along the Missouri River in the

southeast part of the state. Clay deposits are found throughout the state.

Service industries account for the largest portion of the gross state product of Nebraska. Many of the state's service industries are located in the Omaha and Lincoln metropolitan areas.

Community, business, and personal services make up Nebraska's leading service industry group. This industry group consists of a variety of economic activities, including private health care, data processing companies, engineering companies, law firms, and repair shops. Omaha is a national center for telemarketing companies, which service businesses by promoting and selling products by telephone.

Wholesale and retail trade ranks second in terms of its contribution to the gross state product. Wholesale trade consists of buying goods from producers and selling them to other businesses. The state's major wholesale goods include farm products and farm supplies. ConAgra, a major distributor of food products, is based in Omaha. Retail trade involves selling goods directly to consumers. Major retail businesses in Nebraska include automobile dealerships and grocery stores.

Finance, insurance, and real estate is Nebraska's third-leading service industry. Omaha is a Midwestern financial center. Mutual of Omaha, one of the largest insurance companies in the United States, is headquartered in the city. Omaha is also the home of Berkshire Hathaway, a large holding company of insurance companies and other businesses. The buying and selling of houses, farms, and other property make real estate an important activity in many parts of the state.

Ranking next among the service industries are government services and transportation, communication, and utilities. Government services include the operation of electric utilities, public schools, public hospitals, military bases, and Indian reservations. Nebraska is the only state in which publicly owned utilities provide all electric service. The public school system is a major employer in the state. The headquarters of the U.S. Strategic Command (STRATCOM) is at Offutt Air Force Base, near Omaha. In a nuclear war, STRATCOM would control all U.S. long-range bombers and missiles, as well as all U.S. ballistic missile submarine forces.

Mutual of Omaha Insurance Company

The Mutual of Omaha Building, *center,* is the home of one of the largest U.S. insurance companies. The city ranks as one of the nation's centers of the insurance industry.

Railroad, shipping, and trucking companies are an important part of the transportation, communication, and utilities sector. These companies transport agricultural goods from farms to markets. Telephone companies are the most important part of the communications sector. Utilities provide gas and water service. More information about transportation and communication can be found later in this section.

Manufacturing. Goods manufactured in Nebraska have a *value added by manufacture* of about $11 billion yearly. Value added by manufacture represents the increase in value of raw materials after they become finished products.

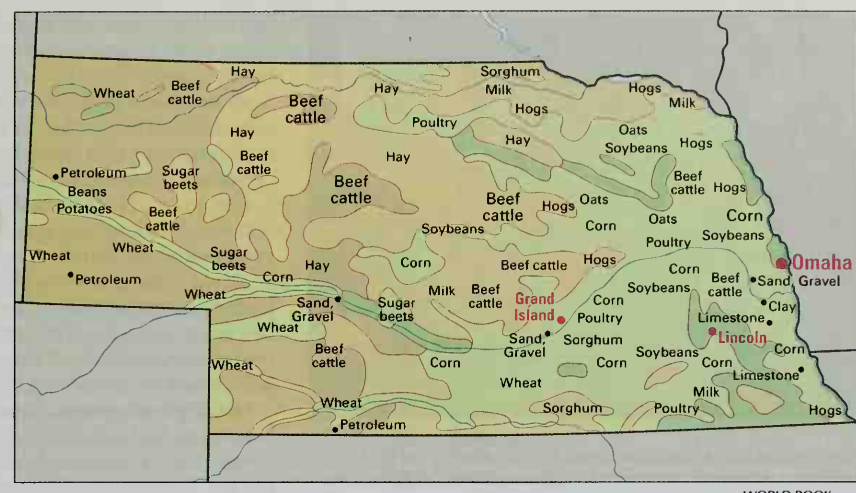
Food processing is by far the leading manufacturing activity in Nebraska in terms of value added by manufacture. Meat products and grain products provide most of the income from food processing in Nebraska. The state is one of the world's major centers of meat packing. Dakota City, Fremont, Grand Island, Lexington, Omaha, and Schuyler have large meat-packing plants. The Omaha area is also the state's chief center for the processing of grain products. Breakfast cereal and livestock feed are the leading grain products. Other food products include baked goods, dairy products, and soft drinks.

Chemicals are Nebraska's second-leading manufacture. Nebraska's leading chemical products include pharmaceuticals, pesticides, and fertilizers.

Machinery ranks third among manufactured goods. The most important kind of machinery is farm equipment. Plants in Gering, Grand Island, and many other places manufacture farm equipment. Instruments and related products rank fourth among Nebraska's manufactured products. Scientific, medical, and surgical instruments are among the leading instruments produced. Other products manufactured in Nebraska, in order of value added, include electrical equipment, fabricated metal products, and transportation equipment.

Agriculture. Nebraska has about 55,000 farms. The leading farm products are beef cattle, corn, hogs, and soybeans. Nebraska ranks among the leading producers of all four of these products. The state has many irrigated farms, especially in the central region.

Nebraska's largest farms are the cattle ranches of the Sand Hills area, some of which cover up to 100,000 acres (40,000 hectares). The smallest farms are in the eastern and south-central sections of the state. They produce livestock, corn, wheat, oats and other field crops.



Livestock and livestock products provide about two-thirds of Nebraska's farm income. Beef cattle are the most important farm product in the state. The rich grasses that grow on the Sand Hills and in the west provide fine feed for range beef cattle. Ranchers ship calves to farmers in the eastern corn-raising areas. These farmers, called *feeders,* fatten the young cattle on corn and other grains. After fattening, the cattle are sent to livestock markets. Nebraska is one of the leading states in fattening cattle for market. Some farmers raise dairy cattle, and milk is another important source of farm income.

Hogs are the second most important livestock product in Nebraska. The Till Plains region of eastern Nebraska is one of the country's leading hog-producing areas.

Economy of Nebraska

This map shows the economic uses of land in Nebraska and where the state's leading farm and mineral products are produced. Major manufacturing centers are shown in red.

- Mostly cropland
- Woodland mixed with cropland
- Grazing land mixed with cropland
- Mostly grazing land
- Manufacturing center
- Mineral deposit

WORLD BOOK map

Egg farms are also found in this region.

Crops provide about a third of Nebraska's farm income. Corn, the state's chief crop, is grown in the east and in irrigated areas. Much of the corn is used to feed cattle and hogs. The state's other leading crops are soybeans, hay, grain sorghum, and wheat. Most of the soybean farms lie in the Till Plains region. Most of the hay is grown in the Great Plains region, especially the northern section. Southeastern Nebraska produces most of the grain sorghum. Most of Nebraska's wheat farms lie near the state's southern border. Other crops raised in Nebraska include barley, beans, sugar beets, oats, and potatoes.

Mining. More than a third of Nebraska's mining income comes from petroleum. Most of the state's crude oil is produced in Cheyenne, Hitchcock, Kimball, and Red Willow counties. Construction companies use sand and gravel from the Platte Valley. Manufacturers use clay from eastern Nebraska for bricks, tiles, and pottery. The state's limestone is used in construction, in making cement, and in treating soil.

Electric power. Power plants that burn coal provide about 65 percent of the electric power generated in Nebraska. Nuclear plants at Brownville and Fort Calhoun supply approximately 30 percent of the state's power. Most of the remaining power comes from hydroelectric plants.

Transportation. Thousands of pioneers crossed the Nebraska region on their way to the West. The Oregon, California, and Mormon trails followed Nebraska's Platte River. In 1865, the Union Pacific Railroad began laying track westward from Omaha and became part of the first transcontinental rail system in the United States. Today, the Union Pacific and the Burlington Northern Santa Fe railroads provide most of the freight service in Nebraska. Passenger trains serve five cities.

Nebraska has about 93,000 miles (150,000 kilometers) of roads and highways. All highways and most roads are surfaced. Interstate 80 is the most important highway. It runs east and west between Omaha and the Wyoming border.

Nebraska's busiest airport is at Omaha. Lincoln also has a large airport. Ports in Omaha, Nebraska City, and South Sioux City send and receive freight by water.

Communication. D. E. Reed began Nebraska's first newspaper, the *Nebraska Palladium and Platte Valley Advocate,* in 1854. Today, Nebraska has about 190 newspapers, of which about 15 are dailies. The state's leading daily newspaper is the *Omaha World-Herald.* Other Nebraska dailies with large circulations include the *Lincoln Journal Star,* the *Grand Island Independent,* and the *Norfolk Daily News.* Nebraska publishers also issue about 50 periodicals.

Nebraska has about 115 radio stations and 25 TV stations. Cable television systems and Internet providers service many communities throughout the state. Nebraska Wesleyan University established Nebraska's first radio station, WCAJ, in Lincoln in 1921. The first commercial station, WOAW (now WOW), began broadcasting from Omaha in 1923. The state's first television stations, KMTV and WOW-TV, started operations in Omaha in 1949.

Government

Constitution of Nebraska was adopted in 1875. Nebraska had one earlier constitution, adopted in 1866. Amendments may be proposed by the Legislature, by a constitutional convention, or by the people. An amendment proposed in the Legislature becomes law after approval by three-fifths of the Legislature and by a majority of voters casting ballots on the amendment, providing that these approving votes are no less than 35 percent of the total votes cast in the election.

A proposal to call a constitutional convention also must be approved by three-fifths of the Legislature and by a majority of voters casting ballots on the proposal, providing that these approving votes are no less than 35 percent of the total votes cast in the election. Convention proposals become law after they have been approved by a majority of people voting on them. The

The Nebraska Legislature meets in the State Capitol in Lincoln. Nebraska is the only state with a *unicameral* (one-house) legislature. Its 49 members are called *senators*.

people of Nebraska may sign a *petition* (formal request) proposing a constitutional amendment. The number of signatures on a petition must equal at least 10 percent of the number of registered voters on the date the signatures are to be turned in to the secretary of state. The proposed amendment becomes law after approval by a majority of voters casting ballots on the amendment, providing that these votes are no less than 35 percent of the total votes cast in the election. The people also have the power of referendum, which may be invoked, by petition, against acts of the Legislature.

Executive. Voters elect the governor, lieutenant governor, secretary of state, attorney general, treasurer, and auditor to four-year terms. The governor and treasurer may serve no more than two terms in succession. The other four officials have no term limits. Voters have elected the six top officials to four-year terms since 1966. Before then, they were elected to two-year terms.

Legislature. Nebraska is the only state with a *unicameral* (one-house) legislature. The 49 members of the Legislature are called *senators*. Voters in each of 49 legislative districts elect one senator. The people elect the senators on a *nonpartisan* ballot—that is, the ballot has no political party labels. Nebraska is the only state that chooses state legislators in nonpartisan elections.

The people approved a constitutional amendment in 1962 increasing the legislators' terms from two years to four years. In the 1964 general election, 24 senators were elected to two-year terms and 25 senators were elected to four-year terms. Since 1966, half the senators have been elected every two years to four-year terms.

The Legislature meets every year. Regular sessions begin on the Wednesday after the first Monday in January. They are limited to 60 days in even-numbered years and 90 days in odd-numbered years. The governor may call special sessions.

Courts in Nebraska are headed by the state Supreme Court. It consists of a chief justice and one judge from each of the six judicial districts. The Court of Appeals has six judges, each representing one of the six judicial districts. Nebraska also has 12 district courts, with a total of 54 judges. A merit plan for selecting Supreme Court, appellate court, and district court judges went into effect in 1964. Under the plan, the governor appoints a judge to fill a vacancy in these courts from a list submitted by a nominating committee. Each judge appointed must be approved by the voters at the next general election after holding office for three years. If approved, he or she serves in the office for six more years. Thereafter, the voters must approve the judge every six years.

There are 12 districts in Nebraska's county court system and 59 county judges. The state's three most populated counties—Douglas, Lancaster, and Sarpy—have separate juvenile courts. There are nine juvenile court judges, who are selected and retained in the same manner as are judges of the state's Supreme Court and district courts. No political party labels are allowed on the ballot used for approving judges.

Local government. Nebraska has 93 counties. About two-thirds of the counties have the commissioner-precinct form of government, and the remainder have the supervisor-township form. Counties that have the commissioner-precinct form are governed by a board of commissioners of three or five members. The commissioners are elected to four-year terms. Counties with the supervisor-township form are governed by a seven-member board of supervisors. The supervisors are also elected to four-year terms. Other officials in both kinds of Nebraska counties include the county clerk, treas-

Mike Johanns	Republican	1999-

urer, sheriff, and attorney. Commissioners, supervisors, and all other elected county officials may serve any number of terms.

Nebraska has over 500 cities and villages. Most cities have the mayor-council form of government. Nebraska City uses the commission form, and a few cities use the council-manager plan. Most villages are governed by a five-member board of trustees. The Constitution gives *home rule* to cities with over 5,000 people. Such cities may operate under their own charters. Only Lincoln and Omaha have chosen to adopt their own charters.

Revenue. Taxes provide more than half of the state government's *general revenue* (income). Most of the rest comes from federal grants and other U.S. government programs. The largest sources of state tax revenue are a general sales tax and a personal income tax. Other important tax revenue sources include taxes on motor fuels, corporate income, motor vehicle licenses, insurance, and tobacco products.

Politics. All members of the Legislature, all judges and school officials, and many local officials are elected or approved on nonpartisan ballots. This system has weakened party politics in the state. However, in about three-fourths of the elections for president and two-thirds of the elections for governor, most Nebraskans have voted for Republicans. For Nebraska's electoral votes and voting record in presidential elections, see **Electoral College** (table).

Two of Nebraska's most famous citizens were national political leaders. William Jennings Bryan ran for president unsuccessfully three times. George W. Norris won fame as an independent politician during his 40 years in the United States House of Representatives and the United States Senate.

History

Indian days. A prehistoric people probably lived in the Nebraska region between 10,000 and 25,000 years ago. Scientists base this belief on the discovery of tips of stone tools and weapons, which were found buried in the Nebraska earth.

During the 1700's, European explorers came across several Indian tribes in the Nebraska region. The Missouri, Omaha, Oto, and Ponca Indians lived peacefully, farming, hunting, and fishing along the rivers. The Pawnee hunted buffalo and grew corn, beans, and squash. They fought fiercely with other tribes, especially with the Sioux who lived to the north and the Comanche to the south. But the Pawnee were friendly with white settlers, and Pawnee scouts helped the U.S. Army in wars against the Sioux and Cheyenne. The Arapaho, Cheyenne, Comanche, and Sioux hunted in western Nebraska. They moved from place to place in search of game. To keep their hunting grounds, some Arapaho, Cheyenne, and Sioux resisted the white settlers.

Other Indian tribes moved into the Nebraska region as whites drove them from their homes in the East. The last Indians to settle in Nebraska were the Winnebago, who originally lived in Wisconsin. White people drove the Winnebago first to Iowa and then to Minnesota and South Dakota. In 1863 and 1864, the Winnebago fled into what later became Thurston County. The Omaha, Winnebago, and Santee Sioux now live on reservations in the state. The Pawnee, Oto, and Missouri Indians were forced from Nebraska in the 1870's and 1880's and migrated to what is now Oklahoma.

Exploration. In 1541, Francisco Vásquez de Coronado, a Spanish explorer, led an expedition across the American Southwest and into present-day Kansas. Spain claimed all this territory, including Nebraska, though the Spaniards made no settlements.

In 1682, the French explorer Robert Cavelier, Sieur de La Salle, traveled down the Mississippi River to its mouth. He claimed for France all the land drained by the Mississippi and its branches. La Salle named this vast territory, which included Nebraska, *Louisiana,* after the French king, Louis XIV. French traders and trappers moved into the Louisiana region during the 1690's and early 1700's. In 1714, a French explorer and adventurer, Étienne Veniard de Bourgmont, traveled up the Missouri River to the mouth of the Platte River.

Spain objected to French explorers in regions that it claimed, and decided to remove the French. In 1720, a Spanish expedition under Pedro de Villasur marched from Santa Fe into the Nebraska region. But the expedition met a group of Pawnee Indians along the Platte River and withdrew after being badly defeated.

Two French explorers, the brothers Pierre and Paul Mallet, traveled from French forts in Illinois to Santa Fe in 1739. They were probably the first whites to cross what is now the state of Nebraska.

The Louisiana Purchase. In 1762, France gave Louisiana to Spain. But French fur traders and trappers continued to operate in the Nebraska region, and the Spaniards never set up an effective government. In 1800, Napoleon Bonaparte, the ruler of France, forced Spain to return Louisiana to France. In 1803, he sold the Louisiana Territory to the United States. Nebraska, as part of the Louisiana Purchase, became part of the United States (see **Louisiana Purchase**).

American exploration and settlement. In 1804, President Thomas Jefferson sent an expedition under Meriwether Lewis and William Clark to explore the Louisiana Territory. Lewis and Clark traveled up the Missouri River and explored the eastern edge of Nebraska. Another American explorer, Zebulon M. Pike, visited the south-central part of Nebraska in 1806. Manuel Lisa, a Spanish-American trader, established fur-trading posts along the Missouri River between 1807 and 1820. One of these posts was Fort Lisa, about 10 miles (16 kilometers) north of present-day Omaha.

In 1812, Robert Stuart, a fur agent, set out for New York City from the Astoria fur-trading post in Oregon. Stuart and his party spent the winter in Wyoming and entered Nebraska early in 1813. They traveled along the North Platte and Platte rivers, and reached the Missouri River in April. Settlers moving to Oregon during the next 50 years followed the route explored by Stuart. This route became known as the Oregon Trail.

The U.S. Army established Fort Atkinson in 1819 on the Missouri River, about 16 miles (26 kilometers) north of present-day Omaha. The fort became the site of Ne-

braska's first school, library, sawmill, grist mill, and brickyard. The fort was abandoned in 1827.

In 1820, Major Stephen H. Long led an Army expedition across Nebraska through the Platte and North Platte river valleys. Long described the region of western Nebraska as "almost wholly unfit for farming." He called it the "Great American Desert."

During the 1820's, the American Fur Company and other fur companies set up trading posts at Bellevue and other points along the Missouri River. But until 1854, when Nebraska was made a territory, the federal government maintained Nebraska as Indian country. Except for Indian agents, missionaries, and licensed traders, no white families were allowed to settle there. In 1843, hundreds of pioneers began the "Great Migration" to the rich farmlands of Oregon. They followed the Oregon Trail through Nebraska to the West.

Territorial days. In 1854, Congress passed the Kansas-Nebraska Act, which created the territories of Kansas and Nebraska and opened the region to white settlement. Earlier bills to create the territories had been defeated because Congress could not agree on the slavery question. Northerners wanted to forbid slavery in all new territories, but Southerners wanted to permit it. The Kansas-Nebraska Act provided that the people of the new territories could decide for themselves whether to permit slavery. Most Nebraskans opposed slavery. See **Kansas-Nebraska Act**.

The Nebraska Territory included what is now Nebraska and parts of Montana, North Dakota, South Dakota, Wyoming, and Colorado. President Franklin Pierce appointed Francis Burt of South Carolina as the first territorial governor. Burt died shortly after he took office, and the territorial secretary, Thomas B. Cuming, became acting governor. Cuming organized the territorial government and took a census so that elections could be held for the legislature. Nebraska had a population of 2,732 in 1854. By 1863, Congress had created several new territories from the region, and the Nebraska Territory was reduced to about the state's present area.

Many early settlers in the Nebraska Territory built their homes of sod because so few trees grew on the prairies. This sod was known as "Nebraska marble." Pioneers cut out blocks of sod with spades and piled the blocks on top of one another to form walls. Most roofs consisted of sod blocks supported by a mat of branches, brush, and long grasses.

Statehood. By 1860, Nebraska's population had grown to 28,841. In 1862, Congress passed the first Homestead Act. This act granted 160 acres (65 hectares) of free land in the West to settlers. A great rush for land followed. One of the first homesteads was claimed by Daniel Freeman in 1863 near the present city of Beatrice. The 1862 Homestead Act and similar acts brought many thousands of homesteaders to Nebraska. See **Homestead Act**.

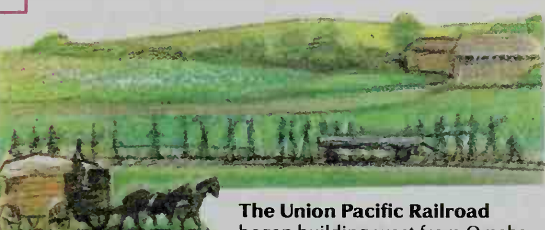
In 1865, the Union Pacific Railroad began building its line west from Omaha. The Union Pacific and the Burlington railroads also started campaigns to bring more settlers to Nebraska. The railroads sent pamphlets describing the Nebraska farmland to people throughout the East, and even to Europe. These advertisements helped the population increase to 122,993 by 1870.

Early in 1867, Congress passed an act admitting Nebraska into the Union. In doing so, Congress overrode President Andrew Johnson's veto. Congress had required Nebraska to make certain changes in its Constitution. Johnson believed this action violated the U.S. Constitution. Johnson, a Democrat, also did not want Nebraska admitted into the Union because the territory had a Republican majority. The Republicans in Congress were trying to impeach Johnson, and the President believed that two additional Republican senators might have been enough to convict him. Nebraska became the 37th state on March 1, 1867. The people elected David Butler, a Republican, as the first governor.

In 1872, Nebraska became the first state to celebrate Arbor Day. Arbor Day is a special day set aside each year for planting trees. J. Sterling Morton, a newspaper publisher and political leader from Nebraska City, originated the idea of Arbor Day.

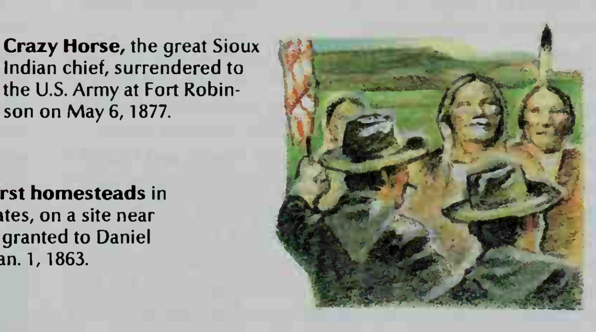
Growth of agriculture. The settlement of Nebraska slowed down between 1874 and 1877, when vast swarms of grasshoppers invaded the farmlands. The grasshoppers badly damaged oat, barley, wheat, and corn crops. Many settlers left their land and returned

Nebraska State Historical Society



Pioneer settlers, such as these shown on a farm near Ansley, were often called "sodbusters." They cut sod into blocks and used the blocks to build their houses because so few trees grew on the prairies.

Historic Nebraska



The Oregon Trail ran along the Platte and North Platte rivers. Thousands of pioneers followed this route to the West during the mid-1800's.

Buffalo Bill organized his famous Wild West Show in 1883 at his ranch near North Platte.

The Union Pacific Railroad began building west from Omaha in 1865 to complete its part of the first U.S. transcontinental line.

Crazy Horse, the great Sioux Indian chief, surrendered to the U.S. Army at Fort Robinson on May 6, 1877.

One of the first homesteads in the United States, on a site near Beatrice, was granted to Daniel Freeman on Jan. 1, 1863.

WORLD BOOK illustrations by Kevin Chadwick

Important dates in Nebraska

1682 Robert Cavelier, Sieur de La Salle, claimed the region drained by the Mississippi River, including present-day Nebraska, for France.

1714 Étienne Veniard de Bourgmont traveled up the Missouri River to the mouth of the Platte River.

1720 The Pawnee Indians defeated Spanish forces under Pedro de Villasur along the Platte River.

1739 Pierre and Paul Mallet were probably the first whites to cross Nebraska.

1762 France gave the Louisiana Territory to Spain.

1800 Spain returned Louisiana to France.

1803 The United States bought the Louisiana Territory, including Nebraska, from France.

1804 Meriwether Lewis and William Clark traveled up the Missouri River and explored eastern Nebraska.

1806 Zebulon M. Pike visited south-central Nebraska.

1813 Robert Stuart and his party followed the North Platte and Platte rivers across Nebraska.

1819 The U.S. Army established Fort Atkinson.

1843 The "Great Migration" began through Nebraska along the Oregon Trail to the West.

1854 Congress passed the Kansas-Nebraska Act, creating the Nebraska Territory.

1863 One of the first free homesteads was claimed by Daniel Freeman near Beatrice.

1865 The Union Pacific Railroad began building its line west from Omaha.

1867 Nebraska became the 37th state on March 1.

1874-1877 Vast swarms of grasshoppers invaded the Nebraska farmlands and severely damaged crops.

1905 The North Platte River Project was begun to irrigate 165,000 acres (66,770 hectares) in western Nebraska.

1934 Nebraskans voted to adopt a unicameral legislature.

1937 The unicameral legislature held its first session.

1939 Petroleum was discovered in southeastern Nebraska.

1944 Congress authorized the Missouri River Basin Project (now the Pick-Sloan Missouri Basin Program).

1960-1964 Nebraskans approved a series of constitutional amendments that strengthened the state government by raising salaries and increasing terms of government officials.

1967 Nebraska adopted both a sales and an income tax. It also celebrated its statehood centennial.

1982 Nebraska adopted Initiative 300, which prohibits corporations from buying farms or ranches in the state.

1992 Nebraska voters approve a state lottery.

East. Farmers in the Midwest saw hundreds of wagons traveling east bearing such signs as "Eaten out by grasshoppers. Going back East to live with wife's folks." But another rush of farmers poured into the state during the 1880's. Prices for land soared higher and higher. In 1890, land prices collapsed because of drought, overuse of credit, and low prices for farm products. Farmers could not pay for land bought on credit at high prices.

The farmers blamed the railroads, banks, and other business organizations for their difficulties. Many farmers joined the Populist, or People's Party, which sought reforms to help farmers. The party achieved its greatest strength in Nebraska during the 1890's. Many Populists supported William Jennings Bryan, a Democrat and the state's leading political figure of the period. See **Populism**.

In the 1890's, Nebraska farmers started to use irrigation and dry-farming methods. Congress passed the Reclamation Act in 1902, authorizing federal aid for irrigation development. Three years later, construction started on the North Platte Project to irrigate 165,000 acres (66,770 hectares) in western Nebraska. The Kinkaid Act passed in 1904 and provided for 640-acre (259-hectare) homesteads in western Nebraska. But many settlers found much of the land unsuitable for farming. Cattle ranchers bought out most of the homesteaders and returned the land to grass.

Economic depression. A boom in farm prices ended during the early 1920's. Then, in 1929, the stock market crashed and farm prices fell still further. In addition, drought again hit the state. Many farmers faced bankruptcy and the loss of their land. Banks and insurance companies took over farmers' property because the farmers could not meet their mortgage payments. But so many families were affected that sheriffs often refused to carry out court orders for public sale of the land. During the Great Depression of the 1930's, the federal government provided long-term, low-interest loans and other aid to farmers.

In 1915, a committee of the Nebraska legislature had recommended a unicameral legislature. The committee believed that a one-house legislature would eliminate the delays and the shifting of responsibility that occurs in two-house legislatures. The unicameral legislature would be more economical, because there would be fewer members. The committee's recommendation formed the basis of discussions that lasted almost 20 years. In 1934, U.S. Senator George W. Norris of Nebraska sponsored an amendment to the state Constitution for the adoption of a unicameral legislature. The voters approved the amendment in November 1934. The new unicameral legislature held its first meeting in 1937.

The mid-1900's. Geologists discovered oil in southeastern Nebraska in 1939. Oil companies drilled many wells in the area during the early 1940's, and oil became the state's most important mineral.

During World War II (1939-1945), Nebraska farmers produced millions of tons of corn, oats, potatoes, and wheat to help meet wartime food shortages. The raising of beef cattle also expanded greatly. By 1947, Nebraska's farm income reached a record of more than $1 billion yearly.

In 1944, Congress approved the Missouri River Basin Project (now called the Pick-Sloan Missouri Basin Program). This huge project calls for construction of flood control dams, hydroelectric plants, and reservoirs in Nebraska and other states drained by the Missouri River. Nebraska has already benefited from the project, though it is far from completion. See **Missouri River**.

In 1948, the Strategic Air Command (SAC) established its headquarters at Offutt Air Force Base near Omaha. The base, now home to the USSTRATCOM, has been important to the economy of Omaha. In 1949, geologists discovered oil fields in western Nebraska.

During the 1950's, Nebraska farms became larger in size but fewer in number. The increased use of machinery lessened the need for farmworkers, and many of these workers moved to towns and cities in search of jobs. By 1970, over 60 percent of Nebraska's people lived in urban areas.

The shift in population made Nebraska aware of the need to expand its industries and to attract new ones. In 1960, the voters approved an amendment to the state Constitution allowing cities and counties to acquire and develop property for lease to private businesses. Many new firms moved into Nebraska during the 1960's, partly as a result of the state's campaigns to attract industry. Employment in manufacturing increased 44 per cent in the 1960's.

During the 1960's, the state Legislature passed much important legislation. In 1963, it passed the Nebraska Education Television Act, and Nebraska became one of the first states to cover its entire area with educational television (ETV) broadcasts. In 1967, the Legislature adopted sales and income taxes to make up for the revenue that was lost when the people voted out the state property tax in 1966.

U.S. Air Force

The underground command post of the United States Strategic Command is near Omaha. The center would direct all U.S. strategic nuclear forces in a nuclear war.

Late 1900's. In 1973, Gerald R. Ford, born in Omaha, became vice president of the United States under President Richard M. Nixon. Ford became president in 1974 when Nixon resigned from the office because of his involvement in the Watergate scandal. Ford remained in office until 1977.

In 1982, Nebraskans adopted Initiative 300, an amendment to the state Constitution that bans corporations from buying farm or ranch land in the state. Initiative 300 was designed to preserve the family farm. But it has been criticized for keeping land prices down and slowing the development of corporation-owned feedlots.

In 1990, Nebraska's government passed a large tax increase to help finance public education. In a referendum, the voters approved the tax increase by a sizable margin. At the same time, they rejected a proposal to limit government spending increases to 2 percent a year. In 1992, the voters approved a state lottery to increase government revenues.

Recent developments. Nebraska still depends heavily on agriculture in spite of the rapid growth of manufacturing and service industries. The trend toward fewer but larger farms continues. Agricultural production also continues to increase through greater use of machinery, irrigation, and modern methods. Like other farm states, however, Nebraska has suffered from rising costs of operating farms and periodic declines in the market values of farm products. Donald R. Hickey and David Wishart

Nebraska, University of, is a state-supported coeducational university. It is made up of the University of Nebraska at Kearney (UNK), the University of Nebraska-Lincoln (UNL), the University of Nebraska at Omaha (UNO), and the University of Nebraska Medical Center (UNMC).

UNK has colleges of business and technology, fine arts and humanities, natural and social sciences, and education. UNL has colleges of agriculture, architecture, arts and sciences, business administration, journalism, engineering and technology, home economics, and law. UNL also has a teacher's college and a division of continuing studies. UNO has colleges of arts and sciences, business administration, education, fine arts, public affairs and community services, and continuing studies. Courses in engineering, technology, and home economics are also offered. UNMC has colleges of medicine, nursing, and pharmacy and a school of allied health pro-

fessions. It also has a hospital, a rehabilitation institute, and a laboratory cancer research center.

The University of Nebraska offers bachelor's, master's, and doctor's degrees. It is known as a strong research institution. It maintains six agricultural research and development centers across the state.

The University of Nebraska was chartered as a land-grant college in 1869. It held its first classes in 1871, in Lincoln. The current university system was established in 1968 by merging the University of Nebraska and the municipal University of Omaha and by creating a separate medical center. Kearney State College became the University of Nebraska at Kearney in 1991.

Critically reviewed by the University of Nebraska

Nebuchadnezzar II, *nehb uh kuhd NEHZ uhr* (630?-562 B.C.), reigned as king of Babylon and ruler of the New Babylonian Empire from 605 to 562 B.C. The New Babylonian Empire included much of the Middle East. Babylon, a city near present-day Al Hillah, Iraq, was the empire's capital. Nebuchadnezzar was one of the most famous kings of the ancient world. He is best remembered for conquering the city of Jerusalem and for his great building projects. His name is also spelled *Nebuchadrezzar* and *Nabu-kudurri-usur.*

In 597 B.C., Nebuchadnezzar captured Jerusalem, the capital of a Jewish kingdom called Judah (now part of Israel). He deposed the king of Judah and appointed another king. He also took payment and hostages. About 10 years later, Judah rebelled against Babylonian control. In 587 or 586 B.C., Nebuchadnezzar took the city of Jerusalem again. His army destroyed the city's Temple and palace, and sent many Jews to Babylonia as prisoners. This period of Jewish history is called the *Babylonian Exile.*

Nebuchadnezzar launched many important building and renovation programs in Babylon. He built or improved a major palace, several temples, a monumental gate known as the Ishtar Gate, a "procession way," and a stepped tower called a *ziggurat.* He probably also built the Hanging Gardens of Babylon, one of the Seven Wonders of the Ancient World. Norman Yoffee

See also **Babylon; Seven Wonders of the Ancient World** (with picture).

Nebula, *NEHB yuh luh,* is a cloud of dust particles and gases in space. The term *nebula* comes from the Latin word for *cloud.* Early astronomers also used the term for distant galaxies outside the earth's galaxy, the Milky Way. Such galaxies, called *extragalactic nebulae,* looked like hazy patches of light among the stars. But modern telescopes showed that extragalactic nebulae are actually systems of stars similar to the Milky Way.

Today, most astronomers use the term *nebulae* only for the clouds of dust and gases in the Milky Way and other galaxies. They classify these masses into two general types: *diffuse nebulae* and *planetary nebulae.* Both types are also called *gaseous nebulae.*

Diffuse nebulae are the larger of the two types. Some diffuse nebulae contain enough dust and gases to form as many as 100,000 stars the size of the sun.

A diffuse nebula may occur near an extremely hot, bright star. The intense ultraviolet light from the star energizes the gas atoms of the nebula and enables the mass to emit light. A diffuse nebula of this kind is called an *emission nebula.*

National Optical Astronomy Observatories

The Great Nebula in the constellation Orion is a huge cloud of dust and gas that appears as a misty spot in Orion's sword. The nebula's bright central area is shown in this photograph.

Astronomers believe some emission nebulae are places where new stars are forming. Gravity causes a portion of a nebula's dust and gases to contract into a much smaller, denser mass. Pressure and temperature build up within the mass of dust and gases as contraction continues for millions of years. In time, the mass becomes hot enough to shine—and forms a new star.

A diffuse nebula also may occur near a cool star. In this case, the ultraviolet light from the star is too weak to make the nebula's gas atoms give off light. But the dust particles in the diffuse nebula reflect the starlight. Astronomers refer to this kind of diffuse nebula as a *reflection nebula.*

If a diffuse nebula occurs in an area that has no nearby stars, it neither emits nor reflects enough light to be visible. In fact, its dust particles blot out the light from the stars behind them. Astronomers call such a diffuse nebula a *dark nebula.*

Planetary nebulae are ball-like clouds of dust and gases that surround certain stars. They form when a star begins to collapse and throw off the outer layers of its atmosphere. When viewed through a small telescope, this type of nebula appears to have a flat, rounded surface like that of a planet. C. R. O'Dell

See also **Astronomy** (Discovering other galaxies); **Galaxy; Milky Way.**

Nebular hypothesis, *NEHB yuh luhr hy PAHTH uh sihs,* is a theory about the origin of the solar system. Pierre Simon Laplace, a French astronomer and mathematician, formulated the theory in the late 1700's. According to Laplace, the solar system developed from a huge, extremely hot, rotating *nebula,* a cloud of dust particles and gases. The nebula cooled and contracted, leaving behind successive rings of matter as it became smaller. These rings, in turn, cooled and condensed,

forming the planets. The remaining central core of the nebula became the sun.

Many of Laplace's ideas have been greatly modified by new discoveries. But most astronomers believe the solar system did develop from a nebula. C. R. O'Dell

Neck. See **Skeleton; Giraffe** (diagram); **Throat.**

Necktie is a band of material or a bow that is worn around the neck. The tie is the most visible item of men's clothing, and it reflects the wearer's personal tastes. The *four-in-hand* and *bow* ties worn today have been about the same style since they were first worn in the 1870's.

Neckties originated in the neckcloths that men folded and wrapped around their necks, with ribbon tied over them to hold the ends in place. In the 1700's, men wore a whalebone *stock.* They fastened it in back with a strap or buckle, and tied it in front with a bow or knot. The *cravats* of the 1600's and 1700's were often frilly and lace-trimmed. By the mid-1800's, narrow string ties, knotted bow ties, and ascots had replaced the more elaborate cravat. By about 1870, most men began to prefer wearing the wider four-in-hand necktie during the day. They wore white bow ties in the evening. Black bow ties appeared in the early 1900's. Today, necktie widths vary slightly in accordance with the styling of suit lapels.

Richard Martin

Necrology, *neh KRAHL uh jee,* is a record of deaths, especially one kept by a church. Usually it shows the day, month, and year of the death. A necrology may be a list of persons who have died within a certain time. It also may be an obituary notice.

Necropolis, *neh KRAHP uh lihs,* is a Greek word which means *city of the dead*—that is, a cemetery. Archaeologists and historians usually call the cemetery of an ancient city a *necropolis.*

Archaeologists have found large and well-known necropolises in Egypt, near such ancient cities as Memphis and Thebes. The tomb of Tutankhamen in the Valley of the Kings, near Luxor, is one of hundreds of tombs in the huge necropolis there (see **Tutankhamen; Valley of the Kings**). A necropolis also surrounds the pyramids at Giza. Another necropolis, dating from the Bronze Age, is at Hallstatt, Austria. Many necropolises have also been found in America. One at Paracas, an archaeological site in Peru, dates back to the days before the Inca ruled.

Ancient peoples often buried tools, weapons, and personal belongings with the dead. Sometimes they also carved or painted religious texts, information about the dead, and scenes from everyday life. Archaeologists and historians have learned much about ancient civilizations from necropolises. Leonard H. Lesko

Nectar is a sugary liquid that is produced by flowering plants. Nectar is secreted from tissues called *nectaries* that are frequently in the flowers or other parts of flowering plants. Honey bees collect nectar to produce honey. While gathering nectar, bees usually spread pollen from one plant to another. Hummingbirds and many kinds of moths and butterflies also feed on nectar.

Richard C. Keating

See also **Bee** (Making honey).

Nectarine, *NEHK tuh REEN* or *NEHK tuh reen,* is a fruit much like the peach. The only important difference between the two is that nectarines have smooth skins and peaches are fuzzy. They come from identical trees. Nectarines often originate from peach seeds, and peaches may come from nectarine seeds. Botanists do not know which originated first, nectarines or peaches.

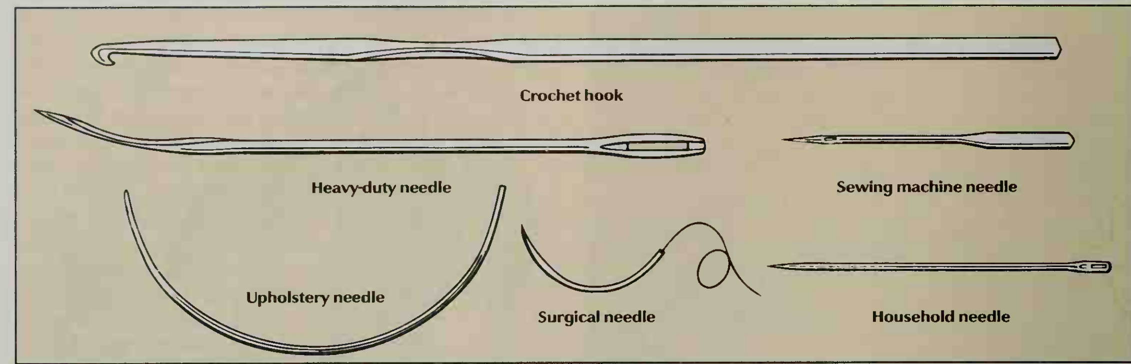
James E. Pollard

Scientific classification. The nectarine is in the rose family, Rosaceae. It is *Prunus persica.*

See also **Peach.**

WORLD BOOK illustration by Kate Lloyd-Jones, Linden Artists Ltd.

The nectarine is a fruit that resembles a peach, except that it has a smooth skin. The fruit encloses a single, large seed.



Needle is a simple-looking tool, with a fine point at one end and a tiny eye at the other. But needles are not easy to make. Each needle undergoes at least 20 production processes.

Sewing needles are made from coils of steel wire. These coils of wire are cut into pieces long enough for two needles by a wire straightening and cutting machine. The straightened wires are then ground to a point on each end on a grindstone. While the wires are being ground, they are held by a device which makes them turn all the time they are touching the grindstone. This turning makes the needle points fine and even.

After each end of the wire is ground to a point, the center section of the wire pieces is stamped by a machine. The machine stamps a flat place for the eyes. Next, the two eyes are punched in the middle of each piece of wire by another machine. A piece of wire is then run through the eyes. At this time, the needles are cut apart, leaving the needles hanging on the wire. Next, the heads, or eye ends, are rounded and smoothed. Finally, the needles are *tempered* (toughened), and polished, sorted, and packed.

Special needles are made for special uses. Sewing-machine needles are made with the eye near the point. In addition, they have a groove on one side, which acts as a guide for the thread that goes through the needle's eye.

A sewing needle for people with poor vision has the eye split so that the needle can be threaded through the top. A *crochet hook* is a type of needle with a hook at the end. The thread is caught in the hook instead of going through an eye. Upholstery sewing needles and

WORLD BOOK illustration by Art Grebetz

Different kinds of needles are made for special purposes. For example, a crochet hook has a hook to catch the thread. A heavy-duty needle is used to sew thick canvas or cloth for sails. Surgical needles are manufactured with thread attached to them for easy use in an operating room.

surgical needles are curved. David A. Bagshaw

See also **Sewing**.

Needlepoint is a form of embroidery in which stitches are sewed through spaces or squares of an open-mesh fabric called the *canvas.* It is used to make clothing, pictures, purses, upholstery, and many other items. Needlepoint was once known as *tapestry.*

The pattern may be painted or printed on the canvas. The sewer uses a blunt-ended tapestry needle and a variety of soft threads. The threads may be cotton embroidery, crewel, knitting or Persian yarns, and sometimes leather strips or ribbon. Needlepoint stitches create a flat design.

WORLD BOOK photo

There are dozens of needlepoint stitches, ranging from simple techniques to complicated ones. This photograph shows four popular stitches.

The basic needlepoint stitch is the *cross stitch.* It occupies a square area over an intersection of the canvas mesh. Other stitches create various patterns and designs. These stitches include the slanting *basketweave* and *knotted* styles, and the *bargello,* a long vertical stitch. Needlepoint may be worked in fine thread and small stitches called *petit point,* or in large stitches known as *gros point.* Dona Z. Meilach

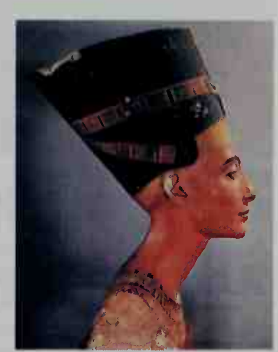
Neem tree is an Asian tree that has many important uses for people. Manufacturers use parts of the neem tree to make *pesticides* (chemicals used to kill pests). In addition, people have treated diseases with the tree's leaves, seeds, bark, and roots for centuries.

The neem tree is native to south Asia, but it also grows in other parts of Asia and in Africa, the Caribbean, and Central America. The tree may grow up

WORLD BOOK illustrations by Bridgette James, Wildlife Art Ltd.

The neem tree produces olivelike fruits. Manufacturers use chemical compounds from the tree's seeds to make pesticides.



to 90 feet (27 meters) tall. It produces white, honey-scented flowers and olivelike fruits.

Seeds from the neem tree contain a compound called *azadirachtin.* People use azadirachtin along with other neem compounds to make pesticides. Such pesticides are environmentally safe and can help control more than 250 pests, including aphids, mites, and locusts. Manufacturers also use neem tree parts in such products as soap, toothpaste, and acne ointment.

People from south Asia have traditionally made a number of natural remedies from the neem tree. For example, they have produced antiseptic paste from the leaves to treat skin diseases and sores. Michael J. Tanabe

Scientific classification. The neem tree belongs to the mahogany family, Meliaceae. It is *Azadirachta indica.*

Nefertiti, *NEHF uhr TEE tee,* was an ancient Egyptian queen, the wife of Akhenaten, a *pharaoh* (king) who ruled from 1367 to 1350 B.C. Akhenaten was the first pharaoh to preach *monotheism* (belief in one god). Nefertiti was a firm supporter of Akhenaten's teachings and assisted him in the new religious ceremonies. Akhenaten and Nefertiti's reign is called the *Amarna Revolution* because of the many changes in art, religion, and social practices they made.

Painted limestone sculpture (about 1355 B.C.) by an unknown Egyptian artist; Egyptian Section, Staatliche Museen, Berlin

Nefertiti

Nefertiti is the subject of several sculptured portraits. A limestone head of her in the Berlin Museum and an unfinished head in the Egyptian Museum in Cairo are among the best known of these portraits.

Negative number. See **Algebra** (Positive and negative numbers).

Negev, *NEH gehv,* is the triangular southern half of Israel. It extends from Beersheba south to the port of Elat on the Gulf of Aqaba (see **Israel** [terrain map]). The Negev is a semidesert tableland from 1,000 to 2,000 feet (300 to 610 meters) above sea level. It includes both flatlands and limestone mountains. Much of the Negev is covered by a layer of fertile loam, but rainfall needed for growing crops is insufficient. The Israelis have farmed part of the Negev by irrigation. They have irrigated the land with water brought from the Sea of Galilee through the National Water Carrier, a system of pipelines, canals, and tunnels. The Israelis have also mined phosphates and copper in the Negev. Bernard Reich

Negligence is the legal term for carelessness. The law uses negligence as a test to determine whether a person involved in an accident is responsible for any loss or injury that occurs in the accident.

The law considers negligence the failure to act the way a reasonably careful person would act under the circumstances. But the law does not say what specific conduct is negligent. The decision is made by a judge or a jury after consideration of the circumstances of each case. In general, a person whose negligence harms or kills another person or damages that person's property must pay compensation.

If the injured person was partly responsible for the occurrence, that person's carelessness is considered *contributory negligence.* In some cases, the contributory negligence prevents the injured person from being awarded compensation. In other cases, the judge or jury may compare the injured person's contributory negligence to the fault of the others involved. The injured person's compensation may then be reduced in proportion to his or her share of the blame.

English and American law generally do not regard negligence as a crime. But in cases where someone is killed through negligence, the negligent person may be charged with a crime called *manslaughter* or *negligent homicide.* Edward J. Kionka

See also **Damages; Malpractice suit; Product liability suit; Tort.**

Negotiable instrument, *nih GOH shuh buhl,* refers to a type of legal exchange or document that is either a promise or an order to pay money. Negotiable instruments can be used as evidence of indebtedness or as a substitute for money. A person holding a negotiable instrument is usually in a good legal position to collect from the person who signed it. The signer is called a *maker* or *drawer.* The use of negotiable instruments is regulated by the Uniform Commercial Code, which has been adopted in whole or in part by all 50 states.

Negotiable instruments have six characteristics: (1) they must be in writing; (2) they must be signed by a maker or drawer, who promises to pay money; (3) they must contain an unconditional promise or order to pay; (4) payment must be in money; (5) instruments must be payable on demand or at a specific date; (6) they must be payable to the bearer or to the order of a person.

Forms. Common forms of negotiable instruments include promissory notes, drafts, and checks. Promissory notes include bonds, certificates of deposit from banks, and real estate mortgage notes. Drafts include bills of exchange, bank drafts, cashier's checks, money orders, and traveler's checks.

Many instruments are not strictly negotiable but have some features of negotiable instruments. For example, instruments calling for the delivery of goods or property instead of money may possess many of the legal qualities of negotiability. Bills of lading and warehouse receipts are examples. A bill of lading is given for goods in transit. A warehouse receipt is given for goods in storage. Each of these instruments can be written so that the promise to pay is negotiable.

Endorsement. Negotiable instruments are usually transferred or handed over to another person by endorsement. An endorsement is a signature or other writing on the back of the instrument that indicates or proves the instrument has been transferred.

An endorsement may be written in different ways. If the holder of the instrument simply signs it, the endorsement is called *in blank. A special endorsement* or an *endorsement in full* names the person to whom payment is to be made. A *restrictive endorsement* forbids further transfer. A check signed "Pay to First National Bank only" is a restrictive endorsement.

Every endorser of a negotiable instrument is usually liable for its face value, if the maker does not or cannot

pay it. The endorser may add the words "without recourse" if he or she wishes to avoid liability. Such an endorsement does not affect the value of the instrument or prevent further endorsement. Joanna H. Frodin

Negritos, *nih GREE tohz,* are peoples who live in small, isolated groups in Asia and northern Australia and who resemble Pygmies. They spread from the Andaman Islands of the Indian Ocean to the Malay Peninsula, the Philippines, Indonesia, New Guinea, and Australia. Like African Pygmies, Negritos have dark skin and tightly curled brown hair and are less than 5 feet (1.5 meters) tall. Negritos have traditionally lived by hunting and by gathering plants and fruits. Today, however, many Negritos are gradually becoming like people of the more complex societies. M. G. Bicchieri

Negroes. See **African Americans.**

Negroid race. See **Races, Human** (The three-race theory).

Nehemiah, *NEE uh MY uh,* **Book of,** is a book of the Hebrew Bible, or Old Testament. It is named for an important Judean figure in ancient Palestine. Nehemiah was appointed governor of Judea by the ruling Persians, serving in that office from 445 to 433 B.C. and for several years after 432 B.C. His vigorous programs of political and religious reforms, which were recorded in the book, renewed and restored the faltering Jewish community in Palestine in the 400's B.C. See also **Ezra, Book of; Bible** (The Hebrew Bible). Carol L. Meyers

Nehru, *NAY roo* or *NEH roo,* is the family name of a father and his son, daughter, and granddaughter who became distinguished in Indian public affairs. The father and the son prefixed their names with their caste name, *pandit. Pandit* also means *scholar.* The daughter, the first woman president of the United Nations General Assembly, used Pandit as her last name (see **Pandit, Vijaya L.**). The granddaughter, Indira Gandhi, became the first woman prime minister of India (see **Gandhi, Indira**). Her son Rajiv Gandhi also served as prime minister (see **Gandhi, Rajiv**).

Motilal Nehru, *MOH tih lahl* (1861-1931), came from a distinguished family in the province of Kashmir. He studied law at Muir College in Allahabad and built up a prosperous legal practice. He was at first a close friend of the English in India, a member of wealthy social groups, and a follower of Western ways. But in the 1920's, he was converted to the cause of Indian independence and became a follower of Mohandas Gandhi (see **Gandhi, Mohandas K.**). Nehru gave up his law practice and began to live in a simple manner.

He wrote the *Nehru Report* in 1928. It outlined a new constitution for India. In 1930, he became active in Gandhi's civil disobedience movement. His energetic efforts on behalf of freedom and several terms in prison weakened Nehru's strength, and he died the next year. Nehru was born in Agra.

Jawaharlal Nehru, *juh WAH hur lahl* (1889-1964), the son of Motilal Nehru, was India's first prime minister. He served as prime minister from 1947 until his death. He dominated Indian affairs. He worked to establish a democracy and to improve living standards. He favored a state-controlled economy.

T. S. Satyan, Black Star

Jawaharlal Nehru was the first prime minister of India. He served from 1947 until his death in 1964.

Nehru gained international recognition for opposing alliances with the great powers and for promoting *neutralism* (nonalignment). He advocated nonaggression and ending atomic bomb tests. But he was criticized when Indian forces seized Goa and other Portuguese territories in India in 1961.

Nehru acted as a spokesman for nonaligned nations in Asia and Africa. He favored admitting Communist China to the United Nations until Chinese forces attacked the Indian border in 1962.

Nehru and his father were fond and proud of each other, but occasionally disagreed. At one time, the father favored only dominion status for India, while the son demanded complete independence.

Nehru was born in Allahabad. He went to school in England and graduated from Harrow School and Cambridge University. He returned to India after his schooling and became active in politics. He supported Mohandas Gandhi's civil disobedience movement in 1920. Nehru served as general secretary of the All India Congress Committee in 1929. That same year, he was elected president of the Indian National Congress. He held that post again in 1936, 1937, and 1946. The British often imprisoned him for his nationalistic activities during this period. Nehru was a master of English, and his writings are widely read. Robert LaPorte, Jr.

Neihardt, *NY hahrt,* **John** (1881-1973), was an American author known for his poetry and fiction about American Indians. His major work is a five-part epic poem called *The Cycle of the West.* It describes how white settlers conquered the Indians of the Great Plains during the 1800's. The epic consists of *The Song of Hugh Glass* (1915), *The Song of Three Friends* (1919), *The Song of the Indian Wars* (1925), *The Song of the Messiah* (1935), and *The Song of Jed Smith* (1941). Neihardt's *Black Elk Speaks* (1932), a biography of a Sioux medicine man, became his most widely read book.

John Gneisenau Neihardt was born near Sharpsburg, Illinois. He lived with the Omaha Indians in Nebraska from 1901 to 1907. Many of the themes in his works reflect his experiences among the Omaha and other tribes of the Great Plains. In 1921, Neihardt was named poet laureate of Nebraska. From 1926 to 1938, he was literary editor of the *St. Louis Post-Dispatch.* Neihardt served as poet-in-residence at the University of Missouri from 1949 to 1966. Elmer W. Borklund

Nekton. See Ocean (The nekton; pictures).

Nelligan, Emile. See **Canadian literature** (Poetry: 1850-1918).

Nelson, Horatio (1758-1805), was Britain's greatest admiral and naval hero. In 1805, he defeated the combined French and Spanish fleets at Trafalgar in the greatest naval victory in British history. His victory broke France's naval power and established Britain's rule of the seas for the rest of the 1800's.

Early life. Nelson was born at Burnham-Thorpe in the English county of Norfolk, on Sept. 29, 1758. His father was rector of the local church, and his mother was a member of the famous Walpole family. Nelson was a small, frail child. But he fell in love with the sea early in life and made up his mind to be a sailor. He spent much time piloting small boats on the river near his home. When he was 12 years old, his uncle, Captain Maurice Suckling, planned a voyage to the Falkland Islands. Nelson begged his family for permission to go along, and he was finally allowed to do so. He owed much of his early training to Captain Suckling, who had him transferred from time to time to ships engaged in different types of service. Suckling also encouraged him to study navigation and to practice boat sailing.

Joins the navy. At the age of 15, Nelson went aboard the *Carcass* as a *coxswain* (steerer). He served on that vessel in an expedition to the Arctic seas. On his return, he was sent to the East Indies on the *Seahorse.* On the East Indies voyage, he caught a fever that seriously damaged his health. But he became a lieutenant in the Royal Navy at 18.

In 1779, when not yet 21, he was given command of the frigate *Hinchinbrook.* He was known as a capable officer. His professional ability and his talent for getting along with his men helped him to rise rapidly in the service. A cruise to Central America brought on a second tropical illness and Nelson was sent home in feeble health.

Nelson was given duty on the North Sea as soon as he recovered from the fever. He was then assigned to service in Canadian waters and developed a great fondness for Canada, where the climate strengthened his health. Nelson was given command of the frigate *Boreas,* stationed in the West Indies in 1784. He spent three years there.

Nelson married the widow of Josiah Nisbet, an English doctor, in the West Indies in 1787. Prince William, who later became King William IV of England, gave the bride away at the wedding. Nelson was recalled from

Detail of *Nelson Falling* (1825), an oil painting on canvas by Denis Deighton; National Maritime Museum, Greenwich, England

Horatio Nelson led the British to victory over the French and Spanish fleets at Trafalgar in 1805. Nelson, Britain's greatest naval hero, was fatally wounded in this battle, *above right.*

active service soon afterward. He remained on the retired list until soon after the outbreak of war with France in 1793.

Brown Bros.
Horatio Nelson

Wounded at Calvi. In 1793, Nelson was placed in command of the *Agamemnon* and sailed to join the British fleet in the Mediterranean Sea. This voyage began seven years of almost continual warfare at sea. Nelson was one of the British commanders who blockaded Toulon, France, and captured Corsica. He was wounded at Calvi, on the Corsican coast, and lost the sight of his right eye.

Nelson next distinguished himself at the Battle of Cape St. Vincent in 1797. He served under Admiral Sir John Jervis, who defeated the combined French and Spanish fleets. Nelson was made a Knight of the Bath for his part in this victory. He had become a rear admiral a week before the battle. A few months later, Nelson led a small landing party in an attack on the strongly fortified port of Santa Cruz de Tenerife in the Canary Islands. The attack was a bold gamble, but unlike others, it failed. The British were driven off with heavy losses and Nelson's right arm was badly mangled up to the elbow. The arm had to be cut off in a crude amputation in a pitching boat, and Nelson was invalided home to England in great pain. But he soon returned to duty.

Battle of the Nile. Napoleon, victorious in Europe, began to gather a French fleet for an expedition to conquer Egypt. Nelson was sent to watch the French ships at Toulon. A storm came up, and under its cover the French fleet escaped. Nelson followed it in a long and tiresome pursuit. He finally cornered the French ships in Abu Qir Bay. There, he attacked and almost destroyed the fleet on Aug. 1, 1798. This engagement is known to history as the Battle of the Nile. It cut off Napoleon's army in Egypt and ruined his Egyptian campaign. A year later, Napoleon deserted his army in Egypt and sneaked across the Mediterranean in a tiny ship. The victory over Napoleon in the Battle of the Nile made Nelson famous. He was made Baron of the Nile and given a large sum of money.

Nelson was wounded again in this battle, and he went to Naples to recover. Emma Lady Hamilton, wife of Sir William Hamilton, the British ambassador to Naples, fell in love with the battered, one-eyed, one-armed naval hero and became his mistress. Her influence over Nelson became so great that he disobeyed his orders to leave Naples and join a squadron in the Mediterranean. It was Nelson's good fortune that no British defeat resulted from his refusal to leave Naples. Nelson was condemned for his conduct, however, when he returned to England.

Battle of Copenhagen. Nelson became a vice admiral in 1801, and sailed for Copenhagen, Denmark, in the squadron of Admiral Hyde Parker. Britain had claimed the right to search neutral ships for contraband of war. However, Denmark refused to allow its ships to be searched. A council of war chose Nelson to make the attack on the Danish fleet. Admiral Parker later became doubtful of the attack's outcome. He signaled Nelson to retire. But Nelson clapped his telescope to his blind eye and studied the signal. "I really do not see the signal," he said to an aide. He ignored Parker's order and turned what might have been a defeat into a great victory. After the Battle of Copenhagen, he was given the title of viscount.

Victory at Trafalgar. Nelson was made commander in chief of the fleet in May 1803. Sailing on the flagship *Victory,* he once more went in search of the French. He found the French fleet at Toulon, but it slipped away from him. Nelson chased the French to the West Indies and back. It was more than two years before Nelson was able to bring the French fleet to battle off Cape Trafalgar on the coast of Spain, on Oct. 21, 1805 (see **Trafalgar, Battle of**). Nelson hoisted his famous signal, "England expects that every man will do his duty." With only 27 vessels, Nelson attacked the combined French and Spanish fleets. One of the great naval battles of all time followed. Napoleon's fleet, which had 33 warships, was destroyed.

Nelson was wounded at the height of the battle. He was carried below with a sharpshooter's bullet in his spine. Nelson died during the battle, but he lived long enough to know that the British fleet had defeated the French and Spanish fleets. Nelson's last words were, "Thank God I have done my duty."

One of Nelson's great characteristics as a commander was his willingness to give full credit to his officers and men. After the Battle of Copenhagen, he refused an honor given him by the City of London because he alone was to be honored. Nelson replied, "Never till the City of London thinks justly of the merits of my brave companions of the second of April can I, their commander, receive any attention from the City of London." The poet Robert Southey wrote of Nelson, "England has had many heroes. But never one who so entirely possessed the love of his fellow countrymen. All men knew that his heart was as humane as it was fearless ... that with perfect and entire devotion he served his country with all his heart, and with all his soul, and with all his strength. And therefore they loved him as truly and fervently as he loved England."

Nelson monument. After Nelson's death, he became such a hero in the United Kingdom that the government erected a large column topped with a statue of him in Trafalgar Square, which was named for Nelson's last battle. The monument, called Nelson's Column, is one of the most famous landmarks in London. See **London** (picture: Trafalgar Square). Philip Dwight Jones

Nelson, Thomas, Jr. (1738-1789), an American soldier and statesman, served as a Virginia delegate to the Continental Congress from 1775 to 1777 and again in 1779. He was one of the Virginia signers of the Declaration of Independence in 1776. During the Revolutionary War in America, Nelson commanded the Virginia militia and fought in the Battle of Yorktown in 1781. He also served as governor of Virginia that year. He was born on Dec. 26, 1738, in Yorktown, Virginia. He died on Jan. 4, 1789.

James H. Hutson

Nelson, William Rockhill (1841-1915), founded and built the *Kansas City* (Missouri) *Star,* a crusading newspaper, in 1880. The *Star* campaigned against municipal corruption, and for civic reform and a rehabilitation program. This program gave Kansas City parks, broad boulevards, and an art gallery. Nelson was born in Fort Wayne, Indiana. Joseph P. McKerns

Nelson River is the longest river in Manitoba. From its outlet at the northern end of Lake Winnipeg, it flows about 400 miles (640 kilometers) northeast to empty into Hudson Bay. It is the outlet of Lakes Winnipeg, Winnipegosis, and Manitoba, and the Winnipeg, Red, and Saskatchewan river systems. The watercourse to the head of the Saskatchewan's farthest tributary is 1,600 miles (2,580 kilometers) long. Once a transportation link for Hudson's Bay Company, the river is now a source of hydroelectric power. A power station at Kelsey Rapids supplies power to the nickel mines and refinery at Thompson, Man. Other stations are at Jenpeg, Kettle Rapids, Limestone Rapids, and Long Spruce.

John S. Brierley

Neman River is a waterway in eastern Europe. The Neman rises southwest of the city of Minsk in Belarus. It flows generally westward through Belarus and Lithuania and empties into the Baltic Sea (see **Europe** [terrain map]). The Neman flows 582 miles (937 kilometers) through a landscape of lakes and forests. Its chief branches are the Viliya, Shchara, Sheshupe, and Merkys rivers. The Neman is called the Nyoman in Belarus and the Nemunas in Lithuania. Its historical names include the Memel and the Niemen.

The Neman is frozen from late November until March. During the rest of the year, it is used for floating timber. Barges can sail up the Neman for about 400 miles (644 kilometers) from its source. A dam on the river near the city of Kaunas, Lithuania, has a hydroelectric power plant. Leszek A. Kosinski

Nematode, *NEHM uh tohd,* is a group of slender worms. When viewed from the end or cut crosswise, nematodes are round. They are also called *roundworms.* Their bodies are usually pointed at the ends. Some are so small they can be seen only through a microscope, and others grow over 3 feet (91 centimeters) long. Most males are smaller than females.

Many species of nematodes live in soil and water. Some species live as parasites in plants. Others, including hookworms, lungworms, pinworms, trichinae, and filariae, live as parasites in human beings and in such animals as dogs, sheep, and horses. Nematodes cause disease in plants, humans, and domestic animals.

Scientific classification. Nematodes make up the phylum Nematoda. David F. Oetinger

Nene, *NAY nay,* also known as *Hawaiian goose,* is a rare bird of Hawaii. It also is the official bird of Hawaii. Nenes measure 22 to 26 inches (56 to 66 centimeters) long and are brown with long, buff-colored neck feathers. They live in open country and feed chiefly on grass. The female lays three to six creamy-white eggs. In 1950, only about 50 nenes existed. Since then, the number has greatly increased due to breeding and protection programs. See also **Bird** (picture: Birds of Australia and the Pacific Islands); **Hawaii** (picture: The state bird).

Scientific classification. The nene is in the family Anatidae. Its scientific name is *Nesochen sandvicensis.* Charles Walcott

Neodymium, *NEE uh DIHM ee uhm* (chemical symbol, Nd), is a metallic element belonging to the rare earth group. Its atomic number is 60, and it has an atomic weight of 144.24.

C. F. Auer von Welsbach of Austria discovered the element in 1885. He separated the so-called element didymium into neodymium and praseodymium.

Neodymium melts at 1021 °C, and boils at 3074 °C. It has a density of 7.003 grams per cubic centimeter at 25 °C. The metal can be prepared by electrolysis of its halide salts, or by the reduction of these salts by alkaline earth metals in the presence of heat. The ceramic industry uses salts of neodymium to color glass and in glazes. The metal is present in *misch metal,* an alloy with many uses, and in the important Nd-YAG laser.

Larry C. Thompson

Neolithic Period. See **Stone Age.**

Neon is a chemical element that makes up about 1 part per 65,000 in the earth's atmosphere. The British chemists Sir William Ramsay and Morris W. Travers discovered the element in the atmosphere while they were studying liquid air in 1898. Ramsay had predicted the existence of this gas in 1897. Ramsay and Travers named the gas *neon,* for the Greek word that means *new.*

Neon is used chiefly for filling lamps and luminous sign tubes. Its usual color in lamps is bright reddish-orange. The addition of a few drops of mercury makes the light a brilliant blue.

Many airplane beacons use neon light because it can penetrate fog. A number of airplane pilots have reported that neon beacons were visible for 20 miles (32 kilometers) when it was impossible for them to see other kinds of lights.

Neon lamps are made by removing the air from glass tubes and then filling them with neon gas. When about 15,000 volts of electricity are applied to the tube, an electric discharge occurs, and the tube glows fiery reddish-orange. Instead of a filament, a neon tube has two electrodes sealed within it. The neon forms a luminous band between these electrodes.

Commercially, neon is obtained as a by-product of liquid air manufacture. Neon liquefies under normal pressure at −246.048 °C, and it freezes at −248.67 °C. When air is liquefied at about −200 °C, neon is left behind as a gas. Neon is expensive, but very little is needed for lamps. Signs use 1 quart per 200 to 300 feet (1 liter per 64 to 97 meters) of tubing. Liquid neon is often used as a low-temperature *refrigerant* (cooling agent).

Neon is a colorless, odorless gas. It does not react readily with other substances, though it may form a compound with fluorine. Neon is classed as a *noble gas.*

David R. Frazier

Neon signs brighten entertainment and shopping areas. This hotel in Las Vegas, Nevada, has glowing signs to attract visitors. Stores often use neon signs to advertise products.

Its symbol is Ne. It has an atomic number of 10 and an atomic weight of 20.1797. Frank C. Andrews

Neonatology, *NEE oh nay TAHL uh jee,* is the branch of medicine concerned with the care of infants during the first 28 days of life. The highest death rate in life occurs during this period, which is known as the *neonatal period.* A doctor who specializes in the care of newborn infants is called a *neonatologist.*

The major cause of neonatal death is premature birth—that is birth before the pregnancy reaches *term.* Birth occurs at term if it happens from the 38th through the 41st week of pregnancy. The more prematurely the baby is born, the less it weighs and the higher its risk of death. Most neonatal deaths occur among infants who weigh less than $5\frac{1}{2}$ pounds (2.5 kilograms) at birth. The average weight of a baby born at term is $7\frac{1}{2}$ pounds (3.4 kilograms). Many neonatal deaths also result from birth defects in the infant or medical problems of the mother, such as infectious diseases.

Many major medical centers have a neonatal intensive care unit. There, sick infants are usually cared for by a team of neonatologists, neonatal nurses, respiratory therapists, pediatric and surgical consultants, and other supporting staff. Advancements in neonatal intensive care have made it possible for infants born as much as 12 to 18 weeks prematurely to survive. Kwang-sun Lee

Neoplasm. See Tumor.

Neoplatonism, *nee oh PLAY tuh nihz uhm,* was a dominant school of philosophy from the A.D. 200's to the 500's. Neoplatonism, which means *New Platonism,* developed from the philosophy of Plato. It also absorbed elements of Pythagorean, Aristotelian, and Stoic thought. Plotinus founded Neoplatonism. Other neoplatonists included his followers Porphyry and Proclus.

The Neoplatonists developed their philosophy from Plato's theory of *forms.* According to this theory, all things that can be perceived are only imperfect copies of forms, which are their perfect essence. Knowledge comes from grasping with the mind the essential form of a thing, rather than from perceiving with the senses its many incidental qualities. Plotinus went beyond this theory to divide Plato's realm of forms into various levels of reality. Each level depends for its reality on those above it.

Transcending all reality is *The One,* which is in itself unknowable. One cannot even say that The One *is,* because The One is beyond being. But The One expands or "overflows" into the levels beneath it, as light shines through darkness, becoming dimmer as it goes.

The highest level of reality is that of *Intellect,* in which forms exist as ideas beyond time and space. The next level, which is dimmer and less real, is that of *Soul.* Next is the level of *Nature,* which is the dark realm of material bodies. Beneath these levels is *Matter,* which Plotinus describes as "not-being" and as the principle of evil. We inhabit the lower levels but yearn to turn upward and return to the higher ones. Our souls can leave our bodies and "travel" to the realm of Intellect, where forms reside as ideas in the divine mind.

The Neoplatonists believed the purpose of philosophy is to escape from the attachment we feel to our bodies and physical environment. Thus, we achieve immortality by finding our true place in the world of forms.

Neoplatonism was an important philosophical movement. Plotinus influenced Saint Augustine in developing his principles of Christian theology. Proclus's views helped shape Christian *negative theology,* which points out the limits of human ability to comprehend a supreme being. Neoplatonist thought influenced Near Eastern philosophy as early as the A.D. 400's. The Neoplatonic emphasis on spiritual, as opposed to physical, beauty was important to the idea of *platonic love* during the Renaissance. S. Marc Cohen

Nepal, *nuh PAWL,* is a country in south-central Asia. The highest mountain range in the world—the Himalaya—and a region of hills and valleys cover about 80 percent of Nepal. The Tarai (or Terai)—a flat, fertile river plain along Nepal's border with India—covers the rest of the country.

Kathmandu is the capital of Nepal and its largest city. Mount Everest, the highest mountain in the world, rises 29,035 feet (8,850 meters) above sea level in the Himalaya on Nepal's border with Tibet, a region in China.

About 45 percent of Nepal's people live in the Tarai. The rest of the people live in the hills and valleys region or in the mountains. Patches of farmland lie among the mountains of Nepal. These cultivated areas account for only about 10 percent of the country's mountainous area, but almost all of the mountain people live there. Nepal is poor and undeveloped. The country also has a high rate of disease and illiteracy.

Facts in brief

Capital: Kathmandu.
Official language: Nepali.
Area: 56,827 mi² (147,181 km²). *Greatest distances*—east-west, 500 mi (805 km); north-south, 150 mi (241 km).
Elevation: *Highest*—Mount Everest, 29,035 ft (8,850 m) above sea level. *Lowest*—150 ft (46 m) above sea level.
Population: *Estimated 2002 population*—25,009,000; density, 440 per mi² (170 per km²); distribution, 89 percent rural, 11 percent urban. *1991 census*—18,491,097.
Chief products: Cattle, corn, rice, oilseeds, sugar cane, wheat.
National anthem: "Rashtriya Dhun" ("National Anthem").
Flag: The flag has two crimson triangles trimmed in blue, one above the other. The top triangle features the moon and the lower one the sun, symbols of the long life of Nepal. It is the only nonrectangular country flag. See **Flag** (picture: Flags of Asia and the Pacific).
Money: *Basic unit*—rupee. One hundred paisa equal one rupee.

Government. Nepal is a constitutional monarchy. A prime minister serves as head of the government. The king serves as head of state and commander in chief of the armed forces. Nepal's parliament consists of a 60-member National Council and a 205-member House of Representatives. The people elect the representatives to five-year terms. Thirty-five members of the National Council are elected by the house, 15 members are elected by an electoral college, and 10 are appointed by the king. Members of the National Council serve six-year terms.

The king usually appoints the leader of the largest party in the house as prime minister. The prime minister heads a council of ministers, whose members are appointed by the king on the advice of the prime minister. The council helps carry out government functions.

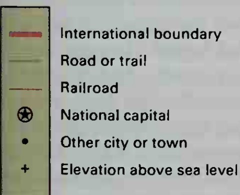
Nepal is divided into 75 districts for purposes of local government. Each district is divided into cities and villages. The people elect a committee and a committee head to administer each district, city, and village.

The Supreme Court is Nepal's highest court. It consists of a chief justice and 14 judges. The chief justice is appointed by the king, upon recommendation of a constitutional council. The other judges of the Supreme Court are also appointed by the king, upon recommendation of a judicial council.

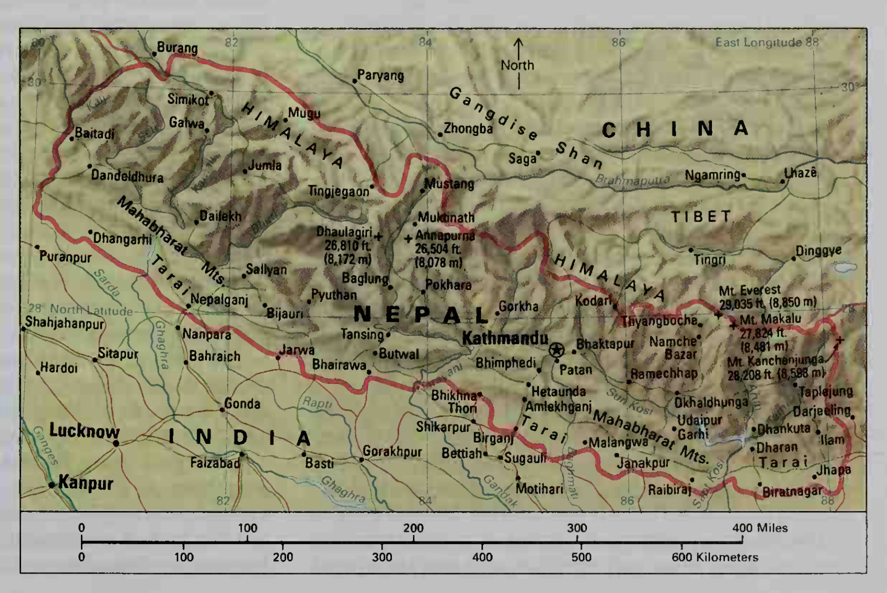
People. Most Nepalese are closely related to the peoples of northern India. Other Nepalese are of Tibetan descent. Still others are of mixed Indian-Tibetan descent. Most people live in small villages that consist of two-story houses made of stone or mud-brick.

About 80 percent of Nepal's people earn their living through farming and related occupations. Most farms produce barely enough to support one family. Nepalese farmers trade any surplus crops they raise for such important items as kerosene and salt. Other Nepalese make their living as carpet weavers, clothing manufacturers, or craftworkers. Still others work as merchants, for the government, or in the tourist industry.

The Sherpas and the Gurkhas, two Nepalese groups, are known for their special skills. The Sherpas, a Himalayan people, have won fame as guides and porters for mountain-climbing expeditions. Sherpa men and women carry heavy loads up to high altitudes. Many Gurkhas serve as soldiers in the British or Indian army.

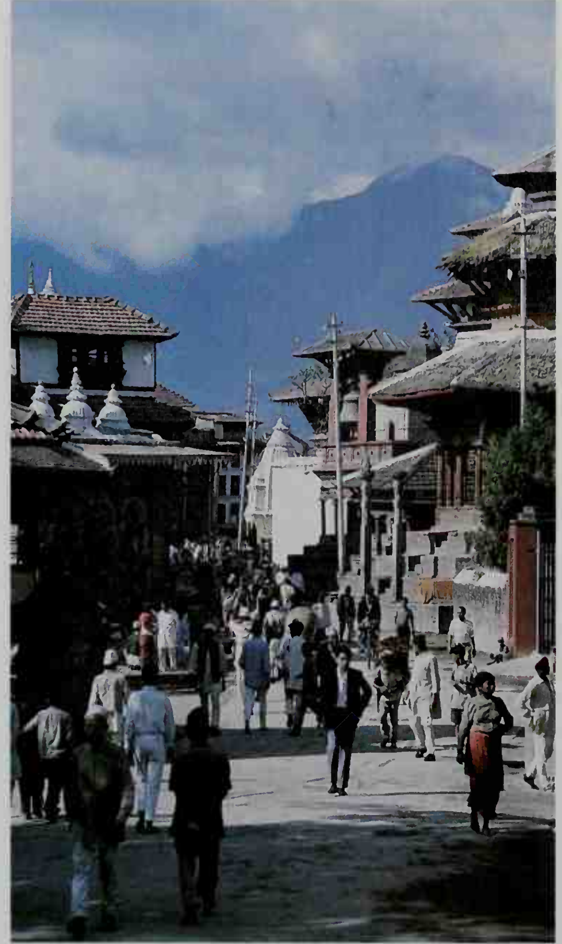


Hinduism is the official religion of Nepal. However, the Nepalese have combined the beliefs and practices of Hinduism with those of Buddhism. Buddha, the founder of Buddhism, was born in Nepal about 563 B.C. The Nepalese people celebrate the festivals of both Buddhism and Hinduism, and Buddhist shrines and Hindu temples are considered equally sacred. Many of the people of Nepal also worship local gods and spirits and consult *shamans* (magical healers) in times of illness.



Nepal has few physicians, and such diseases as cholera, leprosy, and tuberculosis occur frequently. Since the early 1950's, the government has greatly reduced malaria. This has enabled many Nepalese from the mountains to settle in the Tarai, where malaria used to be widespread.

Some Hindus in Nepal practice *polygyny,* a form of marriage in which a husband has more than one wife. *Polyandry,* the practice of a wife having more than one husband, occurs among some of the Tibetan groups in



Nepal

WORLD BOOK maps

M. Philip Kahl, Jr., Bruce Coleman Inc.

Kathmandu, Nepal's capital and largest city, lies at the foot of the Himalaya. Many-storied temples called *pagodas,* such as the ones shown here, line many of Kathmandu's streets.

northern Nepal. In most such cases, the woman marries two or more brothers. The children who are born of such marriages regard the oldest husband as their father and his brothers as uncles.

Illiteracy ranks as one of Nepal's most serious problems. For the country's literacy rate, see **Literacy** (table: Literacy rates for selected countries). Tribhuwan University is Nepal's only university. It includes a main campus in Kathmandu and many other campuses in the country.

About half of the people speak Nepali—the country's official language—as their native tongue. Most of the rest of the people use Nepali as a second language. Nepali is related to the languages of northern India. More than 50 other languages and dialects are spoken in the country.

Land and climate. Nepal has three principal regions: (1) the Himalaya, (2) the hills and valleys, and (3) the Tarai. Differences in altitude give each region a different climate. Each region also has its own kinds of plants and animals.

The Himalaya, in the north, covers much of Nepal. The mountains have long, harsh winters and short, cool summers. Steep rivers cut deep valleys through the snow-clad mountains of the Himalaya. Forests cover the mountains up to the altitude of about 12,000 feet (3,660 meters) above sea level. Only grasses, lichens, and moss can grow in the cold, dry air above this altitude.

Mountaineers in the Himalaya herd sheep. They also herd long-haired oxen called *yaks.* Some people claim that a mysterious creature called the *Abominable Snowman,* or *Yeti,* lives in the mountains.

The hills and valleys lie south of the Himalaya. The valleys have a cool climate, and rain falls heavily in summer. Winters are chilly but dry. Farmers on the hillsides and in the valleys raise many crops. The region's crops include corn, rice, millet, and wheat. The farmers of the hills and valleys tend herds of cattle, sheep, and goats. A wide variety of trees and bamboo grasses grow in thick forests in this region.

The Tarai lies in southern Nepal. It has fertile farmland. Farmers grow corn, jute, millet, mustard, rice, sugar cane, tobacco, and other crops. Livestock raised in the region includes cattle and water buffalo. The Tarai has a tropical climate. Its jungles and swamps provide a habitat for a variety of wild animal species, including crocodiles, elephants, deer, leopards, rhinoceroses, and tigers.

Economy of Nepal depends almost entirely on farming. Nepalese farmers attend small fairs and markets to trade their surplus crops for other items. Nepal has few railroads or paved roads. The lack of good transportation facilities makes large-scale trade difficult.

Roads link Nepal with India, Nepal's chief trading partner. Nepal exports carpets, clothing, rice, spices, and sugar. Principal imports include gasoline, kerosene, machinery, metals and metal products, and textiles.

Since the 1950's, large amounts of foreign aid have helped develop Nepal's economy. Several nations—including China, India, Switzerland, the United Kingdom, and the United States—have contributed money to Nepal. These funds have helped construct roads, maintain health centers, and start small industries. The Nepalese government spends hundreds of millions of dollars annually on development projects. About half of this money comes from foreign aid and loans.

Hundreds of thousands of tourists visit Nepal annually. Money spent by visitors from other countries has helped improve economic conditions in Nepal.

Nepal has deposits of coal, copper, gold, iron, and mica, but the country has few mines. Nepal's greatest natural resources are its forests and rivers. Some of its swift mountain currents have been harnessed to produce hydroelectric power, but most of the country still depends on firewood for cooking and heating.

History. Until the late 1700's, Nepal consisted of a number of small, independent kingdoms. About A.D. 400, the Kathmandu Valley, where the Nepalese capital is now located, came to be called Nepal. Through the centuries, bands of conquerors, nomads, and refugees moved into Nepal. They came from Central Asia, India, and Tibet and were the ancestors of the Nepalese.

In the mid-1700's, Prithwi Narayan Shah, a king from a small Nepalese kingdom called Gorkha, began a military campaign to unify the country. By the time of his death in 1775, he had conquered most of what is now Nepal. He took the title of king of Nepal, and his descendants

Malcolm Kirk from Peter Arnold

Porters on a mountain-climbing expedition carry heavy loads up a steep trail in Nepal. The country's rugged mountains attract thousands of climbers and hikers yearly.

have served as monarchs ever since.

In the early 1800's, Nepal fought a war against the United Kingdom. Nepal had attempted to expand its boundaries into northern India. The British East India Company, a trading corporation, controlled much of India at that time, and British soldiers guarded India's borders. The United Kingdom declared war on Nepal in 1814 after Nepalese troops attacked a British outpost.

The British expected an easy victory, but the Nepalese were accustomed to fighting in the mountains. Although the British initially suffered heavy losses, they defeated the Nepalese in 1816. After the war, the United Kingdom and Nepal became allies. The Gurkha soldiers of the Nepalese impressed the British, and the United Kingdom has recruited Gurkhas for its armies since that time.

In 1846, a political leader named Jung Bahadur seized control of Nepal's government. He took the honorary title of *Rana* and declared that a member of his family would serve as prime minister from then on. The Rana family totally controlled the government until 1951. During this period, the king had no power. The Ranas dominated the army, imprisoned their opponents, and even killed rivals whom they considered dangerous.

During the 1930's and 1940's, opposition to Rana rule grew. A revolution began in Nepal in 1950. The revolution overthrew the government and restored the monarchy to power under King Tribhuwan Shah in 1951.

During the early 1950's, the government attempted to create a democracy. King Tribhuwan died in 1955. He was succeeded by his son, Mahendra. Mahendra criticized the rivalry among political parties in democratic systems. In 1960, he declared that Nepal needed a political system that would suit its traditions. He dissolved the elected government and took over power. Political parties were banned. In 1962, he put into effect a constitution that established the panchayat system, in which most power is held by the monarch.

Under Mahendra's rule, the government stressed economic development, tourism, road construction, and hydroelectric power. Mahendra died in 1972, and his son, Birendra, succeeded him as king.

In 1979, many Nepalese staged violent demonstrations, in part to demand a more democratic government. In response to the demands, Birendra allowed a national vote on the government system. By a narrow margin, the voters chose to continue Nepal's system.

In 1990, violent demonstrations calling for more democracy broke out again. The king lifted the ban on political parties, and an interim government was formed. In November 1990, a constitution was approved that made Nepal a constitutional monarchy. In May 1991, democratic parliamentary elections were held in Nepal for the first time since the 1950's.

In 1996, Communist rebels began fighting to replace Nepal's constitutional monarchy with a Communist government. By the early 2000's, rebels controlled several districts and were active in much of the country. Both the rebels and the national security forces used ruthless violence and intimidation against the people of Nepal.

In 2001, King Birendra's son Dipendra killed the king and most of the royal family, then himself. Gyanendra, the king's brother, took the throne. Graham P. Chapman

Nephrite. See Jade.

Nephritis, *nih FRY tihs,* formerly called Bright's disease, is a general term for several inflammatory diseases of the kidneys. *Glomerulonephritis* is the disease most often called nephritis. It involves an inflammation of the *glomeruli* (filtering units) of the kidneys. The inflammation often reduces the amount of urine produced by the kidneys, causing waste products normally eliminated in the urine to accumulate in the body. Severe or persistent glomerulonephritis can cause serious, permanent damage to the kidneys.

Most cases of glomerulonephritis follow an infection of the throat or skin caused by certain types of the bacteria called *streptococci.* In some people, such infections apparently cause the body to become allergic to the tissues of the glomeruli. The glomeruli may suffer serious damage as a result. If this damage occurs rapidly, the condition is called *acute glomerulonephritis.* If the damage continues over a period of years, the condition is called *chronic glomerulonephritis.*

Acute glomerulonephritis occurs mostly in children. Symptoms include facial swelling, fever, headache, high blood pressure, vomiting, and blood and proteins in the urine. There is no specific treatment. Nearly all patients recover from their first attack of acute glomerulonephritis, but many have later attacks of the disease.

Chronic glomerulonephritis develops mostly in adults. In most cases, the specific cause is unknown. Many cases involve only mild symptoms so that a person may not even know that he or she has the disease. For some patients, treatment with medications can stop or even reverse the damage. But for many others, chronic glomerulonephritis causes progressive, incurable kidney damage. Advanced stages may lead to kid-

ney failure and a potentially fatal condition known as *uremia* (see Uremia). In order to prevent advanced uremia, physicians may connect the patient to a *dialysis machine,* which removes wastes from the patient's blood. Physicians may also treat chronic glomerulonephritis with *ambulatory dialysis,* in which the patient manually drains and replaces abdominal fluids. In certain severe cases of the disease, physicians may perform a kidney transplant to replace the damaged kidneys.

Laurence H. Beck

Nepotism, *NEHP uh tihz uhm,* is the practice of giving important political or business positions to members of one's family. The word *nepotism* comes from the Latin word for *nephew.*

Fountain of Neptune (1563-1567) by Giambologna in the Neptune Plaza in Bologna, Italy (Bridgeman Art Library)

Neptune was the Roman god of the sea. He was often portrayed holding a three-pronged spear called a *trident,* which he used to start and stop storms, smash rocks, and create earthquakes.

Neptune was the god of the sea in Roman mythology. He had power over the sea and seafaring. For example, he could cause—or prevent—storms at sea. Neptune resembled the Greek god Poseidon. Like Poseidon, he was also the god of earthquakes and horses.

The ancient Romans were a seafaring people and imported much of their food and other necessities by ship. As ruler of the sea, Neptune thus had an important role in their daily life. Sea travel was dangerous in ancient times, and Roman sailors prayed to Neptune for safe voyages. After their return, sailors often showed their gratitude by dedicating a valuable object to Neptune.

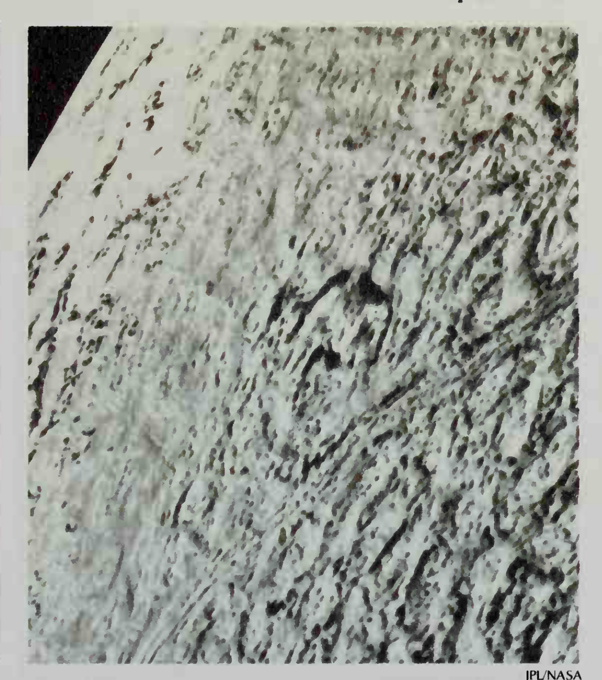
Neptune was the son of Saturn and Ops (called Cronus and Rhea by the Greeks). He married the sea nymph Amphitrite, and they had a son, Triton, who was half man and half fish. Triton played an important role in many ancient legends about the sea.

Neptune appears in a famous episode at the beginning of the *Aeneid,* an epic by the Roman poet Virgil. In this epic, Neptune calms a storm that had threatened to destroy the fleet of the Trojan hero Aeneas. Many ancient and modern seascapes feature Neptune, Amphitrite, and Triton. Artists portray Neptune as a man carrying a *trident* (three-pronged spear). Some show him riding in a chariot pulled by seahorses and accompanied by dolphins. Many fountains, notably the Trevi Fountain in Rome, include a statue of Neptune. One of the planets is named for him. Daniel P. Harmon

See also **Poseidon.**

Neptune is one of the two planets that cannot be seen without a telescope. The other is Pluto. Neptune is about 30 times as far from the sun as is Earth. Pluto is the only planet farther from the sun than Neptune. But every 248 years Pluto moves inside Neptune's orbit for about a 20-year period, during which it is closer to the sun than Neptune. Pluto last crossed Neptune's orbit on Jan. 23, 1979, and remained within it until February 11, 1999.

Neptune's diameter is about 30,500 miles (49,100 kilometers), or almost 4 times that of Earth. It is about 17 times as *massive* (heavy) as Earth, but is not so *dense* as Earth (see **Mass; Density**). Neptune has eight *satellites* (moons) and several rings around it.



Neptune travels around the sun in an *elliptical* (oval-shaped) orbit. Its mean distance from the sun is about 2,798,800,000 miles (4,504,300,000 kilometers). Neptune goes around the sun once about every 165 earth-years, compared to once a year for Earth. As Neptune orbits the sun, it spins on its *axis,* an imaginary line through its center. Neptune's axis is not *perpendicular* (at an angle of 90°) to the planet's path around the sun. The axis tilts about 30° from the perpendicular position (see **Planet** [illustration: The axes of the planets]). Neptune spins around once in about 16 hours and 7 minutes.

Surface and atmosphere. Scientists believe that Neptune is made up chiefly of hydrogen, helium, water, and *silicates.* Silicates are the minerals that make up most of Earth's rocky crust, though Neptune does not have a solid surface like Earth. Thick clouds cover Neptune's surface. Its interior begins with a region of heavily compressed gases. Deep in the interior, these gases blend into a liquid layer that surrounds the planet's central core of rock and ice. The tilt of its axis causes the sun to heat the Neptune's northern and southern halves alternately, resulting in seasons and temperature changes.

JPL/NASA

Bright blue clouds that surround Neptune consist mainly of frozen methane. Winds that carry these clouds may reach speeds up to 700 miles (1,100 kilometers) per hour.

JPL/NASA

The icy crust of Triton, Neptune's largest satellite, has ridges and valleys that were revealed in photographs taken by the U.S. space probe Voyager 2.

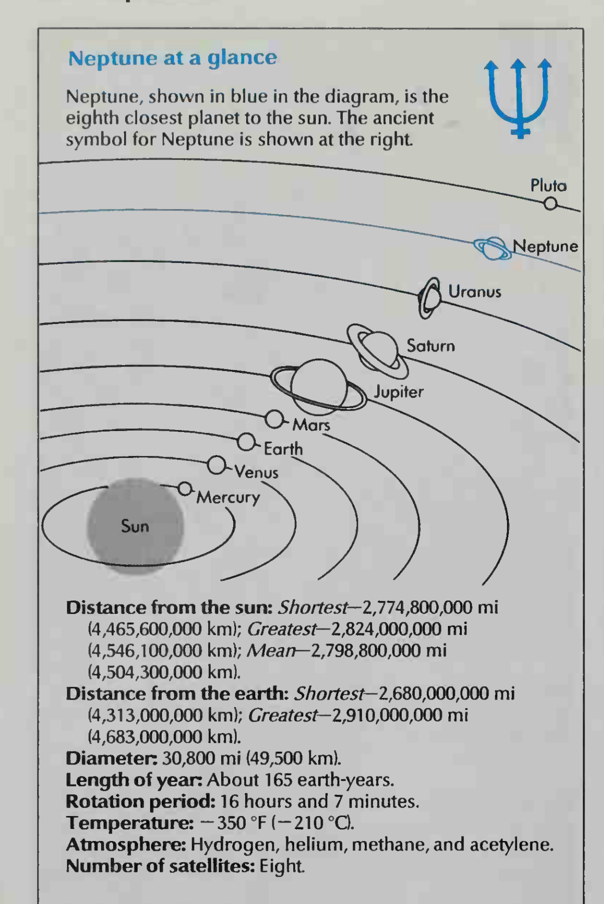
Neptune is surrounded by thick layers of clouds in rapid motion. Winds blow these clouds at speeds up to 700 miles (1,100 kilometers) per hour. The clouds farthest from Neptune's surface consist mainly of frozen methane. Scientists believe that Neptune's darker clouds, which lie below the clouds of methane, are composed of hydrogen sulfide.

In 1989, the Voyager 2 spacecraft found that Neptune had a dark area made up of violently swirling masses of gas resembling a hurricane. This area, called the Great Dark Spot, was similar to the Great Red Spot on Jupiter. But in 1994, the Hubble Space Telescope found that the Great Dark Spot had vanished.

Satellites and rings. Neptune has eight known satellites. Only two of them—Triton and Nereid—can be seen by telescopes on the earth. The other six satellites and several rings around the planet were discovered by Voyager 2 in 1989.

Triton, Neptune's largest satellite, is 1,681 miles (2,705 kilometers) in diameter and about 220,440 miles (354,760 kilometers) from Neptune. It is the only major satellite in the solar system that orbits in a direction opposite to that of its planet. Triton has a circular orbit and travels once around Neptune every six days. Triton may once have been a large comet that traveled around the sun. At some point, Neptune's gravity probably captured the comet, and it became a satellite of Neptune. Scientists have discovered evidence that volcanoes on Triton once spewed a slushy mixture of water and ammonia. This mixture is now frozen on Triton's surface. Triton has a surface temperature of −390 °F (−235 °C), the coldest known temperature in the solar system. Some volcanoes on Triton remain active, shooting crystals of nitrogen ice as high as 6 miles (10 kilometers) above the moon's surface.

Nereid is much smaller than Triton, measuring only about 211 miles (340 kilometers) across. It travels in a long, elliptical orbit at an average distance of 3,425,900 million miles (5,513,400 kilometers) from Neptune.



Neptune has three conspicuous rings and one faint ring. All of these rings are much fainter and darker than the rings of Saturn. They appear to consist of particles of dust. Neptune's outer ring is unlike any other planetary ring in the solar system. It has three curved segments that are brighter and denser than the rest of the ring. Scientists do not know why the dust is spread unevenly in the ring.

Discovery. Neptune was discovered by means of mathematics before being seen through a telescope. Astronomers had noticed that Uranus, which they thought was the most distant planet, was not always in the position they predicted for it. The force of gravity of some unknown planet seemed to be influencing Uranus.

In 1843, John C. Adams, a young English astronomer and mathematician, began working to find the location of the unknown planet. Adams predicted the planet

Satellites of Neptune

	Mean distance from Neptune		Diameter of satellite		Year of discovery
Designation	In mi	In km	In mi	In km	
Naiad	29,967	48,227	36	58	1989
Thalassa	31,115	50,075	50	80	1989
Despina	32,638	52,526	92	148	1989
Galatea	38,496	61,953	98	158	1989
Larissa	45,701	73,548	120	193	1989
Proteus	73,102	117,647	258	416	1989
Triton	220,440	354,760	1,681	2,705	1846
Nereid	3,425,900	5,513,400	211	340	1949

Neptune at a glance

Neptune, shown in blue in the diagram, is the eighth closest planet to the sun. The ancient symbol for Neptune is shown at the right.

Distance from the sun: *Shortest*—2,774,800,000 mi (4,465,600,000 km); *Greatest*—2,824,000,000 mi (4,546,100,000 km); *Mean*—2,798,800,000 mi (4,504,300,000 km).
Distance from the earth: *Shortest*—2,680,000,000 mi (4,313,000,000 km); *Greatest*—2,910,000,000 mi (4,683,000,000 km).
Diameter: 30,800 mi (49,500 km).
Length of year: About 165 earth-years.
Rotation period: 16 hours and 7 minutes.
Temperature: −350 °F (−210 °C).
Atmosphere: Hydrogen, helium, methane, and acetylene.
Number of satellites: Eight.

would be about 1 billion miles (1.6 billion kilometers) farther from the sun than Uranus. He completed his remarkably accurate work in September 1845. Adams sent it to Sir George B. Airy, the astronomer royal of England. However, Airy did not look for the planet with a telescope. Apparently, he lacked confidence in Adams.

Meanwhile, Urbain J. J. Leverrier, a young French mathematician unknown to Adams, began working on the project. By mid-1846, Leverrier also had predicted Neptune's position. He sent his predictions, which were similar to those of Adams, to the Urania Observatory in Berlin, Germany. Johann G. Galle, the director of the observatory, had just charted the fixed stars in the area where the planet was believed to be. On Sept. 23, 1846, Galle and his assistant, Heinrich L. d'Arrest, found Neptune near the position predicted by Leverrier. Today, both Adams and Leverrier are credited with the discovery. The planet was named for Neptune, the Roman sea god. In August 1989, the Voyager 2 spacecraft provided the first close-up views of Neptune and its satellites and rings. Bradford A. Smith

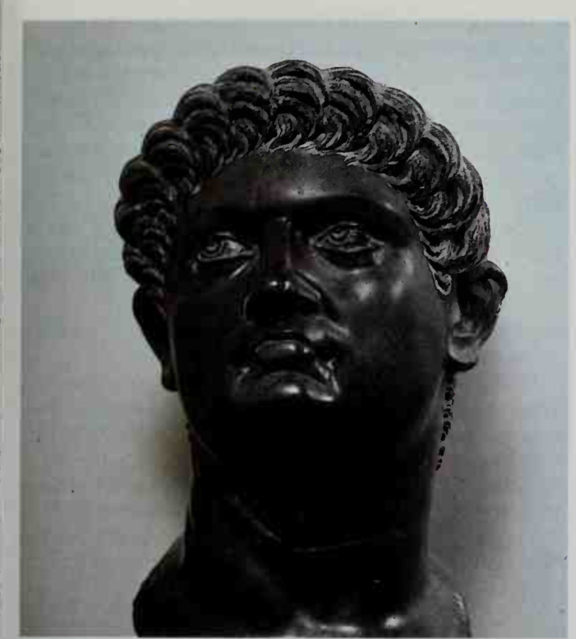
Neptunium, *nehp TOO nee uhm* (chemical symbol, Np), is an artificially created element. Its atomic number is 93. Its most stable isotope has an atomic weight of 237 and a half-life of 2 million years. Neptunium was discovered by Edwin M. McMillan and P. H. Abelson at the University of California in 1940. Neptunium was named for the planet Neptune. It follows uranium in the periodic table of the elements, just as Neptune follows Uranus in the solar system (see **Element, Chemical**). Neptunium was first produced by bombarding uranium with slow neutrons. Neptunium produced in this way is unstable and decays to form an isotope that can be used for nuclear fission. Scientists have created much neptunium in nuclear reactors and have studied its physical and chemical properties. Neptunium metal has a density of 20.25 grams per cubic centimeter at 20 °C. It melts at 639 °C. Richard L. Hahn

Nereids, *NIHR ee ihdz,* were 50 beautiful sea nymphs who attended the sea divinities Poseidon and Amphitrite. They were the daughters of the sea goddess Doris and of Nereus, called the Old Man of the Sea. The Nereids lived under the sea and surfaced to dance in the waves. Their leader was Thetis, mother of the hero Achilles. Other famous Nereids included Psamathe and Galatea. Nancy Felson

See also **Nereus; Andromeda.**



Nereus, *NIHR oos,* was a kindly old sea god in Greek mythology. The poets Homer and Hesiod called him the Old Man of the Sea. Like other sea deities, Nereus had the gift of prophecy and the ability to change shapes. He foretold the fall of Troy in the Trojan War. The Greek hero Heracles (Hercules in Latin) captured him while he slept and held him fast as he rapidly changed forms. After Nereus finally resumed his original shape, he told Heracles where to find the garden of the Hesperides. The hero then let him go. With the sea goddess Doris, Nereus fathered 50 lovely sea nymphs called the Nereids. See also **Hesperides; Nereids.** Nancy Felson

Neri, *NAIR ee,* **Saint Philip** (1515-1595), was the founder of the Oratorians, and a reformer of Rome during the Counter Reformation. Pope Gregory XIII recognized his group of priests as the Congregation of the Oratory in 1575. Neri, a popular leader, also won over cardinals and popes to his unusual methods of reform. He was born in Florence, Italy. Marvin R. O'Connell

Nero, *NEER oh* (A.D. 37-68), was a Roman emperor who reigned from A.D. 54 until his death 14 years later. His rule is best known for a fire that destroyed much of Rome in A.D. 64. Nero built the Golden House, a colossal palace, in the center of the burned-out area. There were rumors circulating that Nero had started the fire so that he could build the palace. However, Nero blamed the Christians, then an unpopular group in Rome, and persecuted them.

Nero was born in Antium. His given and family names were Lucius Domitius Ahenobarbus. His father, Gnaeus Domitius Ahenobarbus, was a nobleman. Nero's mother was Agrippina the Younger, the great-granddaughter of Emperor Augustus. Nero's father died when Nero was still a child, and Agrippina married Emperor Claudius in A.D. 49. Claudius adopted Nero as his eldest son, naming him Nero Claudius Caesar Drusus Germanicus. In A.D. 53, Nero married Octavia, Claudius's daughter by a previous marriage. The next year, Claudius died. Many historians believe that Agrippina poisoned him so that Nero could become emperor.

At first, Nero permitted two respected advisers to direct state affairs. These advisers were Seneca, a philosopher and writer, and Burrus, a military officer. However,

Bronze portrait bust of Nero, about A.D. 150; Uffizi Gallery, Florence, Italy (SCALA/Art Resource)

Emperor Nero, who ruled Rome from A.D. 54 to 68, ordered the death of many Christians and several of his own relatives.

Nero began to assume his own power in A.D. 59. That year, he had Agrippina murdered. In A.D. 62, Burrus died, and Seneca retired from political life. Soon afterward, Nero divorced Octavia and then had her killed so he could marry Poppaea Sabina. Poppaea was the former wife of a Roman military officer. Nero killed her a few years later. He also executed many Roman senators because they questioned his actions. These executions and Nero's scandalous life made him increasingly unpopular with the upper classes. A plan to overthrow Nero failed. As a result, more aristocrats were killed in A.D. 65.

Nevertheless, most of Rome's provinces were well governed and peaceful. Nero's military commanders put down rebellions in Britain and Judea and reasserted Rome's right to choose the king of Armenia.

Nero appreciated Greek civilization. He was a poet and actor and took an interest in architecture. In A.D. 66 and 67, Nero toured Greece and participated in games and festivals there. By then, military commanders in the provinces had begun to fear Nero's cruelty and wild suspicions. In A.D. 68, they revolted. Nero took his own life soon afterward. His last words were said to have been, "Alas, what an artist is dying in me." William G. Sinnigen

Neruda, *nay ROOD uh,* **Pablo,** *PAH bloh* (1904-1973), a Chilean poet, won the 1971 Nobel Prize for literature. Because he continually changed his approach to poetry, Neruda's work cannot be easily characterized. He was one of the great adapters of surrealism in Spanish-language verse, producing obscure, violent imagery and conveying a sense of universal chaos (see **Surrealism**). Neruda also experimented with making poetic expression as direct and simple as possible.

Neruda was born in Perral, Chile. His real name was Neftalí Reyes. He first gained recognition with the lyrical and romantic *Twenty Poems of Love and One Desperate Song* (1924). The two parts of *Residence on Earth* contain his poetry from 1925 to 1935. They show the poet at his most surrealistic. Although not all their symbols are comprehensible, their vision of disintegration and despair are unmistakable. Neruda showed a new desire to make art speak for oppressed members of society in *Third Residence* (1947) and *General Song* (1950). His most playful and eloquent poems appear in *Elemental Odes* (1954). Naomi Lindstrom

Nerval, *nehr VAL,* **Gérard de,** *zhay RAR duh* (1808-1855), was a French poet. His charm, odd behavior, periodic mental disorders, and mysterious suicide made him a hero typical of the romantic movement. Critics consider him a major visionary poet.

Nerval believed in *metempsychosis,* the passing of a soul at death from one body to another. In *Les Chimères* (1854), a collection of sonnets, this belief underlies many obscure references to the legendary past which contribute to the haunting beauty of the poems. His search for the eternal feminine ideal is reflected in the short stories of *Les Filles du Feu* (1854), notably in "Sylvie," a tale set in the Valois countryside. *Aurélia* (1855), a prose confession, begins with the phrase "Our dreams are a second life." It describes this "life," including the hallucinations Nerval suffered during his periods of insanity. He was born in Paris. Jean-Pierre Cauvin

Nerve. See **Nervous system.**

Nerve gas. See **Chemical-biological-radiological warfare.**

Nervi, *NEHR vee,* **Pier Luigi,** *pyehr loo EE jee* (1891-1979), was an Italian architect and engineer. His designs reflect his belief that practical industrial structures should be beautiful and elegant through simplicity of design. Nervi was trained as an engineer, and he felt that architectural beauty could be derived from mathematical calculations rather than from aesthetic considerations. Nervi became especially noted for his free and graceful use of reinforced concrete. He developed a number of new structural techniques that utilized concrete.

Nervi was born in Sondrio. His first major work was a stadium completed in Florence in 1932. It has stairways that dramatically curve out over open space. Nervi designed two concrete exhibition halls (1948-1950) in Turin. Both were largely prefabricated. Nervi's other buildings include two Sports Palaces designed for the 1960 Summer Olympic Games in Rome, and the Palace of Labor (1961) in Turin. For pictures of Nervi's designs, see **Rome** (picture: The Sports Palace) and the introduction to **Architecture.** Nicholas Adams

Nervous breakdown is a term often used to refer to anything from fatigue caused by overwork to a severe mental illness. The term has no precise medical meaning. Psychiatrists and others who study and treat mentally ill patients do not use the term. It is used by those who believe it is an accepted medical term, or who want to avoid using the term "mental illness." The original idea behind the term was that mental symptoms of a person were caused by a failure of the nerves to function properly. Paula J. Clayton

See also **Mental illness.**

Nervous system is an internal communications network that enables an animal to adjust to changes in its environment. Almost all animals, except the simplest kinds, have some type of nervous system.

Animals without a backbone have a nervous system that ranges from a simple net of nerves to a highly organized system of nerve cords and a primitive brain. In human beings and other animals with backbones, the nervous system consists of the brain, the spinal cord, and the nerves. This article deals mainly with the human nervous system.

The human nervous system—especially the highly developed brain—makes people different from all other animals. The human brain functions much like a complicated computer that enables people to speak, solve difficult problems, and produce creative ideas.

The nervous system provides pathways by which information travels from a person's surroundings to the brain. The brain then sends instructions to various muscles via other pathways so that the body can respond to the information. The nervous system also regulates internal functions, such as breathing, digestion, and heartbeat. All of a person's movements, sensations, thoughts, and emotions are products of his or her nervous system.

How the nervous system works

The nervous system is made up of billions of special cells called *neurons* or *nerve cells.* Cordlike bundles of neuron fibers are called *nerves.* The nerves form a network of pathways that conduct information rapidly throughout the body.

A person's reaction to a situation may take only an instant, but it involves many complicated processes within the nervous system. For example, what happens in the nervous system of a person who sees a wild tiger and, an instant later, turns and runs away?

Specialized neurons called *receptors* are located in the ears and eyes and the other sense organs of the body. The receptors translate events in a person's surroundings—such as the sight of a tiger—into nerve messages, which are known as *impulses.* Nerve impulses travel along nerve fibers at speeds of 3 to 300 feet (0.9 to 90 meters) per second.

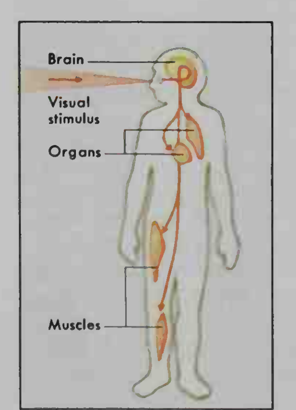
The receptor cells in the eyes respond to light rays that reflect off the tiger and translate the rays into a pattern of nerve impulses. These impulses then travel through neurons called *sensory neurons* and *association neurons.* The sensory neurons carry information from receptors in the sense organs to the association neurons, which are located in the brain and the spinal cord.

The neurons in the brain receive the impulses, analyze and interpret the message, and decide what action should be taken. A message consisting of the sight of a wild tiger is, of course, interpreted as danger. The person's brain immediately sends out a message—"Run!"—in the form of nerve impulses.

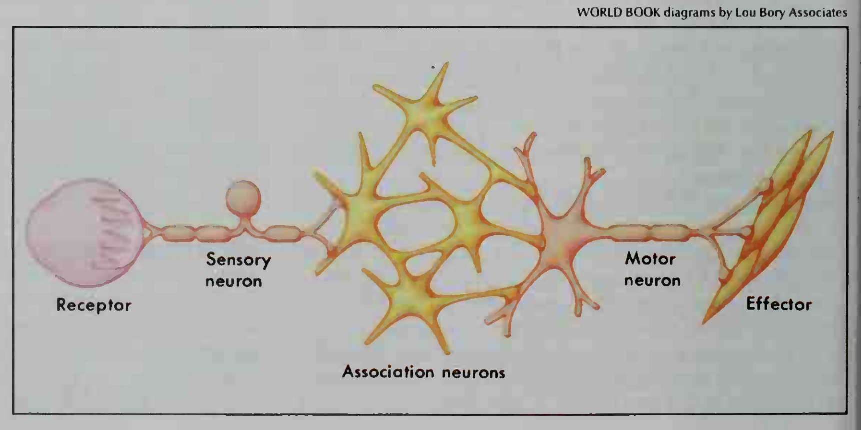
Next, the impulses travel through *motor neurons.* These nerve cells carry messages from the brain to the muscles and glands, which are called *effectors.* The effectors carry out the brain's instructions. Thus, the leg muscles respond and the person runs away. At the same time, the brain sends messages to various other parts of the body. For example, it sends messages to the heart to beat faster and send more blood to the leg muscles.

Divisions of the nervous system

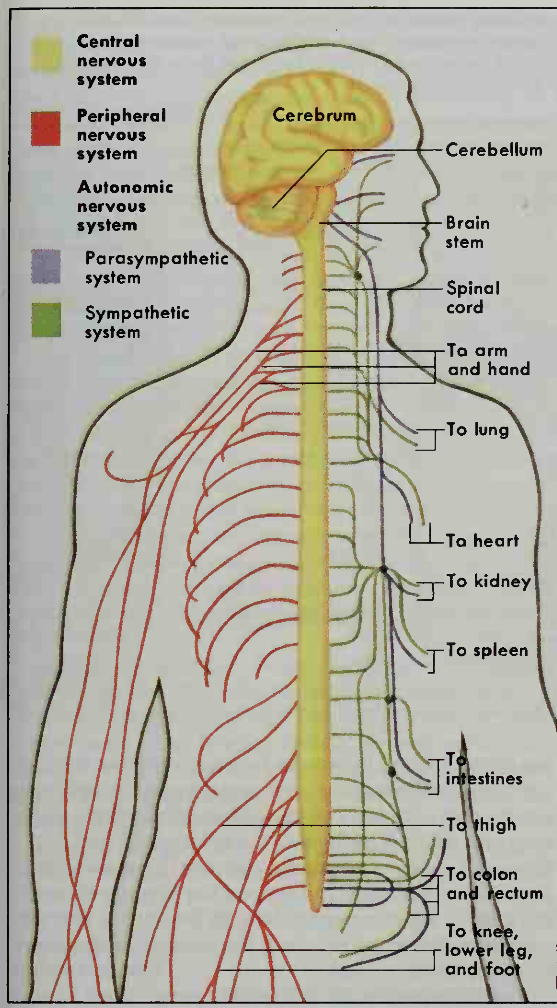
The nervous system has three main parts, the *central nervous system,* the *peripheral nervous system,* and the *autonomic nervous system.* Each of these parts has special functions.



The central nervous system functions as a "main switchboard" that controls and coordinates the activities of the entire nervous system. The central nervous system consists of the *brain* and the *spinal cord.*



The brain is an extremely complicated organ. It consists of three principal parts, the *cerebrum,* the *cerebellum,* and the *brain stem.* This article provides basic information about the brain. For more detailed information on the brain and how it works, see the *World Book* article on **Brain.**



The cerebrum makes up about 85 per cent of the brain and is the most complex part. It is above the cerebellum and the brain stem and almost surrounds them. Human beings have a highly developed cerebrum that directs their hearing, sight, and touch and their ability

How the nervous system works The nervous system enables us to adjust to changes in our surroundings. Such *neurons* (nerve cells) as the *receptors* in the eyes translate information from the environment into nerve impulses. *Sensory neurons* carry the impulses to *association neurons* in the brain and spinal cord. *Motor neurons* then carry instructions from the brain to muscles, internal organs, and other body parts.

WORLD BOOK diagrams by Lou Bory Associates

WORLD BOOK diagram by Lou Bory Associates

The human nervous system has three main parts: (1) the *central nervous system,* (2) the *peripheral nervous system,* and (3) the *autonomic nervous system,* which consists of *sympathetic* and *parasympathetic* divisions. This simplified diagram shows only major nerves. It illustrates peripheral nerves only on the left side of the figure and autonomic nerves only on the right.

to think, use language, and feel emotions. The cerebrum is also the center of learning.

The cerebellum, which is about the size of an orange, is slightly above the brain stem. It helps maintain the body's sense of balance and coordinates muscular movements with sensory information.

The brain stem is a stalklike structure that is connected to the spinal cord at the base of the skull. The brain stem contains neurons that relay information from the sense organs. Many neurons that regulate automatic functions, such as balance, blood pressure, breathing, and heartbeat, are also in the brain stem.

The spinal cord is a cable of neurons that extends from the neck about two-thirds of the way down the backbone. The backbone surrounds and protects the spinal cord. The spinal cord contains pathways that carry sensory information to the brain. It also has pathways that relay commands from the brain to the motor neurons.

The peripheral nervous system carries all the messages sent between the central nervous system and the rest of the body. The peripheral nervous system consists of 12 pairs of nerves that originate in the brain, plus 31 pairs of nerves of the spinal cord. These cranial and spinal nerves serve as "telephone wires" that carry messages to and from every receptor and effector in the body.

The autonomic nervous system is a special part of the peripheral nervous system. The autonomic nervous system regulates such automatic bodily processes as breathing and digestion without conscious control by the brain. This constant regulation enables the body to maintain a stable internal environment.

The autonomic nervous system has two parts, the *sympathetic system* and the *parasympathetic system.* The sympathetic system responds to the body's needs during increased activity and in emergencies. The actions of the sympathetic system include speeding up the heartbeat, sending additional blood to the muscles, and enlarging the pupils of the eyes to use all available light.

The parasympathetic system, in general, opposes the actions of the sympathetic system. The parasympathetic system's functions include slowing down the heartbeat, diverting blood from the muscles to the stomach and intestines, and contracting the pupils of the eyes. The balance of activity between the two systems is controlled by the central nervous system.

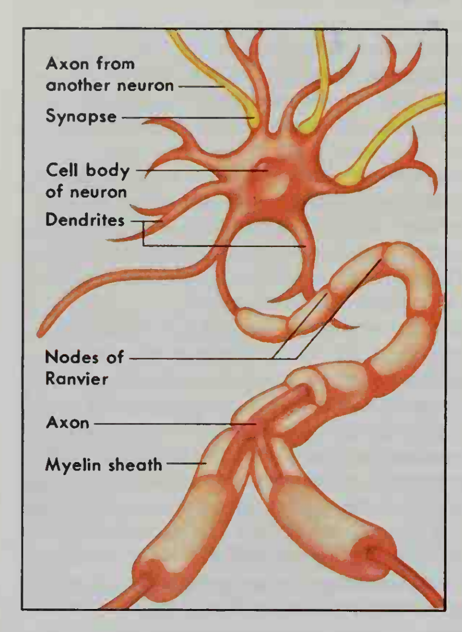
Parts of a neuron

A neuron has three basic parts, the *cell body,* the *axon,* and the *dendrites.* A thin *nerve membrane* surrounds the entire cell.

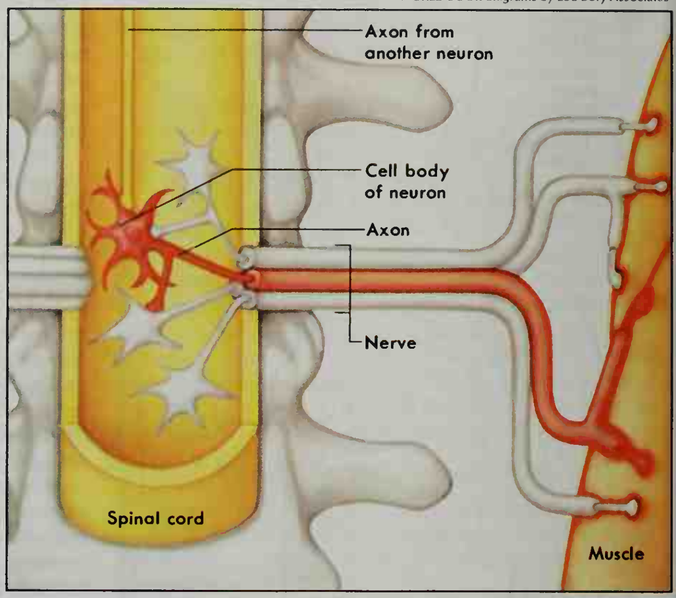
The cell body of a neuron is a ball-shaped structure about $\frac{1}{1000}$ of an inch (.025 millimeter) wide. Each neuron cell body is a center for receiving and sending nerve impulses. The cell body is also responsible for making proteins and using energy for the maintenance and growth of the nerve cell.

The vast majority of neuron cell bodies are within the central nervous system, where incoming messages are combined and outgoing messages are produced. The few neuron cell bodies outside the central nervous system are grouped into clusters called *ganglia.* The best-known ganglia are in the autonomic nervous system.

The axon, also called the *nerve fiber,* is a tubelike extension of a neuron cell body. The axon is specialized to carry messages. An axon of one neuron may have enough branches to make contact with as many as 1,000 other neurons.



Most axons in the central nervous system are less than $\frac{1}{25}$ of an inch (1 millimeter) long. However, many axons in the peripheral nervous system are longer, and some are much longer. For example, the axons that extend from the spinal cord to the muscles in the feet may be 30 to 40 inches (76 to 100 centimeters) long.



The structures commonly called *nerves* are actually bundles of axons lying next to one another in a cordlike formation. Nerves can be made up of the axons of motor neurons or sensory neurons, or of both.

Some axons are covered by a sheath of a white, fatty substance called *myelin.* The myelin increases the speed

Neurons and nerves A neuron, *left,* has three basic parts. The *cell body* serves as the control center for the cell's activities. The *axon* is a tubelike extension that carries messages. The *dendrites* are shorter extensions specialized to receive messages. A nerve, *right,* consists of a cordlike bundle of axons from several neurons. The nerve shown runs from the spinal cord to a muscle.

WORLD BOOK diagrams by Lou Bory Associates

of impulses along the axons. Myelin also causes the distinction between the *gray matter* and *white matter* in the nervous system. Gray matter consists largely of *unmyelinated axons* (axons without myelin sheaths) and neuron cell bodies. White matter is made up mostly of axons that have white sheaths of myelin. Myelin is formed in the peripheral nervous system by *Schwann cells,* which are special supporting cells that surround the axons. In the central nervous system, supporting cells called *glia* produce myelin.

The dendrites of a neuron are branching, tubelike extensions of the cell body that form a pattern resembling the limbs of a tree. Most neuron cell bodies have about six main dendrites, each of which is two or three times as thick as the axon of the cell. The distance between the cell body and the tips of the dendrites is about $\frac{1}{50}$ of an inch (0.5 millimeter).

Dendrites are specialized structures for receiving impulses, mostly from the axon of another neuron. Dendrites and axons do not quite touch each other. In almost all cases, they are separated by an extremely narrow space called the *synaptic cleft,* over which nerve impulses are transmitted. These places where one neuron communicates with another are called *synapses.*

How messages are routed

Simple pathways. Much of the work of the nervous system depends upon established pathways between neurons. These pathways are called *neural circuits.* The simplest kind of neural circuit is a *reflex.* A reflex is an automatic and involuntary response to a stimulus. Simple reflexes do not involve the brain. Impulses in a reflex action follow a simple pathway that goes through the spinal cord and links a receptor and an effector.

One of the simplest reflexes is the *knee jerk reflex.* A tap on the tendon below the kneecap stretches the muscle there, and this action stimulates special receptors to produce an impulse. The impulse travels through a sensory neuron, over an axon to the spinal cord, and through a synapse to a motor neuron. There, a second impulse is generated. The second impulse travels over the axon of a motor neuron back to the muscle that was stretched. The impulse causes the muscle cells to contract and the leg to jerk.

Complex pathways. Many reflexes are more complicated. They involve at least one association neuron between the sensory and motor neurons. The association neuron, in turn, may be connected with many complex neural pathways, some of which may lead to the brain. A common but complex reflex is involved in withdrawing from a painful stimulus. For example, if a person steps on a sharp object, the immediate response is to lift the foot. In addition, association neurons stimulate the muscles of the other leg to adjust and maintain balance. Interconnecting neural pathways to the brain also may be stimulated so that the person becomes aware of what has happened.

Reflexes alone cannot account for the vast number and variety of actions performed by human beings. People, as well as some other kinds of animals, can learn new behavior patterns. Voluntary muscular movements necessary for learning new skills travel along complex nerve pathways that extend from the brain throughout the body. Complicated actions, such as riding a bicycle or walking, eventually can be performed without constant, conscious control after they have been learned.

How neurons carry impulses

During the 1800's, scientists discovered that nerve impulses involve electrical charges. They assumed a nerve

impulse was simply an electric current flowing through nerves. By the 1900's, researchers had learned that different concentrations of certain ions in neurons and in their surrounding fluids create a potential electrical charge. It was also learned that nerve cell membranes have pores that allow only certain substances to pass through. Scientists then theorized that a nerve impulse was an electrochemical process controlled by the nerve cell membrane.

In the 1930's, researchers developed techniques to test the *membrane theory of nerve conduction,* which is the theory discussed in this section. This theory is the accepted explanation of how neurons carry impulses.

The beginning of an impulse. A nerve cell membrane has special protein molecules that control the opening and closing of its pores. When at rest, the membrane keeps the concentration of sodium ions in the neuron very low. The membrane also keeps the concentration of potassium ions and negative organic ions much higher in the cell than in the surrounding fluids. These differences in ion concentration make the inside of the neuron more negative than the outside, and so the membrane is said to be *polarized.* The resulting voltage difference across the membrane is called the *resting potential.*

A chemical, electrical, or mechanical stimulus applied to a neuron can affect the membrane's porosity and change the resting potential. The stimulus can cause the membrane's pores to open and allow more sodium ions into the cell. The increase in sodium ions makes the inside of the cell positively charged, and this voltage change is called a *depolarization.*

When a stimulus causes a neuron to depolarize, the neuron is said to *fire.* The firing is the start of a nerve impulse. A stimulus must be of a certain intensity, called the *threshold voltage,* for a neuron to fire.

All impulses from a particular neuron have the same size and duration, no matter how large the stimulus that caused the neuron to fire. The fact that neurons fire at maximum strength or not at all is called the *all-or-nothing phenomenon.* The brain probably detects the intensity of a stimulus by the frequency of impulses generated and the number of nerve fibers stimulated.

Conduction along the axon. The inside of an axon is filled with a solution that can conduct an electric charge. Depolarizations in one area of an axon spread through the solution to neighboring areas along the axon. This wave of depolarizations is called an *action potential.*

If the axon of a neuron has no myelin sheath, the nerve impulse sweeps continuously along the axon, like fire along a firecracker fuse. But in a myelinated axon, nerve impulses can occur only at the *nodes of Ranvier.* The nodes of Ranvier are areas along an axon where the myelin sheath is interrupted at regular intervals. The impulse hops from node to node.

Transmission across synapses. Certain chemicals, called *neurotransmitters,* transmit nerve impulses across synapses. When an impulse reaches the end of an axon, a neurotransmitter is released into the synaptic cleft. The neurotransmitter moves to the dendrites of the next nerve cell and causes certain pores of the nerve membrane to open. Ions move through these pores, and a voltage change, called a *postsynaptic potential,* results.

The postsynaptic potential is either *excitatory* or *inhibitory.* An excitatory postsynaptic potential spreads to the axon of a nerve cell and tends to produce another action potential. An inhibitory postsynaptic potential tends to prevent the axon from producing another ac-

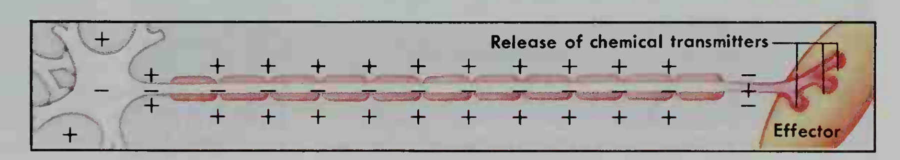
Transmission of a nerve impulse

The transmission of a nerve impulse is an electrochemical process. Most experts believe the neuron membrane controls this process by selectively allowing ions to enter and leave the cell. These diagrams show how a motor neuron carries a message from an association neuron to an effector.

WORLD BOOK diagrams by Lou Bory Associates

A resting neuron is *polarized*—that is, its inside is more negative than its outside. The membrane maintains the polarity by restricting the flow of ions in and out of the cell.

Positive charge
Negative charge



The impulse begins when neurotransmitters from the association neuron change the porosity of the motor neuron's membrane. This change results in depolarization.

Impulse arriving on association neuron
Depolarization of cell body of motor neuron

The impulse spreads down a myelinated axon as the depolarization hops from one node of Ranvier to the next. The impulse shown has gone nearly halfway down the axon.

Direction of impulse →
Nodes of Ranvier
Depolarization

Chemical transmitters are released by specialized structures when the impulse gets to the neuron's end. These chemicals stimulate the effector, in this case a muscle.

tion potential. Not every impulse that reaches a synapse is transmitted to the next neuron. The synapses thus help regulate and route the constant flow of nerve impulses throughout the nervous system.

Disorders of the nervous system

The nervous system can be damaged by injury and disease. Axons in the central nervous system cannot regrow after being damaged, but nerves in the peripheral nervous system may recover. Severely damaged nerve cells that die cannot be replaced.

Most neurons that perform a specific job are grouped together in the brain. Because of this grouping arrangement, called *localization of function,* damage to one area of the brain may affect only certain abilities and leave others intact. In some cases, undamaged areas of the brain gradually assume control of functions lost when another area of the brain was damaged. This action is called *recovery of function.*

The most common serious disorder of the nervous system is *stroke.* A stroke occurs if the blood supply to a certain area of the brain is cut off, resulting in the death of nerve cells. Stroke victims may lose the ability to perform functions controlled by the damaged area of the brain, such as speaking or moving a limb. Stroke victims may eventually recover some lost functions. But if respiration or some other vital function is affected, a stroke can be fatal.

The most common infectious diseases that affect the nervous system are mild virus infections that last only a few days and may produce headaches. More serious infectious diseases, such as *encephalitis* and *meningitis,* are caused by certain bacteria, viruses, or other microbes. Encephalitis is an inflammation of the brain, and meningitis is an inflammation of the membranes covering the brain and the spinal cord. See **Encephalitis; Meningitis.**

The cause of *multiple sclerosis,* a disease of the nervous system, is not known. Multiple sclerosis causes axons in various areas of the central nervous system to lose their myelin sheaths. As a result, these axons cannot conduct nerve impulses properly.

Another disorder of the nervous system is *epilepsy.* Victims of epilepsy suffer seizures that can cause muscle convulsions and a change in, or loss of, consciousness. An epileptic seizure occurs if most of the neurons in one area of the brain produce bursts of impulses at the same time. Physicians prescribe drugs to reduce the number of seizures or to prevent seizures from occurring at all.

Before the development of vaccines to prevent *poliomyelitis,* this virus disease of the nervous system was widespread. The polio virus can destroy motor neurons in the spinal cord and brain stem, leading to paralysis in some cases.

Some disorders of the nervous system can lead to mental illness or mental retardation. For information about these conditions, see the articles on **Mental illness** and **Mental retardation.**

The nervous system in other animals

In vertebrates. All vertebrates, including other mammals, as well as amphibians, birds, fish, and reptiles, have nervous systems much like the human nervous system. The neurons that make up the nervous systems of these animals are about the same size and shape as human neurons.

The size of a specific area of the brain may indicate the importance of the function of that area for the animal. For example, dogs have a larger and better developed area for smell than do human beings. In contrast, human beings have a larger and more highly developed *cerebral cortex* than other animals. The cerebral cortex is the outer surface of the cerebrum, where such complicated skills as delicate motor control and the use of language are coordinated.

In invertebrates. Most species of invertebrates that consist of more than one cell have some sort of nervous system. Many of the neurons of these animals are larger than human neurons. In hydras and some other simple invertebrates, the nervous system may be a *nerve net,* in which nerve cells are spread throughout the organism. There is no distinction between axons and dendrites in nerve net systems, and impulses travel in all directions from the point of stimulation.

Other invertebrates, including worms and insects, have more complicated, centralized nervous systems. These systems consist largely of concentrations of neurons that form a nerve cord. Ganglia along the cord serve as centers for organizing and integrating various activities of the animals. Clusters of ganglia in the front end of the body act as a primitive "brain." Many insects also have such ganglia in the thorax region. These ganglia coordinate motor activities. The mechanisms of nerve impulses and synaptic potentials in higher invertebrates are the same as those in the human nervous system. Charles F. Stevens

Ness, Eliot (1903-1957), was an American crime fighter. He became known during the late 1920's and early 1930's as a special agent in the Prohibition Bureau of the United States Department of Justice. Ness led a group of law enforcement officers against Chicago gangster Al Capone and his bootlegging activities. Ness's group earned the nickname "the Untouchables" because, unlike many other public officials of the time, they could not be bribed or frightened by mobsters.

Ness was born in Chicago. He graduated from the University of Chicago in 1925. He joined the Justice Department as a special agent in 1928 and soon was appointed to lead an elite squad created to enforce the prohibition law. For more than two years, Ness and his

team of about 10 Untouchables raided Capone's bootlegging operations. Ness's squad seized barrels of illegal liquor, and beer delivery trucks, stills, and other equipment.

From 1935 to 1942, Ness acted as director of public safety in Cleveland, where he cleaned up corruption in the city's police force. From 1942 to 1945, during World War II, he was director of the federal Social Protection Program, which was set up to handle certain public health issues on military bases. In 1945, Ness became a business executive. In 1947, he ran for mayor of Cleveland but was defeated. George T. Felkenes

Nest is a place an animal prepares for raising its young. See **Animal** (Animal homes and communities); **Ant** (Nests); **Bee** (The honey bee colony); **Bird** (Building a nest); **Hornet; Squirrel** (Obtaining shelter); **Wasp.**

Nestor. See **Messenia.**

Net is an open fabric. It is produced by knotting or looping together yarns, cords, wires, or other materials so that there are spaces left between the points where the material intersects. Most nets are made of cotton, nylon, or polyester, but some nets are made of silk.

There are many kinds of nets, and they have a wide variety of uses. Such household items as curtains, hammocks, tablecloths, and bedspreads are made of net. Many sports, including tennis, volleyball, basketball, hockey, and soccer, feature nets. A type of light, fine net called *tulle* is used in ballet costumes and in veils.

Cargo is often loaded onto ships by means of heavy nets. Heavy nets also play an important role in the fishing industry. Some fishing nets weigh 10,000 pounds (4,500 kilograms) and are 2,000 feet (600 meters) long.

Nets were first made about 13,000 years ago. In the mid-1700's, nets were produced on warp-knitting machines. These devices knit lengthwise stitches and create a flat fabric. Today, most nets are made on bobbinet machines or raschel knitting machines. Christine W. Jarvis

Netanyahu, *neh tahn YAH hoo,* **Benjamin** (1949-), a Likud Party politician, was prime minister of Israel from 1996 to 1999. That year, he was defeated in his bid for reelection by Ehud Barak, the leader of the Labor Party. After the election, Netanyahu resigned as Likud leader, a position he had held since 1993.

Netanyahu criticized the peace agreements between Israel and the Palestine Liberation Organization (PLO). These agreements, reached in the early and middle 1990's, provide for Palestinian self-rule in the Gaza Strip and West Bank, territories Israel had occupied since 1967. Netanyahu claimed that the agreements did not include enough provisions for Israel, such as guaranteed security and allowance for its population growth.

Reuters/Archive Photos
Benjamin Netanyahu

Under Netanyahu, Israel's peace negotiations with the PLO stalled. Netanyahu especially angered Palestinians with his decision to expand Israeli West Bank settlements and to build new Israeli housing in East Jerusalem.

Netanyahu, whose first name is sometimes spelled Binyamin, was born in Tel Aviv. He served in the Israel Defense Forces from 1967 to 1972. He then studied at the Massachusetts Institute of Technology, where he received a master's degree in management in 1976. From 1984 to 1988, he was the Israeli ambassador to the United Nations. He was elected to the Knesset (Israeli parliament) in 1988 and served as deputy minister of foreign affairs from 1988 to 1991. Bernard Reich

Amsterdam, the capital of the Netherlands, is crisscrossed by canals. Canals serve as waterways throughout the Netherlands and help drain the country's low-lying land.

Netherlands

Netherlands is a small country on the North Sea in northwestern Europe. It is bordered by Belgium and Germany. The Netherlands is often called *Holland,* but this name officially refers only to the western part of the country. The people of the Netherlands call themselves *Nederlanders.* They are also known as the *Dutch.*

"God created the world, but the Dutch created Holland," according to an old Dutch saying. More than two-fifths of the country's land was once covered by the sea, or by lakes or swamps. The Dutch "created" this land by pumping out the water. These drained areas, called *polders,* became some of the richest farmlands of the Netherlands.

To make a polder, the Dutch build a dike around the area to be drained of water. The water is then pumped into a series of drainage canals. Windmills were once used to run the pumps, but electric motors have replaced most of them. Most polders are below sea level, and they collect excess water through seepage. As a result, pumping must continue after the polders are built.

Jan de Vries, the contributor of this article, is Professor of History and Economics at the University of California at Berkeley.

The Zuider Zee (pronounced *ZY duhr ZAY),* once a large inlet of the North Sea, was cut off from the sea in 1932 by a dike 20 miles (32 kilometers) long. This development changed the Zuider Zee into a freshwater lake called the IJsselmeer *(EYE suhl MEHR).* Much of the lake was then drained to make several large polders. This project added 637 square miles (1,650 square kilometers) of land for new farms and cities. The Netherlands gained an entire new province, Flevoland *(FLEE voh lahnt).*

The people of the Netherlands have great pride in their long battle against the sea. Because their country is one of the most densely populated countries in the world, they take extreme care to protect their hard-won land and to plan wisely the use of every acre. Several times during their history, however, the Dutch have opened the dikes and flooded the land to save their country from invaders.

Most of the Netherlands is flat, though it has some uplands. Many canals cut through the country. They not only drain the land but also serve as waterways.

Dairy farming is the most important form of agriculture in the Netherlands. The processing of dairy products is a major branch of Dutch manufacturing.

The country's rulers have included the Romans, a Germanic people called the Franks, the Spanish, and the French. The Dutch declared independence from Spain in 1581, and Spain recognized their independence in

1648. In 1815, the Netherlands became an independent kingdom united with Belgium. The two countries separated in 1830, when Belgium declared its independence.

The Dutch experienced a period of great prosperity and power—a Golden Age—during the 1600's. At that time, the country was the world's leading sea power, and it ruled a great colonial empire. Amsterdam was an important trading center, and Dutch businesses thrived. The Golden Age was also a time of cultural achievement, especially in painting.

Government

The Netherlands is a constitutional monarchy. It has a democratic government that is based on a constitution. Citizens aged 18 and older may vote.

National government. A king or queen is the country's head of state, but the monarch's duties are mostly ceremonial. The monarch signs all bills that are passed by the parliament and appoints government officials upon the advice of various government bodies.

Dutch monarchs, unlike those of other countries, are not crowned. Instead, they go through a ceremony called *investiture,* in which power is given to them by the people. This practice is based on a medieval tradition. In the Middle Ages, new leaders traveled from town to town in their realm. They asked for oaths of allegiance from local authorities and, in return, promised to respect the rights of the townspeople. The investiture takes place in Amsterdam, the official capital. Another city, The Hague *(hayg),* is the seat of government.

A prime minister, appointed by the monarch, heads the government. The prime minister selects members of a Cabinet to run the government departments. If the Cabinet and the parliament cannot agree, either the Cabinet resigns, or the parliament is dissolved and a new election is held.

The parliament of the Netherlands, the States-General, consists of two houses. The First Chamber has 75 members, who are elected to four-year terms by the legislatures of the country's provinces. The Second Chamber proposes new laws. It has 150 members, who are elected to four-year terms by the people. The members are chosen under a system called *proportional representation.* This system gives each political party a share of seats in the Second Chamber according to its share of the total votes cast.

Local government. The Netherlands is divided into 12 provinces, each governed by a commissioner and a council. The monarch appoints the commissioner. Council members are elected by the people to four-year terms. The number of council members varies according to population. The provinces are made up of *municipalities.* Each municipality has an elected council and an executive called a *burgomaster,* who is appointed by the monarch.

Politics. The largest political parties include two left-wing groups called Democrats 66 and the Labor Party, a centrist party called the Christian Democratic Appeal, and the right-wing People's Party for Freedom and Democracy (also called the Liberal Party). There are also many small parties. No party has held a majority of seats in the Second Chamber since 1945, when World War II ended. Therefore, all governments are formed by party *coalitions* (partnerships).

Courts. The court system in the Netherlands consists of subdistrict courts, district courts, courts of appeal, and the Supreme Court. The monarch appoints all judges.

Armed forces. The Netherlands has an army, a navy, and an air force. About 75,000 men and women serve in the country's armed forces.

The Kingdom of the Netherlands. The Netherlands is part of a larger political unit called the Kingdom of the Netherlands. The kingdom also includes the Netherlands Antilles—two groups of islands in the Caribbean Sea—and the island of Aruba, also in the Caribbean. Both the Netherlands Antilles and Aruba have an appointed governor and a Council of Ministers headed by a prime minister. Each Council of Ministers is responsible to a one-house legislature, whose members are elected by the islanders.

People

About 40 percent of the people of the Netherlands live in two coastal provinces—North Holland and South Holland. In these provinces are the three largest cities—Amsterdam, Rotterdam, and The Hague.

Ancestry. Most of the people in the Netherlands are of Dutch ancestry. The largest non-Dutch groups in the country include people from Indonesia, Morocco, Suriname, and Turkey.

Language. Dutch is the official language of the Netherlands. The Dutch language belongs to the Germanic language group. The people of the northern province of Friesland *(FREEZ lahnt)* speak Frisian *(FRIHZH uhn),* another Germanic language. Most people of the Netherlands also speak English, and many speak French or German as well.

Way of life

The Netherlands is one of the most densely populated countries in the world. Nearly half of this small country lies below sea level, so the Dutch must carry on a continuous battle against the sea. Life in this environment has given the Dutch a practical, matter-of-fact outlook. To make the best use of their limited land and avoid overcrowding, the Dutch have developed a highly organized society. Neatness and self-control are prized. The Dutch tend to frown on extravagance and displays of wealth.

Although public life in the Netherlands is highly organized, there is a great deal of freedom in private life. The Dutch value personal privacy. They are also known for their good fellowship, called *gezelligheid (guh ZEHL ihk hyt).* This cozy friendliness among close friends and relatives is most frequently found at gatherings celebrating such occasions as birthdays and anniversaries. The Dutch are also interested in foreign countries, and many of them travel and work outside the Netherlands.

City life. For centuries, the Netherlands has been one of Europe's most urbanized regions. Nearly all Dutch cities were founded in the Middle Ages. The historic centers of these cities still have many shops and business and government offices. Public transportation is readily available, including subways and streetcars in the large cities.

Most city dwellers live in modern apartments and row houses. Because of high land prices, the cities have few single-family houses. The older residential sections of

Netherlands in brief

General information

Capital: Amsterdam.
Seat of government: The Hague.
Official language: Dutch.
Official name: Koninkrijk der Nederlanden (Kingdom of the Netherlands)
National anthem: "Wilhelmus van Nassouwe" ("William of Nassau").

Largest population centers: (1994 official estimates)

Cities	Metropolitan areas
Amsterdam (724,096)	Amsterdam (1,100,120)
Rotterdam (598,521)	Rotterdam (1,074,387)
The Hague (445,279)	The Hague (695,217)
Utrecht (234,106)	Utrecht (545,796)

The Dutch flag dates from about 1630. Until then, an orange stripe was at the top instead of a red one.

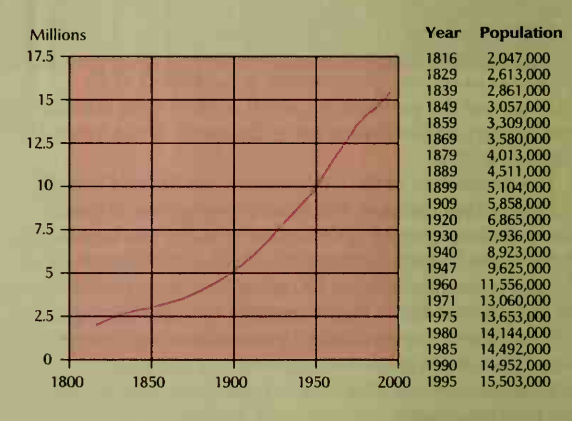
The coat of arms has old symbols of the Dutch royal family. The sword and arrows represent strength in unity.

Land and climate

Land: Netherlands is on the North Sea in northwestern Europe. It is bordered by Belgium and Germany. Most of the Netherlands is flat, though it has some uplands. Part of the country is made up of *polders,* land below sea level that was once covered by water. The Dutch built dikes around these areas and drained the water.

Area: 16,033 mi² (41,526 km²), including 2,929 mi² (7,587 km²) of inland water. *Greatest distances*—north-south, 196 mi (315 km); east-west, 167 mi (269 km.) *Coastline*—228 mi (367 km).
Elevation: *Highest*—Vaalser Berg, 1,053 ft (321 m) above sea level. *Lowest*—Prins Alexander Polder, 22 ft (6.7 m) below sea level.

Climate: The Netherlands has a mild, damp climate, with moderately warm summers and gentle winters. Temperatures average from 60 to 65 °F (16 to 18 °C) in summer, and a little above 30 °F (−1 °C) in winter. Extremely hot or cold temperatures are rare. Summer is the wettest season, though precipitation is fairly evenly distributed throughout the year. Most regions of the country receive about 25 to 30 inches (63 to 76 centimeters) of precipitation a year.



Government

Form of government: Constitutional monarchy.
Ceremonial head of state: Monarch (king or queen).
Head of government: Prime minister.
Legislature: States-General of two houses: 75-member First Chamber and 150-member Second Chamber.
Executive: Prime minister and Cabinet.
Political subdivisions: 12 provinces.

People

Population: *Estimated 2002 population*—15,849,000. *1991 census*—15,010,445.
Population density: 989 per mi² (382 per km²).
Distribution: 61 percent urban, 39 percent rural.
Major ethnic/national groups: Almost entirely Dutch. Largest non-Dutch groups include people from Indonesia, Morocco, Suriname, and Turkey.
Major religions: About 30 percent Roman Catholic, about 30 percent Protestant (mostly Dutch Reformed Church), small percentage Muslim. Nearly half of the Dutch are not members of any church.

Population trend

Year	Population
1816	2,047,000
1829	2,613,000
1839	2,861,000
1849	3,057,000
1859	3,309,000
1869	3,580,000
1879	4,013,000
1889	4,511,000
1899	5,104,000
1909	5,858,000
1920	6,865,000
1930	7,936,000
1940	8,923,000
1947	9,625,000
1960	11,556,000
1971	13,060,000
1975	13,653,000
1980	14,144,000
1985	14,492,000
1990	14,952,000
1995	15,503,000

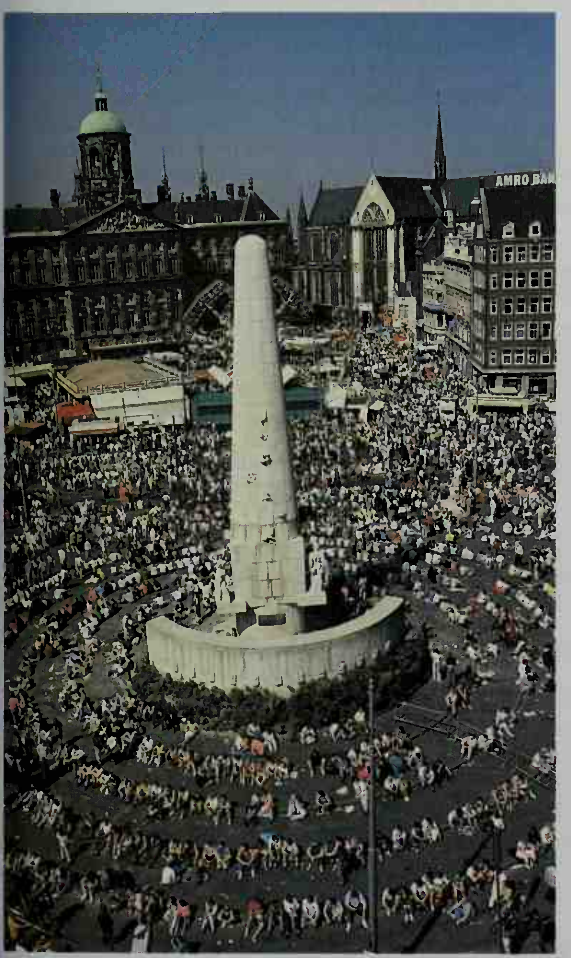
Economy

Chief products: *Agriculture*—barley, beef and dairy cattle, flowers and flower bulbs, hogs, milk, potatoes, poultry, sheep, sugar beets, vegetables, wheat. *Fishing*—eels, herring, mackerel, mussels, plaice, shrimp, sole. *Manufacturing*—chemicals, dairy products, electronic equipment, machinery, processed meats, transportation equipment. *Mining*—natural gas, petroleum, salt.
Money: *Basic unit*—euro. One hundred cents equal one euro. The guilder was taken out of circulation in 2002.
Foreign trade: *Major exported goods*—automobiles, chemicals, dairy products, electric machinery, flowers, meat, petroleum, plastics, precision instruments, vegetables. *Major imported goods*—automobiles, chemicals, clothing, electric machinery, iron and steel, paper and paper products, petroleum, plastics, and precision instruments. *Main trading partners*—Belgium, France, Germany, Italy, Luxembourg, United Kingdom, United States.

the major cities house many immigrants as well as university students and young adults.

Rural life. Because every region of the Netherlands has several cities, few rural areas are truly remote. Farms are commercial businesses, and rural life is not too different from life in the towns. Most villages are accessible by water and are well provided with services and public transportation.

People in farm areas and fishing villages sometimes wear the famous Dutch wooden shoes, called *klompen (KLAHMP uhn).* These shoes are noisy, but they protect the feet from damp earth better than leather shoes do. The Dutch do not wear wooden shoes in their homes. They leave them outside and change to leather shoes.



In a few rural areas, the people still wear the traditional Dutch costume, which includes full trousers for men and full skirts and lace caps for women. These areas include the islands of the province of Zeeland *(ZAY lahnt),* coastal fishing communities, and the towns of Staphorst *(STAHP hawrst)* and Spakenburg *(SPAH kuhn burk).*

Food and drink. The Dutch diet is similar to that of other northern European countries. Breakfasts often consist of bread, cheese, and cold meat. Most people eat a light lunch of a sandwich or salad. Most dinners include meat or fish, potatoes, and vegetables. Indonesian food is also popular. Traditional dishes include *hutspot* (a stew of meat, vegetables, and potatoes, pronounced *HUTS paht);* raw herring sprinkled with onions; and large, thin pancakes covered with toppings. Beer and *jenever* (a juniper-flavored gin, pronounced *yuh NAY fur)* are popular alcoholic drinks.

© Arthur M. Greene, Bruce Coleman, Inc.

Bicycle riders cross an intersection in Gouda, *above.* Bicycling is popular among Dutch people of all ages, both as a recreational activity and as an important means of transportation.

© Glen Allison, Tony Stone Images

A Queen's Day celebration, held annually on April 30, includes a variety of entertainment. *Above,* people gather for festivities at a World War II monument in Amsterdam's Dam Square.

Holidays and recreation. Most people in the Netherlands own a bicycle, and bicycle riding is a popular recreational activity. The Dutch also enjoy boating, sailing, and windsurfing on their many lakes, rivers, and canals. Miles of sandy beaches along the North Sea coast provide many places to swim.

Ice skating is extremely popular. But the Netherlands has mild winters, and the ice often does not get thick enough for skating. When the ice is hard enough, schools sometimes close to let the children skate. In exceptionally cold winters, an ice-skating race called the Elfstedentocht *(ehlf STEHD uhn tahkt)* takes place on the waterways of Friesland. The 124-mile (200-kilometer) course connects 11 cities of the northern province.

Every community has sport clubs that organize team sports for youths and adults. The most popular sports include field hockey, soccer, and tennis.

The people of the Netherlands are famous for raising tulips and other flowers, and they hold many spectacular flower festivals each spring. Long parades of floats covered with blue, pink, red, and yellow blossoms wind through the towns near the bulb fields. Homes along the way are also decorated with beautiful floral designs.

The Dutch celebrate Queen's Day, the birthday of former Queen Juliana, on April 30 with local parades, games, and flea markets. Most towns hold a fair called a *kermis (KEHR mihs)* with carnival attractions and other entertainment.

The Dutch exchange gifts on St. Nicholas's Eve, December 5, instead of on Christmas. The children believe that Saint Nicholas visits their homes with presents for

good boys and girls. A man dressed like a bishop represents Saint Nicholas and rides through the streets on a white horse. In Amsterdam, he arrives by steamship and is greeted by ringing bells and cheering crowds.

During the 1600's, the Dutch brought the custom of Saint Nicholas's visit with them to America. There, the English settlers changed his Dutch nickname, *Sinterklaas,* to *Santa Claus.*

Religion. Roman Catholics and Protestants each make up about 30 percent of the Dutch population. The Netherlands also has a small number of Muslims. Nearly half of the Dutch are not members of any church. The majority of Protestants belong to the Dutch Reformed Church. Members of the royal family traditionally belong to this church, but it is not an official state church.

Education. Dutch law requires children from ages 5 through 16 to go to school. All schools that meet national educational standards, including religious schools, receive government funds. The standards, set by law, include courses of study and hiring of teachers. Almost all adults can read and write. For the country's literacy rate, see **Literacy** (table: Literacy rates for selected countries).

The Netherlands has no general high school program. Instead, it has several kinds of high schools. Each kind trains students for a special purpose, such as university work, advanced study in various institutes, or jobs in business or industry.

The Open University, based in Heerlen, has the most students of any Dutch university. Instruction is carried out through correspondence. In addition, the Netherlands has 13 traditional universities and many specialized institutions for higher education. The University of Amsterdam is the largest traditional university. Leiden University, founded in 1575, is the oldest university.

Arts. The Netherlands has produced some of the world's greatest painters. During the 1600's, the country's Golden Age, the northern Netherlands was a republic. Without a royal court to order works of art, Dutch artists had to sell their creations to the country's prosperous bankers, merchants, and traders. Dutch buyers looked for small paintings suitable for private homes, rather than large-scale religious works, so Dutch artists often painted ordinary people and things. Frans Hals became a master painter of portraits. Pieter de Hooch *(PEE tuhr duh HOHK)* and Jan Vermeer *(yahn vuhr MEER)* often painted indoor scenes, and Jacob van Ruisdael *(YAH kawp vahn ROYS dahl)* specialized in landscapes. Rembrandt painted masterpieces on many subjects.

Later Dutch painters include Vincent van Gogh and Piet Mondrian. Van Gogh, who painted in the late 1800's, is one of the most famous painters in modern art. Mondrian, who developed his extremely simplified geometric style of painting in the early 1900's, influenced modern architecture and commercial design as well as painting. Many museums in the Netherlands exhibit the works of the great Dutch artists. Among them are the Rijksmuseum and Stedelijk Museum in Amsterdam and the Gemeentemuseum in The Hague.

The Dutch enjoy reading and support many writers. But Dutch literature is little known outside the Netherlands, and few works have been translated. One of the most important Dutch writers is Joost van den Vondel *(YOHST vahn dehn VAHN duhl),* a celebrated poet and playwright of the Golden Age. Constantijn Huygens

In the Rijksmuseum in Amsterdam, visitors admire Rembrandt's famous painting *The Night Watch.* The Netherlands has many museums that exhibit masterpieces of Dutch art. The country has produced some of the world's greatest painters.

(KAHN stuhn TYN HY guhnz), another figure of the Golden Age, produced witty, elegant verse.

Other important writers include Willem Bilderdijk *(VIHL uhm BIHL duhr DYK),* Multatuli *(MUL tuh TOO lee),* and Louis Couperus *(loo EE koo PAY ruhs).* Bilderdijk, a poet of the late 1700's and early 1800's, foreshadowed the Romantic era. Multatuli, the pen name of Eduard Douwes Dekker, was the author of *Max Havelaar* (1860), a novel about life in the Dutch East Indies that exposed the corruption and misrule there. Couperus, who wrote in the late 1800's and early 1900's, was acclaimed for his psychological novels.

Among the better-known Dutch composers are organist Jan Pieterszoon Sweelinck *(yahn PEE tuhr SOHN SVAY lihngk),* who achieved renown at the beginning of the 1600's for his organ compositions, and Willem Pijper *(VIHL uhm PY puhr),* a leading composer in the first half of the 1900's. Several Dutch cities have fine symphony orchestras. The Concertgebouw *(kahn SAIRT guh bow)* Orchestra of Amsterdam is world famous.

The land

The Netherlands has four main land regions: (1) the Dunes, (2) the Polders, (3) the Sand Plains, and (4) the Southern Uplands.

The Dunes are high, sandy ridges where tall grasses often grow. This region curves in a line along the entire North Sea coast of the Netherlands. In the north, the line consists of the West Frisian Islands. The line is unbroken in the center, but it is broken in the south by wide river outlets.

The Polders lie mostly below sea level and are protected from the sea by the sand dunes or by dikes. The Prins Alexander Polder, the lowest point in the Netherlands, is near Rotterdam. It lies 22 feet (6.7 meters) below sea level. The Polders region forms over two-fifths of the country. It consists of flat, fertile areas of clay soils that were once covered by seas, swamps, or lakes. It has some of the country's most productive farmlands and largest cities.

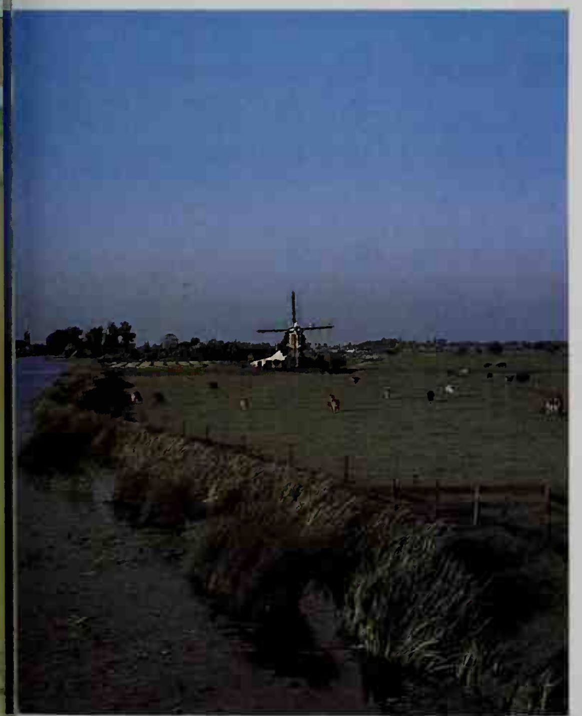
Much of the southern part of the Polders consists of marshy islands and peninsulas that make up a delta. The delta is formed by the Maas *(mahs)* and Schelde *(SKEHL duh)* rivers and branches of the Rhine River. Massive dams prevent the sea from flooding the region. One of the dams has huge floodgates that allow salt water and natural tides to enter the protected area. This preserves the natural environment and the fishing economy of the region. During storms, the floodgates can be closed.

The Sand Plains lie less than 100 feet (30 meters) above sea level in most places. In the southwest, the re-

WORLD BOOK map

The Dutch have "created" land for centuries by pumping out the water that covered it. The drained areas are called *polders.* The map above shows the development of polders since 1300.

gion rises higher. Low, sandy ridges cross the plains and create a rolling landscape. Orchards are in the east. Forests cover much of the region. A broad valley of clay soils lies along the banks of the Maas, called the Meuse in French, and along the branches of the Rhine. These rivers and the canals that connect them with other rivers form an important transportation network.



The Southern Uplands form the highest land region. The highest point, Vaalser Berg *(VAHL suhr BEHRK)*, rises 1,053 feet (321 meters) near Maastricht *(MAHS trihkt)*. The region has naturally fertile soils.

Climate

The Netherlands has a mild, damp climate. It has gentle winters and moderately warm summers. The sky is frequently overcast in winter, and fog often covers the land. Temperatures average from 60 to 65 °F (16 to 18 °C) in summer, and a little above 30 °F (−1 °C) in winter. Extremely hot or cold temperatures are rare.

The Netherlands is small in area, and there are no great differences of climate from region to region. Most areas of the country receive about 25 to 30 inches (63 to 76 centimeters) of *precipitation* (rain, melted snow, and other forms of moisture) in a year. Summer is the wettest season, but precipitation is fairly evenly distributed throughout the year. The Dutch weather is changeable, and showers may fall unexpectedly.

Floods threaten the Netherlands from two directions. North Sea storms pound against the coastal dunes and sea dikes. Rain-swollen rivers, especially the Maas and the Rhine, press against the river dikes. Dike breaks in

© Henk van der Leeden, The Picture Box

A polder is an area that was once covered by water. The Dutch built dikes around these areas and drained the water. This fertile land is an example of the many polders in the Netherlands.

the past have resulted in many floods, sometimes with great loss of life. For example, a massive flood along the North Sea coast in 1953 caused about 1,800 deaths. The country is so low-lying that it would be flooded if global warming melted polar ice and raised the sea level.

Economy

The economy of the Netherlands is technically advanced and highly industrialized. Because the country has few natural resources, it depends heavily on foreign trade. Industries import most raw materials and export finished products. Modern farming techniques have made the small amount of farmland highly productive.

Service industries, taken together, account for over two-thirds of the gross domestic product (GDP)—the total value of goods and services produced within the

Gross domestic product of the Netherlands

The gross domestic product (GDP) of the Netherlands was $360,478,000,000 in 1997. The GDP is the total value of goods and services produced within a country in a year. *Services* include community, social, and personal services; finance, insurance, real estate, and business services; government; trade, restaurants, hotels, and repair shops; transportation and communication; and utilities. *Industry* includes construction, manufacturing, and mining. *Agriculture* includes agriculture, fishing, and forestry.

Production and workers by economic activities

Economic activities	Percent of GDP produced	Employed workers: Number of persons	Employed workers: Percent of total
Finance, insurance, real estate, & business services	25	1,014,000	14
Manufacturing	17	1,103,000	16
Trade, restaurants, hotels, & repair shops	15	1,462,000	21
Government	12	*	*
Community, social, & personal services	11	2,245,000	32
Transportation & communication	7	423,000	6
Construction	5	448,000	6
Agriculture, forestry, & fishing	3	259,000	4
Mining	3	13,000	†
Utilities	2	42,000	1
Total	100	7,009,000	100

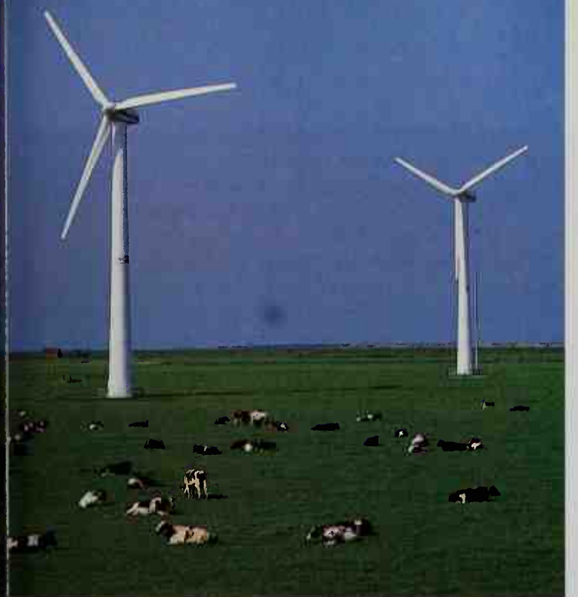
*Included in Community, social, and personal services.
†Less than one-half of 1 percent.
Figures are for 1997.
Sources: United Nations; International Labor Office.

country in a year. Over 70 percent of all workers are employed by service industries. Finance, insurance, real estate, and business services make up the leading service industry. These services provide about a fourth of the country's GDP—more than any other industry. Trade, restaurants, hotels, and repair shops form the second most important service industry.

Manufacturing accounts for about a sixth of the GDP. Several large international manufacturers have headquarters in the Netherlands. For example, Eindhoven *(EYENT HOH vuhn)* is the headquarters of Philips Electronics, one of the world's largest electronics firms. The company produces household appliances, consumer electronics, and semiconductors. Other manufacturers produce automobiles and trucks, small commercial airplanes, and industrial machinery.

Food processing is a major manufacturing industry. Dairy products are the chief food products. The Netherlands is one of the world's major cheese manufacturers. Other Dutch food products include beer, chocolate, processed meats, and sugar.

The chemical industry produces drugs, paints, plastics, and synthetic rubber. Rotterdam is the site of a huge complex of oil refineries and chemical plants. Amsterdam has long been a famous center of diamond cutting and polishing. Delft is known for producing earthenware pottery called Delftware.



Agriculture. Because land is scarce, Dutch farmers work to make their soil as productive as possible. The farms average only 36 acres (15 hectares). But by fertilizing the soil heavily and using modern equipment, Dutch farmers have become specialized producers of products sold throughout the world. The value of agricultural exports is larger than the value of agricultural imports.

About two-thirds of the country's total land area is farmland. Just over half of the farmland is used for grazing, and the rest is used to grow crops. Dairy farming is the most important branch of agriculture. Most dairy

Economy of the Netherlands

This map shows the economic uses of land in the Netherlands. It also indicates the country's main farm products, its chief mineral deposits, and its most important fishing products. Major manufacturing centers are shown in red.

© Jose Fusta Raga

Dairy cows are a familiar sight in the Netherlands. Dairy farming is the country's most important branch of agriculture. Modern windmills stand in the grazing land pictured above.

© Zefa from The Stock Market

Tulip fields add splashes of color to the flat land of the Netherlands. Flowers and flower bulbs are important products of Dutch agriculture. Fresh flowers are flown to places all over the world.

farmers also raise crops, mainly to feed their livestock. The grazing land supports about $4\frac{1}{2}$ million cattle, chiefly dairy cows. Dutch farmers also raise beef cattle, hogs, poultry, and sheep.

The country's principal crops include barley, potatoes, sugar beets, and wheat. An important specialty of Dutch agriculture is horticulture. Flowers and vegetables are grown in enormous greenhouses. They are trucked to neighboring countries, and fresh flowers are flown to most parts of the world. Flower bulbs, especially tulip bulbs, are also important.

Mining. The Netherlands has large deposits of natural gas and salt, and some petroleum. One of the world's largest natural gas fields lies near Slochteren *(SLAHK tuh ruhn),* in the northeastern province of Groningen *(GROH nihng uhn).* Oil wells operate offshore in the North Sea.

Fishing. The fish catch comes mainly from coastal waters and inlets, and from the North Sea. Coastal waters provide eels, mussels, and shrimp. The major sea catches are herring, mackerel, plaice, and sole.

Energy sources. The Netherlands is a major producer of natural gas. But its oil wells supply only a small part of its petroleum needs. Natural gas provides most of the country's energy, and petroleum, coal, and nuclear power provide the rest.

International trade. The Netherlands relies heavily on foreign trade because it has few natural resources. Its chief trading partner is Germany. Other important trading partners are Belgium, France, Italy, Luxembourg, the United Kingdom, and the United States.

The main imports of the Netherlands include automobiles, chemicals, clothing, electric machinery, iron and steel, paper and paper products, petroleum, plastics, and precision instruments. Among the exports are automobiles, chemicals, dairy products, electric machinery, flowers, meat, petroleum, plastics, precision instruments, and vegetables.

Transportation. The Netherlands has an extensive network of navigable rivers and canals. The main rivers and many of the canals are important waterways. Barges

© B&U International Picture Service

An oil refinery in Rotterdam processes petroleum. Rotterdam has a large complex of oil refineries. Oil wells operate off the shores of the Netherlands in the North Sea.

on these waterways carry a great deal of the country's freight. The country's railroad system provides fast and frequent service.

The Netherlands has an excellent network of paved roads. Almost all Dutch families own an automobile, and most people have a bicycle. The bicycle remains important for transportation as well as recreation. Bike paths are found throughout the country. Motor-driven bicycles called *bromfietsen* (pronounced *BRAHM feet suhn),* which literally means *roar bikes,* are common.

Rotterdam is the busiest seaport in the world. It serves as a gateway to and from much of Europe by way of the Rhine River, one of Europe's busiest inland waterways. Amsterdam, the second largest port in the Netherlands, is linked to the North Sea by the North Sea Canal, one of the world's deepest and widest artificial waterways. The

canal is about 50 feet (15 meters) deep and 525 feet (160 meters) wide.

The country's most important airport, Schiphol *(SKIHP hohl)*, near Amsterdam, is one of the busiest airports in Europe. Royal Dutch Airlines (KLM) has headquarters there. Established in 1919, KLM is the oldest airline in the world still in operation.

Communication. The Netherlands has about 45 daily newspapers. The largest is *De Telegraaf,* published in Amsterdam and sold throughout the country.

Traditionally, private broadcasting companies have prepared most programs for the radio and television networks. Most of these companies represent political, religious, or cultural groups. In the late 1900's, commercial broadcasting emerged to supplement the traditional private programming. In addition, cable television opened the country to a wide variety of foreign and commercial programs. Postal and telephone services are provided by a private firm.

History

Early days. In the 50's B.C., Roman soldiers under Julius Caesar invaded what are now the Netherlands, Belgium, and Luxembourg. The Romans conquered much of the region, now called the Low Countries. The word *Netherlands* means *Low Countries,* but the Low Countries also include Belgium and Luxembourg.

In the A.D. 400's, a Germanic people called the Franks drove the Romans out of the Low Countries. The Frankish kingdom broke apart during the 800's. In 870, the Low Countries were divided between the East and West Frankish kingdoms (later Germany and France). The area that is now the Netherlands became part of the East Frankish kingdom.

The rise of commerce. Local dukes, counts, and bishops became increasingly powerful as the region developed. During the 1100's, trade and industry began to expand rapidly in the Low Countries. Fishing, shipbuilding, shipping, and textile manufacturing became especially important. Towns began to develop and grow.

Spanish control. Beginning in the 1300's, the French dukes of Burgundy won control of most of the Low Countries through inheritance, marriage, purchase, and war. The marriage of Mary of Burgundy to Maximilian of the House of Habsburg in 1477 joined the Low Countries with the Habsburg empire. In 1516, Mary and Maximilian's grandson Charles inherited the kingdom of Spain, putting the Low Countries under Spanish control. In 1519, Charles also became Archduke of Austria and Holy Roman Emperor Charles V.

Freedom from Spain. During the early 1500's, a Protestant movement called the Reformation spread through the Low Countries. Charles tried to stop this threat to Roman Catholicism by persecuting Protestants. Charles gave up rule of the Low Countries and of Spain, in 1555 and 1556, to his son, Philip II. Philip stepped up the struggle against Protestants and tried to take complete power over the Low Countries. In 1566, the people began to rebel. In 1568, William I (called the Silent), prince of Orange, led the nobles in revolt.

The Spanish troops were generally successful in land battles, but the rebels' ships controlled the sea. The Spaniards attacked Leiden in 1573, but the city held out bravely. In 1574, the people opened dikes that held back the sea, and a Dutch fleet sailed over the floodwaters to rescue Leiden from the Spaniards.

By 1579, the revolt had started to break apart. The southern provinces of the Low Countries (now Belgium) returned to Spanish control. Protestantism became stronger in the northern provinces (now the Netherlands). In 1579, most northern provinces formed the Union of Utrecht and pledged to continue the revolt.

On July 26, 1581, the northern provinces declared their independence from Spain, beginning what later became known as the Dutch Republic or the Netherlands. The Dutch fought for their freedom until 1648, except for a temporary peace from 1609 to 1621. Spain finally recognized Dutch independence in 1648.

Prosperity and power. The 1600's were the Golden Age of the Netherlands. The country became the leading sea power. Its merchant fleet tripled in size between 1600 and 1650, and the Dutch accounted for about half of Europe's shipping. Dutch explorers, including Willem Barents *(VIHL uhm BAHR uhnts)* and Abel Janszoon Tasman *(AH buhl YAHN sohn TAZ muhn),* found new sea routes and fisheries. Amsterdam became a great trading center of Europe. Dutch banks and businesses thrived. The Golden Age also brought major cultural achievements, especially in painting.

During the Golden Age, the Dutch Republic developed a great colonial empire in many parts of the world. In 1602, Dutch firms trading with the East Indies combined to form the Dutch East India Company. The company founded Batavia (now Jakarta, the capital of Indonesia) as its headquarters. The company's forces

Important dates in the Netherlands

50's B.C. Julius Caesar conquered much of the Low Countries, including what is now the Netherlands.

A.D. 400's-800's The Franks controlled the region.

870 The Netherlands became part of the East Frankish kingdom (now Germany).

1300's-1400's The French dukes of Burgundy united most of the Low Countries.

1516 Charles, ruler of the Low Countries, became King Charles I of Spain. In 1519, Charles became Holy Roman Emperor Charles V.

1581 The Dutch declared their independence from Spain.

1648 Spain recognized Dutch independence.

1600's The Netherlands became the world's major sea power and developed a great colonial empire.

1795-1813 France controlled the Netherlands.

1815 The Netherlands became an independent kingdom united with Belgium.

1830 Belgium revolted and became independent.

1940-1945 Germany occupied the Netherlands in World War II.

1949 The Netherlands granted independence to the Netherlands Indies (now Indonesia).

1954 The colonies of Suriname and Netherlands Antilles became equal partners in the Dutch kingdom.

1957 The Netherlands helped form the European Economic Community, a forerunner of the European Union (EU).

1962 The Netherlands gave up control of West New Guinea (now Irian Jaya) to the United Nations.

1975 Suriname became a fully independent nation.

1992 The Netherlands and 11 other European nations signed the Treaty of European Union, an agreement establishing the EU, in the Dutch city of Maastricht.

Granger Collection

The Golden Age of the Netherlands was the 1600's. During this period, the country became a leading sea power, and it developed an extensive colonial empire. Ships bringing goods to and from Amsterdam, *above,* made the city one of the greatest trading centers of Europe.

largely drove the British and Portuguese out of what later became the Netherlands Indies (now Indonesia). The company also took control of Ceylon (now Sri Lanka) and colonized the southern tip of Africa. From the mid-1600's to the mid-1800's, the Dutch were the only Westerners allowed to trade with Japan.

The Dutch West India Company was founded in 1621 to trade in the New World and western Africa. In 1624, the company colonized New Netherland, which consisted of parts of present-day New York, New Jersey, Connecticut, and Delaware. In 1626, the colony's governor, Peter Minuit, bought Manhattan Island from the Indians for goods worth about $24. Dutch colonists had established New Amsterdam (now New York City) there the year before. From 1630 to 1654, the Dutch controlled Brazil. During that time, the Dutch also acquired what are now the Netherlands Antilles and Aruba.

Wars with England and France. The Netherlands fought three naval wars with England from 1652 to 1674. The English hoped to seize the shipping and trading leadership from the Dutch, but they failed. During this period, the Dutch won what is now Suriname from the English, and the English gained New Netherland.

France and England formed a secret alliance against the Dutch Republic in 1670 and attacked it in 1672. The Dutch fleet prevented the English from landing by sea, but French troops seized a number of Dutch towns. William III, prince of Orange, was then elected *stadholder* (governor). He stopped the French by opening some dikes and flooding the land. Spanish and German troops also helped the Dutch. The English suffered major defeats at sea, and they made peace with the Dutch in 1674. The French were driven out, and they signed a peace treaty in 1678.

William's wife, Mary, was a member of the English royal family. In 1689, William led what is called the Glorious Revolution and became King William III of England as well as the Dutch stadholder. The Netherlands, England, and other European countries battled France in two more wars, fought from 1689 to 1697 and from 1701 to 1714.

The 1700's. The long wars against France exhausted the Netherlands. Dutch industry and trade began to falter, and the Netherlands entered a period of economic decline.

During the Revolutionary War in America (1775-1783), the Dutch aided the Americans against the British. Britain started a naval war against the Dutch in 1780. The Dutch were severely defeated by 1784.

In 1795, the weakened Netherlands fell to invading French troops. The Dutch supporters of the French renamed the country the Batavian Republic and set up a new government. Britain seized most of the Dutch overseas possessions.

Independence. In 1806, Napoleon I of France forced the Dutch to accept his brother Louis as their king. The Batavian Republic became the Kingdom of Holland. Napoleon wanted tighter control over the country and made it part of France in 1810. The Dutch drove out the French in 1813.

In 1814 and 1815, Europe's political leaders remapped much of the continent at a series of meetings called the Congress of Vienna. They united Belgium, Holland, and Luxembourg into the Kingdom of the Netherlands to limit the power of France. William VI, prince of Orange, became King William I of the Netherlands and Grand Duke of Luxembourg.

The customs, economies, languages, and religions of the Dutch and the Belgians differed greatly. The majority of Belgians were Roman Catholics, and the upper classes spoke French. In 1830, Belgium declared its independence from the Kingdom of the Netherlands.

Luxembourg ended its political ties with the Dutch royal family in 1890. That year, 10-year-old Wilhelmina had become queen after the death of her father, William III. But Luxembourg's laws did not permit a female ruler.

The Netherlands stayed neutral during World War I (1914-1918). But the naval operations of the warring countries interfered with Dutch shipping and trading.

World War II. On May 10, 1940, during World War II, German troops invaded the Netherlands. Four days later, German bombers destroyed much of Rotterdam. The

AP/Wide World

After World War II, much of the Netherlands lay in ruins. For example, central Rotterdam, *shown here,* was destroyed, and its great port was crippled. The Dutch quickly rebuilt their country.

Dutch army surrendered. Most of the Dutch navy escaped capture and supported the Allies, the countries opposing Germany and its partners.

During the German occupation, from 1940 to 1945, the Dutch suffered greatly. The Germans killed about 75 percent of the nation's Jews—about 104,000 people—mostly in death camps. They also forced thousands of other Netherlanders to work in German factories. The Dutch resistance movement secretly published newspapers, hid Jews from capture, and committed acts of sabotage against the Germans. By the time Germany surrendered to the Allies in May 1945, about 250,000 Netherlanders had been killed or had starved to death.

The Netherlands was also involved in the war in the Pacific Ocean. In March 1942, the Netherlands Indies (now Indonesia) fell to Germany's ally Japan after the defeat of the Dutch fleet. The tens of thousands of Dutch then residing in the Indies became prisoners in Japanese camps.

Economic recovery. World War II left much of the Netherlands in ruins. Many of the nation's factories, bridges, and railroad lines had been destroyed. The great harbor at Rotterdam was crippled. Much of the land was flooded as a result of damage to the dikes.

After the war, the Dutch dedicated themselves to rebuilding their country, and the government supported close international cooperation to achieve this goal. In 1945, the Netherlands became a charter member of the United Nations (UN). In 1948, the Netherlands joined with Belgium and Luxembourg to eliminate all tariffs on trade among themselves, forming an organization called Benelux. In 1949, the Netherlands became part of the North Atlantic Treaty Organization (NATO), a defense alliance of European and North American nations.

In the 1950's, the Netherlands helped form the European Coal and Steel Community, the European Atomic Energy Community (Euratom), and the European Economic Community. These agencies later became the basis for the European Union, which works for economic and political cooperation among its members.

By 1955, Dutch industrial production had increased about 60 percent over the pre-World War II level. Farm output was almost 20 percent greater.

Political changes. In 1948, the aging Queen Wilhelmina gave up the throne to her daughter, Juliana. At that time, a revolt was underway in the Netherlands Indies. The fighting, which had started in 1945, continued until 1949, when the Netherlands recognized Indonesia's independence. In 1954, Suriname and the Netherlands Antilles—which then included the island of Aruba—were made self-governing and equal members of the Dutch kingdom. In 1962, the Dutch gave up West New Guinea (now Irian Jaya), their last colony, to UN control. The UN turned over Irian Jaya to Indonesia in 1963.

In 1980, Juliana gave up the throne at the age of 71. Her oldest daughter, Beatrix, became queen.

Economic development. By the late 1900's, the Netherlands had achieved a high standard of living. Economic cooperation, both with other countries and at home, helped the Dutch to reestablish much of their prosperity after World War II. During the late 1940's and the 1950's, Dutch industry, labor, and government worked together to avoid strikes and expand industry. The discovery of a natural gas field in the northern part of the country in 1959 also provided the Netherlands with a great economic boost. And Rotterdam, heavily damaged during the war, was rebuilt.

Diversity. Hundreds of thousands of people from former Dutch colonies and from Mediterranean countries have moved to the Netherlands. This immigration has added diversity to the country's population. Many of the immigrants came from Indonesia. In the 1970's, people from the Molucca Islands demanded that the Dutch government take steps to free their homeland from Indonesian control. Some Moluccans in the Netherlands staged terrorist acts to dramatize their demands.

In 1975, Suriname left the Kingdom of the Netherlands and became a fully independent nation. Many people from Suriname moved to the Netherlands shortly before independence. In the late 1900's, many Turks and Moroccans settled in the Netherlands. Refugees from many countries also came to the Netherlands because of its liberal laws granting political *asylum* (shelter and protection) to people fleeing other nations.

Recent developments. In 1992, the Netherlands was 1 of 12 countries that signed the Treaty on European Union, also called the Maastricht Treaty for the Dutch city where it was signed. This treaty provided for the formation of the European Union. The treaty also called for a single European currency, known as the *euro.* In 1999, the Netherlands and most other European Union countries officially adopted the euro. Euro notes and coins replaced the notes and coins of the traditional Dutch currency, the guilder, in 2002. Jan de Vries

Netherlands Antilles, *an TIHL eez,* also called the Dutch West Indies, consists of two groups of islands in the Caribbean Sea. One group lies about 50 miles (80 kilometers) from Venezuela. The smaller group is about 500 miles (800 kilometers) northeast of the main islands and about 160 miles (257 kilometers) east of Puerto Rico.

The islands have a total area of 308 square miles (798 square kilometers) and a population of about 221,000. The southern group, made up of Bonaire and Curaçao, covers 266 square miles (689 square kilometers) and has about nine-tenths of the population. Curaçao, which covers 171 square miles (444 square kilometers), is the largest island in either group. Willemstad, capital of the Netherlands Antilles, is on Curaçao. The northern group includes Saba and St. Eustatius islands, and the southern part of St. Martin (also spelled St. Maarten) Island. These islands cover only 26 square miles (68 square kilometers). See **Curaçao; Willemstad.**

Oil refining and tourism are the major industries in the Netherlands Antilles. Crude oil is shipped to refineries on Curaçao from Venezuela. Tourism is the chief industry of the other islands. The land and climate of the islands make farming difficult. Most of the food must be imported. The people on Curaçao speak Dutch, English, Spanish, and a mixture of the three languages called *Papiamento.*

The Netherlands Antilles is an equal partner with the Netherlands in the Kingdom of the Netherlands. The islands are self-governing. The governor is appointed by the Dutch monarch.

The Spanish first occupied Curaçao in 1527. The Dutch captured the Antilles area between 1630 and 1654, the period that they controlled Brazil. The island of Aruba was formerly part of the Netherlands Antilles. It split from them in 1986 (see **Aruba**). Gerald R. Showalter

Nettle is the common name of a group of plants with stinging bristles. Nettles are coarse herbs that grow as weeds in North America, Europe, and Asia. They have leaves that grow opposite one another on the stem, and tiny flower clusters. Nettle bristles contain a watery juice that produces an intense itch when it enters a person's skin. This itch does not last long. The bristles usually have no effect in places where the skin is thick.

Young shoots of nettle plants can be cooked like spinach and are a good source of vitamins and protein. People have used nettles for medicinal purposes since ancient times. The *stinging nettle* of Europe and the United States has been cultivated for its fiber, from which a strong, coarse cloth can be made.

Ronald L. Jones

Scientific classification. Nettles belong to the nettle family, Urticaceae. They make up the genus *Urtica.* The stinging nettle is *U. dioica.*

Stinging nettle

Netzahualcóyotl, *NAY tsah wahl KOH YOHT uhl* (pop. 1,224,924), is the third largest city in Mexico. Only Mexico City and Guadalajara have more people. Netzahualcóyotl is located in the state of México and borders Mexico City on the east. For location, see **Mexico** (political map).

Netzahualcóyotl was founded in 1900 as a suburb of Mexico City. It was not incorporated as a city until 1963. Since 1970, Netzahualcóyotl's population has more than doubled. The city's rapid growth has produced problems, including a shortage of good housing, a lack of basic city services, and pollution. The city is largely populated by working-class people. A number of manufacturing plants operate there. Roderic A. Camp

Neumann, Saint John Nepomucene (1811-1860), was the first male United States citizen to be recognized as a saint by the Roman Catholic Church. He was *canonized* (declared a saint) in 1977.

Neumann was the bishop of Philadelphia from 1852 until his death. As bishop, he increased the number of Catholic elementary schools in the city from 2 to almost 100. He helped bring several sisterhoods from Europe to run the schools.

Neumann was born on March 28, 1811, in Prachatitz, Bohemia. He came to the United States in 1836 and was ordained later that same year. In 1840, he joined the Redemptorist Fathers, a society of missionary priests. Neumann became a U.S. citizen in 1848. Robert P. Imbelli

Neuralgia, *nu RAL juh,* is a severe pain that occurs along a nerve. Its cause is not known. The pain may be limited to one part of the nerve, or it may extend along the nerve's branches. It may occur as repeated stabs of pain in the teeth, sinuses, eyes, face, tongue, or throat.

Neuralgia occurs most frequently in two cranial nerves. One nerve, the *trigeminal,* has three branches that enter the eyes, face, sinuses, and teeth. The other, the *glossopharyngeal,* leads to the back of the tongue and throat. Neuralgia is sometimes confused with other conditions called *neuritis* and *radiculopathy.* But these occur in many different parts of the body. True neuritis is an inflammation that can permanently damage a nerve. Neuralgia does not harm the nerve.

Tic douloureux is a type of neuralgia that is common among older people. The name is French for *painful twitching.* Tic douloureux affects the trigeminal nerve and causes facial pain. The face muscles may contract each time a stab of pain occurs. The pain occurs very suddenly and then shoots along one side of the face. It usually begins at a specific part of the nerve called the *trigger zone.* It may then spread along branches of the nerve, but it never involves other nerves. The pain may last a few hours or several weeks. It may then disappear for a few months or years, but it usually returns.

Glossopharyngeal neuralgia is a very rare condition. It affects the throat and the back of the tongue.

Temporary relief for both types of neuralgia may be obtained by using drugs, or by numbing the nerve with an injection of alcohol. If the pain does not disappear, the only cure is a surgical operation to remove part of the nerve. Daniel S. Barth

See also **Neuritis**.

Neuritis, *nu RY tihs,* is an inflammation of a nerve that is caused by disease or injury. It is a painful condition that may affect one or many nerves. Neuritis is sometimes confused with a disorder called neuralgia (see **Neuralgia**).

Bacteria, viruses, and diet and vitamin deficiencies can cause neuritis. Infections, such as tuberculosis, syphilis, and *herpes zoster* (shingles), can invade a nerve, resulting in neuritis. Neuritis can also develop when a disease, such as diabetes, changes the activities of the body's cells. Neuritis caused by physical injury to a nerve involves only the injured nerve.

If neuritis continues for a long time, a nerve may become so badly damaged that it can no longer function properly. As a result, a person may lose the ability to sense heat, pressure, and touch. The body also may lose control over such automatic activities as sweating. If a nerve no longer can stimulate a muscle, the muscle wastes away and eventually becomes paralyzed. Neuritis requires a doctor's care. Daniel S. Barth

Neurofibromatosis, often abbreviated as *NF,* is an incurable hereditary disorder that affects the nervous system and the skin. NF is sometimes called *elephant man's disease* after the Englishman Joseph Merrick, whose disfigurement was mistakenly thought to have been caused by NF. In the 1980's, experts concluded that Merrick actually had a rarer disease called *Proteus syndrome.* NF may range in severity from a mild disorder to a severely disfiguring one. There are two forms of the disorder, called *NF-1* and *NF-2.*

NF-1, also called *Von Recklinghausen's disease,* is more common and less severe. It occurs in about 1 out of every 4,000 births. The major signs are flat, light brown spots on the skin called *café-au-lait spots,* and *benign* (noncancerous) tumors of the nerves. The tumors, called *neurofibromas,* often develop just beneath the surface of the skin, producing small to large skin growths. Tumors may affect many other parts of the body, including the bones. Many people with NF-1 have *scoliosis* (curvature of the spine). In some cases, tumors affect vital organs, and NF-1 may be life-threatening. Café-au-lait spots are usually present at birth. Neurofibromas usually appear at puberty.

NF-2, also called *bilateral acoustic neurofibromatosis,* is much rarer than NF-1, occurring in about 1 out of every 50,000 births. NF-2 is characterized by tumors in the brain, on the spinal cord, and on the nerves that control hearing. The tumors may lead to deafness, chronic headache, vision problems, partial paralysis, and, eventually, death. The first signs of NF-2 usually appear in the teens or early twenties.

The child of a person with NF has a 50 percent chance of inheriting the disorder. However, about half of all NF victims have no family history of the disorder. There is no treatment other than surgical removal of the tumors. However, hopes for finding a treatment were raised in 1990, when researchers identified the gene responsible for NF-1. This gene produces a protein, called *neurofibromin,* that researchers believe causes the disorder. Allan E. Rubenstein

Neurology, *nu RAHL uh jee,* is the field of medicine concerned with the diagnosis and treatment of diseases of the nervous system and muscles. The nervous system consists of the brain, spinal cord, and nerves (see **Nervous system**). *Neurologists* are physicians who receive special training in neurology after completing medical school. Neurologists evaluate and treat patients who

have experienced such symptoms as headaches, seizures, or paralysis, or who have such disorders as Alzheimer's disease, Huntington's disease, meningitis, multiple sclerosis, and Parkinson disease.

A neurologist begins an examination by asking the patient to fully describe the problem. The neurologist then evaluates the patient's mental functioning, emotional state, vision, hearing, speech, strength and reflexes, coordination, and perception of touch, pain, and temperature. Specialized imaging techniques may be used to view affected tissues and organs. These techniques include angiography, computed tomography, and magnetic resonance imaging (MRI). See **Angiography; Magnetic resonance imaging.** The neurologist interprets all this information to make a diagnosis and to determine treatment, which may include medications, physical therapy, or surgery. William J. Weiner

Neuron. See **Nervous system.**

Neuropathology, *NUR oh puh THAHL uh jee,* is the science that studies alterations produced by diseases of the central nervous system, nerves, or muscles. It is also concerned with changes that result from normal activity in the nervous system. These may be changes in appearance that can be seen with the unaided eye or with an optical or electron microscope. See also **Nervous system; Pathology.** Marianne Schuelein

Neurosis, *nu ROH sihs,* is a general term for a relatively mild type of mental illness. Symptoms of neurosis—which include anxiety, depression, and unreasonable fears—are usually distressing but not totally disabling. Psychiatrists once used the term as a formal category of mental disorders. Conditions formerly categorized as neuroses are now known by more specific terms. The revolutionary psychological theories of Austrian physician Sigmund Freud included the concept of neurosis as a disorder caused by conflict between conscious and unconscious impulses. Nancy C. Andreasen

See also **Freud, Sigmund; Mental illness.**

Neutra, *NOY trah,* **Richard Joseph** (1892-1970), was an Austrian-born architect who worked in California. His best designs demonstrate his goal of creating buildings that meet biological and psychological needs, as well as artistic and technical considerations. In his book *Survival Through Design* (1954), Neutra stated that people can survive only by controlling their environment through design, architecture, and city planning.

© G. Brich, Shooting Star

Neutra's Lovell House in Los Angeles was one of the first homes in America with a light steel frame and an open plan.

Neutra was born in Vienna. He moved to the United States in 1923 and settled in Los Angeles in 1925. His most famous work is the Lovell "Health" House (1927-1929) in Los Angeles, an early example of modern European architecture in the United States. A number of Neutra's later buildings, including the Tremaine House (1948) in Santa Barbara, California, suggest a continuous flow of space by the use of vast sheets of glass and thin supports. Dennis Domer

Neutrality is the official status of a government that does not take part in a war. The nations that do not take part, either directly or indirectly, are called *neutrals.* The warring countries are called *belligerents.* Belligerents want to prevent their enemies from trading with neutrals. Neutrals want to stay out of the war, and expect belligerents to respect neutral territory, freedom of the seas, and the right to trade. *Neutralization* describes the position of a nation that has been recognized as permanently neutral, such as Switzerland.

Since the late 1700's, the rights and duties of neutrals and belligerents have become part of international law. But warring nations have frequently ignored these rights and duties, and in most cases it has been difficult or impossible to enforce them. The rules of neutrality have been developed through both custom and treaty. In 1907, a group of nations at the second Hague Peace Conference set down in two treaties the traditional rules of neutrality on land and sea. These rules were an attempt to balance the differing, and often conflicting, interests of neutrals and belligerents. Individual governments also pass their own laws on neutrality.

Rights and duties. Traditionally, a neutral must not provide military assistance to either of the belligerents. In return, belligerents must respect the rights of neutrals. They must not fight on neutral territory, or move troops across neutral countries. If belligerent troops enter neutral territory, the neutral has the right to disarm them and *intern* (hold) them until the war is over.

A neutral must not build or arm warships for a belligerent. During the U.S. Civil War, Britain failed to prevent the building and departure of the *Alabama* and other British warships for the Confederacy. These ships sank many Union ships. After the war, an international court ruled that Britain had violated its neutrality.

Belligerent warships may enter a neutral port in an emergency. But if they stay more than 24 hours, they can be interned. Belligerents may not use neutral ports for naval operations.

Neutrals have the right to trade with other neutrals. But belligerents may search neutral ships. If these ships are carrying war materials to the enemy, the belligerent has the right to seize the goods. Belligerents often decide for themselves what to consider as war materials. They may blockade enemy ports and seize neutral vessels that try to *run* (slip through) the blockade.

World War I. In 1914, Germany violated the rules of neutrality by invading Belgium, whose permanent neutrality had been guaranteed by treaty in 1831.

The United States remained neutral in World War I from 1914 to 1917. During this time, the United States tried to defend its neutral rights at sea against violation by Britain, France, and Germany. Britain and France

seized cargoes bound for neutral countries such as Denmark and Norway. They argued that such cargoes might eventually reach Germany. The United States insisted that Britain and France could not interfere with neutral rights or blockade neutral ports.

In 1917, the United States declared war against Germany, partly because Germany had violated U.S. neutrality. German submarines had sunk U.S. ships without warning. Under international law, Germany could capture ships carrying war materials to the enemy. But German submarines were unable to take captured ships into port, so they sank them. The loss of lives and property helped turn U.S. public opinion against Germany.

Between wars. Conflicts over neutral rights had twice been major causes for the United States to go to war, in 1917 and in 1812 (see **War of 1812** [Causes of the war]). In the 1930's, Congress passed several acts designed to keep the United States out of another war. These acts placed limits on U.S. neutral rights beyond those required by international law. They forbade the export of war materials and the extension of loans or credits to belligerents. They also provided that other goods could be exported only on a *cash-and-carry* basis. This meant that the belligerent had to pay cash and use its own ships to carry the goods. If the ships were sunk, the United States would not suffer any losses.

World War II. Early in World War II, Germany violated the neutrality of Belgium, Denmark, the Netherlands, Norway, and Yugoslavia. The United States soon shifted from a policy of impartial neutrality to one of aid to the Western allies. The laws of the mid-1930's were modified in November 1939 to permit the export of all materials to belligerents on a cash-and-carry basis.

When German victories threatened Britain, the United States violated its neutral obligations by sending 50 destroyers and other war materials to the British. In March 1941, Congress passed the Lend-Lease Act to aid countries fighting Nazi Germany. After Japan attacked Pearl Harbor in December 1941, the United States declared war on Japan. Germany, a Japanese ally, then declared war on the United States.

After World War II, many countries, especially in Asia and Africa, refused to support either the Communist or non-Communist blocs in the Cold War (see **Cold War**). These countries sought security through policies of nonalignment and noninvolvement. They were called *neutralist, nonaligned,* or *uncommitted* nations. However, the idea of opposing blocs lost meaning in 1991, when the Soviet Union—the leading Communist country during the Cold War—was dissolved.

Neutrality today. Total warfare and the growth of world and regional organizations like the United Nations (UN) have made neutrality more difficult to define. Total warfare has erased many distinctions between civilian and military activities and materials. This undercuts many of the arguments neutrals previously used to support their rights of neutral trade. Collective action, such as use of a UN police force against an aggressor, is in many ways in disagreement with earlier practices of neutrality. Robert J. Pranger

Neutralization, *NOO truh luh ZAY shuhn,* is a chemical reaction in which an acid and a base form a salt. If the reaction is complete, the final salt is usually *neutral* (neither acidic nor basic). Neutralization is one of the most important reactions in chemical analysis, and in many branches of industry. Processes that go on in the human body include neutralization.

Acids and bases in water solution *ionize* (break down) into positive and negative ions as shown below for hydrochloric acid (HCl) and sodium hydroxide (NaOH).

$$HCl \rightarrow H^+ + Cl^- \text{ and } NaOH \rightarrow Na^+ + OH^-$$

When the acid and base react together, the hydroxide (OH^-) ion from the base combines with the hydrogen (H^+) ion from the acid to form water (H_2O).

$$H^+ + Cl^- + Na^+ + OH^- \rightarrow Na^+ + Cl^- + H_2O$$

The two remaining ions form a salt that usually stays in solution as ions. If the water is evaporated, the salt can be recovered in crystal form. Roger D. Barry

Neutrino is any of three types of subatomic particles that have no electric charge. Experiments have shown that neutrinos have some *mass* (amount of matter). However, the masses of neutrinos are so small that scientists have not yet been able to measure them directly. A neutrino has no more than 1 millionth the mass of an *electron,* the lightest particle that has an electric charge.

Neutrinos travel at or near the speed of light. They are produced in reactions that occur in the *decay* (breaking apart) of unstable subatomic particles or nuclei. They are also created in reactions that produce energy in the sun and other stars. In addition, machines known as *particle accelerators* can produce neutrinos.

Neutrinos belong to the *lepton* family of particles. The other leptons carry an electric charge and have mass. They are, from the lightest to the heaviest, the electron, the *muon,* and the *tau.*

A neutrino can change into a charged lepton by interacting with an atomic nucleus. Each type of neutrino can change into only one kind of charged lepton. The names of the three types of neutrinos come from the names of the corresponding charged leptons. Thus, an *electron-neutrino* can change into an electron, a *muon-neutrino* into a muon, and a *tau-neutrino* into a tau.

The neutrinos also have *antimatter* counterparts called *antineutrinos* that differ from neutrinos in the direction of their *spin.* Spin is a measure of the internal rotation of a particle. There are *electron-antineutrinos, muon-antineutrinos,* and *tau-antineutrinos.*

The American physicists Frederick Reines and Clyde Cowan announced the discovery of the first neutrinos, electron-neutrinos, in 1956. In 1962, the American physicists Leon M. Lederman, Melvin Schwartz, and Jack Steinberger discovered the muon-neutrino. In 2000, an international team of scientists at Fermi National Accelerator Laboratory (Fermilab) near Batavia, Illinois, announced the first direct evidence for the tau-neutrino.

Neutrinos interact with other particles through a force called the *weak interaction.* This force is so feeble that neutrinos can pass through a large amount of matter with only a tiny chance of interacting with a particle in the matter. So, to detect enough neutrino interactions for study, researchers must build enormous detectors.

Sudbury Neutrino Laboratory

The Sudbury Neutrino Observatory consists of a large spherical water tank surrounded by sensors. The sensors detect flashes of light that occur when neutrinos interact with the water.

A detector senses a neutrino indirectly, after the neutrino interacts with a nucleus or collides with an electron. The interaction or collision releases charged particles that electronic devices can detect. But the devices can also detect other charged particles at the earth's surface. Therefore, to shield detectors from the other particles, scientists build them deep underground.

The most sensitive neutrino detector is the Sudbury Neutrino Observatory (SNO), which began operating in 1999 in a nickel mine in Ontario. The SNO detects several neutrino interactions per day. The Super-Kamiokande (Super-K) detector, in a zinc mine northwest of Tokyo, began operating in 1996 and produced much valuable data. But in 2001, an accident disabled it. A "chain reaction" of *implosions* (inward burstings) smashed most of its sensors, which resembled gigantic light bulbs. Authorities in Japan said that they would repair Super-K.

Neutrino detectors have consistently observed fewer neutrinos from the sun than expected. Data from the SNO show that the shortage occurs because electron-neutrinos created in the sun turn into other varieties as they travel through space. The changes can occur only if neutrinos have mass. Robert H. March

See also **Astronomy** (Neutrino astronomy); **Lepton; Observatory** (Neutrino observatories); **Subatomic particle.**

Neutron is a subatomic particle. Neutrons, together with subatomic particles called *protons,* form the nuclei of all atoms except ordinary hydrogen, whose nucleus consists of a single proton (see **Proton**). Neutrons and protons make up 99.9 percent of an atom's mass. A cloud of *electrons* around the nucleus accounts for the rest of the mass (see **Electron**). In the nucleus, neutrons and protons are held together by a force known as the *strong interaction* or the *strong nuclear force.*

The number of neutrons in an atom of any chemical element is equal to the difference between the element's *mass number* (total number of protons and neutrons) and its *atomic number* (number of protons). The atoms of lighter elements contain about an equal number of neutrons and protons. Heavier elements contain more neutrons than protons.

Neutrons consist of fundamental particles called *quarks* (see **Quark**). A neutron has no electric charge. Its diameter is approximately one millionth of a nanometer. One nanometer equals one millionth of a millimeter, or $\frac{1}{25,400,000}$ inch. The mass of a neutron is slightly greater than that of a proton. A free neutron decays into a proton, an electron, and an antineutrino. Free neutrons have an average life span of about 15 minutes.

Sir James Chadwick, a British physicist, discovered the neutron in 1932. Today, scientists use neutrons to make various elements radioactive. They bombard atoms of the elements with neutrons in a nuclear reactor. After the nuclei of the atoms absorb neutrons, they decay by giving off radiation. When a nucleus of the uranium isotope U-235 is struck by a neutron, it becomes unstable and splits into two nearly equal parts. This process, called *fission,* releases a huge amount of energy and frees additional neutrons that cause more uranium nuclei to fission. A continuous series of such fissions, called a *nuclear chain reaction,* produces the energy in nuclear weapons and reactors. Edward S. Fry

Neutron star is the smallest and densest type of star known. Neutron stars measure only about 12 miles (20 kilometers) across, but they have even more matter than the sun.

A neutron star forms when a large star—six to eight times more massive than the sun—runs out of fuel to burn. Because of its intense gravitational force, the star collapses. Gravity squeezes together the protons and electrons in the core of the star. As a result, the protons and electrons combine to form neutrons. The neutrons may, in turn, break down into elementary particles called *quarks.* The star then explodes as a *supernova,* throwing off its outer layers and leaving behind a spinning core—a neutron star. The core has a mass greater than 1.4 times, but less than 3 times, that of the sun. See **Supernova.**

A neutron star has a magnetic field billions of times stronger than the most powerful magnets on earth. This magnetic field acts like a particle accelerator. It creates an electric field that rips electrons and protons from the star's surface. In some cases, these particles produce a beam of radio waves, X rays, or other radiation that flows from the star.

Physicists predicted the existence of neutron stars in 1938. The prediction was only a theory until 1967, when radio telescopes in England picked up regular bursts of radio waves from an object in space. Scientists later concluded that such objects, called *pulsars,* are actually neutron stars (see **Pulsar**). Daniel R. Stinebring

Red Rock Canyon, near Las Vegas, typifies the rugged desert land that covers most of the state. Nevada receives less rainfall than any other state. More than 150 mountain ranges rise throughout Nevada.

Nevada *The Silver State*

Nevada, *nuh VAD uh* or *nuh VAH duh,* is a state in the Western United States. It is a popular center of tourism. Nevada is the only state whose laws allow most kinds of gambling throughout the state. Large, luxurious gambling casinos attract visitors from all parts of the world to Lake Tahoe, Las Vegas, and Reno. Las Vegas is the largest city in Nevada and the chief tourist attraction in the state.

Nevada is a land of rugged snow-capped mountains, grassy valleys, and sandy deserts. Pine forests cover many mountain slopes, and crystal-clear streams flow through steep, rocky canyons. Large trout swim in sparkling valley lakes. In many places, geysers erupt and hot springs gush amid the rocks. In the south, bighorn sheep graze on jagged plateaus that glow red in the brilliant sunshine. Glistening white patches called alkali flats stretch across the deserts. The flowers of cactus, yucca, and sagebrush plants add splashes of color. The gray-green sagebrush gave Nevada one of its nicknames, the *Sagebrush State.* The United States government maintains a testing center for nuclear weapons in the Nevada desert.

The state's most common nickname, the *Silver State,* comes from the vast amounts of silver that were once taken from its many mines. Colorful ghost towns and historic mining towns, such as Virginia City, now attract thousands of tourists to the state every year. But mining is still one of the chief industries of Nevada. The most important minerals in the state include diatomite, gold, petroleum, sand and gravel, and silver. These resources support the state's manufacturing and processing industry.

Less rain falls in Nevada than in any other state. As a result, farming depends on irrigation. The Newlands Irrigation Project, near Reno, was the first system of its kind built by the federal government. Hoover Dam, on the Colorado River, created Lake Mead, one of the

The contributors of this article are Christopher H. Exline, Professor and Chairman of the Department of Geography at the University of Nevada, Reno; and James W. Hulse, Professor of History at the University of Nevada, Reno.

Interesting facts about Nevada

The city of Aurora once took part in elections in two states. When the city was first settled, its inhabitants were not sure whether it was part of Nevada or California. Elections were held in 1863, and the citizens of Aurora selected candidates for offices in both states. A survey later determined that Aurora was in Nevada.

Reuel C. Gridley, an Austin grocer, collected $275,000 in 1864 by auctioning a single sack of flour over and over again. He gave all the money to the Sanitary Fund of the U.S. Sanitary Commission, the forerunner of the American Red Cross.

Gridley sack of flour

Several rare species of fish live in Nevada, the driest of the 50 states. These species include the cui-ui, a large sucker found only in Pyramid Lake, and the Devils Hole pupfish, which is found only in Devils Hole. These fish evolved separately from more common fish as a result of becoming isolated as prehistoric lakes dried up.

The only United States coins with a double mint mark were those produced by the U.S. Mint at Carson City from 1870 to 1893. They bore the mark *CC.* Gold coins, such as double eagles (face value $20), eagles ($10), and half eagles ($5), carried the distinctive mark. Silver coins, such as dollars, trade dollars, and half dollars, also had the double mint mark.

The federal government owns about 80 percent of Nevada's land. This is the largest percentage of any of the 50 states. Agencies that control the land include the Bureau of Land Management, the Fish and Wildlife Service, the Forest Service, the National Park Service, the United States Navy, and the United States Air Force.

Las Vegas is Nevada's largest city and chief tourist attraction. Caesar's Palace, shown here, is one of the city's many large, luxurious hotels and gambling casinos. Las Vegas's colorful entertainment and night life draw visitors from many parts of the world.

largest artificially created lakes in the world. The dam's power plant supplies electric power for Arizona, California, and Nevada.

Nevada's main crops are alfalfa seed, hay, potatoes, and wheat. Cattle and sheep graze on vast ranches in the central and eastern areas of Nevada. Ranchers also feed their herds on public lands owned by the United States government. The U.S. government owns about 80 percent of the state's land.

Nevada lies mainly on a broad, rugged highland between the Rocky Mountains and the Sierra Nevada mountain range. In the 1820's and 1830's, the trappers Peter S. Ogden, Jedediah S. Smith, and Joseph Walker explored parts of the region in search of new fur sources. John C. Frémont began the first thorough exploration in 1843. By the 1860's, discoveries of gold and silver had brought thousands of miners to the area.

The name *Nevada* comes from a Spanish word meaning *snow-clad.* Miners and other settlers chose the name Nevada when the region became a territory in 1861. Nevada became a state in 1864 during the Civil War and was nicknamed the *Battle Born State.*

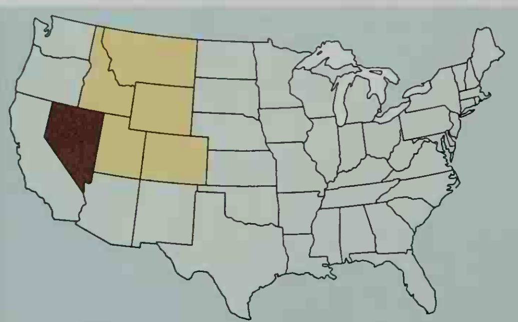
© James Blank, West Stock

Lake Tahoe is a beautiful lake that lies in a valley of the Sierra Nevada mountains west of Carson City. Many people visit the lake to enjoy swimming, boating, and water-skiing.

Nevada in brief

Symbols of Nevada

The state flag, adopted in 1929, bears a silver star. The words *Battle Born* signify Nevada's admission to the Union during the Civil War. On the state seal, adopted in 1866, a railroad and a telegraph line symbolize Nevada's importance as a corridor between the Midwest and the West Coast. A tunnel, an ore cart, and an ore-crushing mill stand for the state's mineral wealth. A plow, a sickle, and a sheaf of wheat represent agriculture.

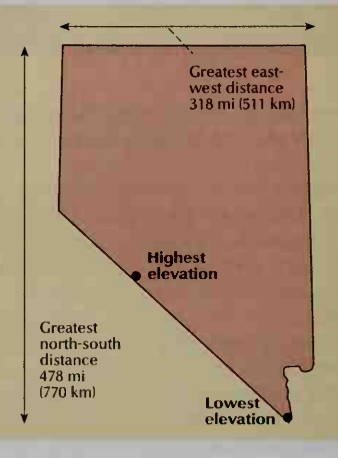


State flag

State seal

Nevada (brown) ranks seventh in size among all the states and second among the Rocky Mountain States (yellow).

General information



Statehood: Oct. 31, 1864, the 36th state.
State abbreviations: Nev. (traditional); NV (postal).
State motto: *All for Our Country.*
State song: "Home Means Nevada." Words and music by Bertha Raffetto.

The State Capitol is in Carson City, Nevada's capital since the Nevada Territory was created in 1861.

Land and climate

Area: 110,567 mi² (286,367 km²), including 761 mi² (1,971 km²) of inland water.
Elevation: *Highest*—Boundary Peak, 13,140 ft (4,005 m) above sea level. *Lowest*—470 ft (143 m) above sea level along the Colorado River in Clark County.
Record high temperature: 125 °F (52 °C) at Laughlin on June 29, 1994.
Record low temperature: −50 °F (−46 °C) at San Jacinto on Jan. 8, 1937.
Average July temperature: 73 °F (23 °C).
Average January temperature: 30 °F (−1 °C).
Average yearly precipitation: 9 in (23 cm).

Important dates

1825-1830 Peter S. Ogden reached the Humboldt River. Jedediah S. Smith crossed southern Nevada.

1848 The U.S. received Nevada and other southwestern lands from Mexico under the Treaty of Guadalupe Hidalgo.

1859 The discovery of silver near Virginia City brought a rush of prospectors to western Nevada.

1864 Nevada became the 36th state on October 31.

Sources of information

For information about tourism, write to: Nevada Commission on Tourism, 401 N. Carson Street, Carson City, NV 89701. The Web site at www.travelnevada.com also provides information.
For information on the economy, write to Commission on Economic Development, 108 E. Proctor Street, Carson City, NV 89701-4240.
The state's official Web site at www.state.nv.us also provides a gateway to much information on Nevada's economy, government, and history.

1931 The Nevada Legislature made gambling legal in the state.
1936 Boulder Dam (now Hoover Dam) was completed.
1963 The U.S. Supreme Court specified how much water the states of Arizona, California, and Nevada could draw from the Colorado River.
1980 The Nevada Legislature passed conservation laws to protect Lake Tahoe from pollution.

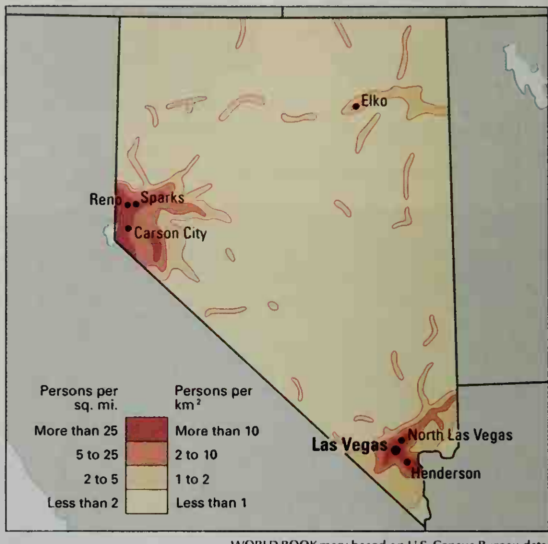
People

Population. The 2000 United States census reported that Nevada had 1,998,257 people. The population had increased 66 percent over the 1990 figure, 1,201,833—by far the greatest percent increase of any of the states. According to the 2000 census, Nevada ranks 35th in population among the 50 states.

About 96 percent of Nevada's people live within the Las Vegas and Reno metropolitan areas (see **Metropolitan area**). The Las Vegas metropolitan area includes all of Clark and Nye counties in Nevada and Mohave County in Arizona. Over three-fourths of the people live within 50 miles (80 kilometers) of Las Vegas, Nevada's largest city. About a fifth of the people live within 30 miles (50 kilometers) of Reno, the state's second largest city.

Outside of Las Vegas and Reno, only eight of Nevada's urban areas have populations greater than 25,000. These areas are Henderson, North Las Vegas, Paradise, Spring Valley, Sunrise Manor, and Winchester, near Las Vegas; Sparks, near Reno; and Carson City, the state capital.

Hispanics account for about 20 percent of Nevada's population. African Americans make up about 7 percent.



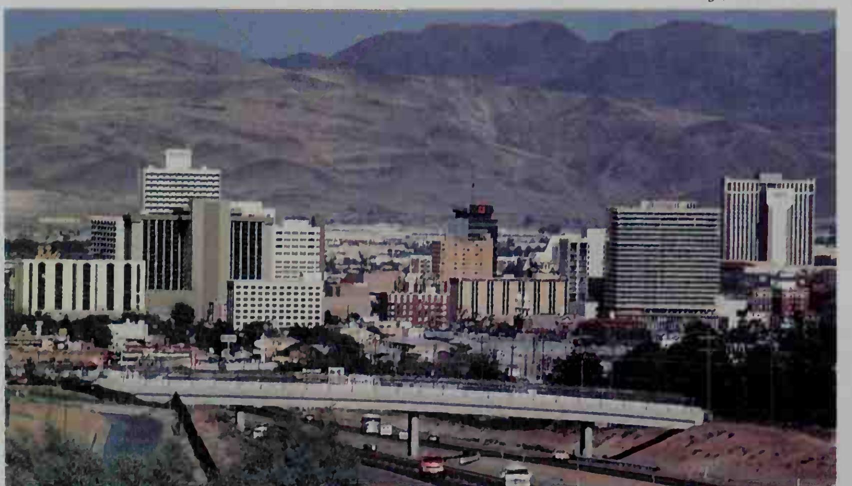
People living in Las Vegas depend mainly on the tourist and gambling industries for their income. Las Vegas is famous for its gambling casinos and its nightclubs. Reno, another tourist favorite, is the center of banking, commerce, and transportation in northern Nevada.

Schools. The people of Nevada made plans for a tax-supported school system as early as 1861, when Nevada became a territory. In 1865, the year after Nevada became a state, the Legislature established the first school districts. Nevada had to overcome unusual problems in developing its public school system. Rural areas were thinly populated. In some places, taxpayers supported schools for as few as three or four school-age children living in a vast area. Some early schools were open only six months of the year because of a lack of funds. Until 1900, the state had only a few high schools. In some parts of Nevada, elementary school students still attend one-room schools.

In 1956, the Nevada Legislature made each of the state's counties a school district. A board of education supervises Nevada's school system. The board consists of 11 members. The voters elect the board members to

Population density

Nevada has a population of almost 2 million people. About 96 percent of the state's people live in or near Nevada's largest cities, Las Vegas and Reno.



WORLD BOOK map; based on U.S. Census Bureau data.

The Reno skyline rises against the dramatic backdrop of the Virginia and Pah Rah mountain ranges. Reno is Nevada's second largest city.

four-year terms. The board selects a superintendent of public instruction.

In addition, each of Nevada's school districts has its own elected board of education. Children are required to attend school from ages 7 through 16. For the number of students and teachers in Nevada, see **Education** (table).

Nevada has two institutions of higher learning that grant bachelor's or advanced degrees and are accredited by the Northwest Association of Schools and Colleges. The institutions are Sierra Nevada College in Incline Village and the University of Nevada, which has campuses in Las Vegas and Reno.

Libraries. The University of Nevada has two of the largest libraries in the state on its campuses in Las Vegas and Reno. The Nevada State Library and Archives in Carson City serves as the official library for the state government and also as the reference and research center for other libraries throughout the state. Nevada has about 80 public libraries.

Museums. The Las Vegas and Reno Nevada Historical Society museums display many items that were used by early Nevadans. The Nevada State Museum, located in Carson City, displays examples of Nevada wildlife in addition to historical relics. This museum also features life-sized mining exhibits built in tunnels beneath the building. The exhibits illustrate blasting, drilling, hoisting, and other mining operations.

The Lost City Museum in Overton has many items found at the Pueblo Grande de Nevada, an ancient Indian settlement. Lake Mead now covers part of the site of the ancient city.

The Old Las Vegas Mormon Fort Historic Park displays relics of the Mormon pioneers. The University of Nevada, Las Vegas, operates a museum of natural history. The Northeastern Nevada Museum in Elko offers historical displays of Indian artifacts, natural history, and art. The National Automobile Museum in Reno features a collection of antique, classic, vintage, and special interest vehicles.

The Nevada Museum of Art in Reno houses a collection of art dealing with human beings and the environment. The Las Vegas Museum of Art displays paintings and sculpture by regional, national, and international artists. Galleries at the University of Nevada in Las Vegas and Reno feature changing collections of artwork.

Gambling and the colorful night life in Las Vegas and Reno draw millions of tourists every year. Virginia City and other historic Nevada towns remind travelers of the prospectors who came west seeking fortunes in gold and silver. Sports enthusiasts hunt mule deer and chukar partridge, and fish for catfish, bass, salmon, and trout. Skiers race down the snow-covered slopes of the Lake Tahoe basin and the Sierra Nevada near Reno, and Mount Charleston near Las Vegas. Vacationers also enjoy swimming and water skiing at Lake Mead, Lake Tahoe, and Pyramid Lake.

Thousands of classic and vintage automobiles arrive in Reno the first week of August for Hot August Nights, one of Nevada's largest annual events. Visitors can admire the cars as they are paraded and displayed at numerous shows and events.

Bob and Ira Spring

Virginia City, a famous Western historic mining town

Places to visit

Following are brief descriptions of some of Nevada's most interesting places to visit:

Austin, a city in central Nevada, has authentic buildings from its days as a bustling mining settlement.

Bowers Mansion, a large Italian-style home near Carson City, was built by "Sandy" Bowers, a silver miner who made a fortune from the Comstock Lode.

Fleischmann Planetarium at the University of Nevada in Reno shows realistic motion pictures of space adventures and of hurricanes, tornadoes, and other weather conditions.

Hoover Dam, about 25 miles (40 kilometers) southeast of Las Vegas, is one of the world's largest concrete dams. See **Hoover Dam**.

Pioche, a famous county seat about 130 miles (210 kilometers) north of Las Vegas, has a historic courthouse and many remnants of its colorful past as a mining town in the 1800's.

Ruby Mountains are in a scenic region southeast of Elko. The area features skiing, hiking trails, fishing, hunting, and camping. Nearby Lamoille Canyon was formed by glaciers.

National parks and forests. Great Basin National Park lies in east-central Nevada. It includes rugged Wheeler Peak, 3,000-year-old bristlecone pines, and limestone caves. Wildlife in the park includes eagles and bighorn sheep (see **Great Basin National Park**). Humboldt-Toiyabe National Forest surrounds the park. Inyo National Forests is partly in Nevada and partly in California. The northeast corner of Death Valley National Park extends into Nevada from California (see **Death Valley National Park**). The National Park Service maintains Lake Mead as a national recreation area (see **Lake Mead**).

State parks. Nevada has a total of 19 state parks, monuments, and recreational areas. The largest is the Valley of Fire, near Overton. The rocks in this park have been worn into odd shapes by the weather. For example, Elephant Rock has the shape of an elephant's head. Berlin-Ichthyosaur State Park, near Gabbs, features the ruins of an abandoned mining town. Lake Tahoe State Park lies on the edge of Lake Tahoe, which is 6,200 feet (1,900 meters) above sea level. For information about Nevada's state parks, special events, and activities, write to Nevada Commission on Tourism, 401 North Carson Street, Carson City, NV 89701.

National Championship Air Races in Reno

Land and climate

Land regions. Nevada lies almost entirely within the Great Basin, a huge desert area that extends into Oregon, Idaho, Wyoming, California, and Utah (see **Great Basin**). The state has three main land regions: (1) the Columbia Plateau, (2) the Sierra Nevada, and (3) the Basin and Range Region.

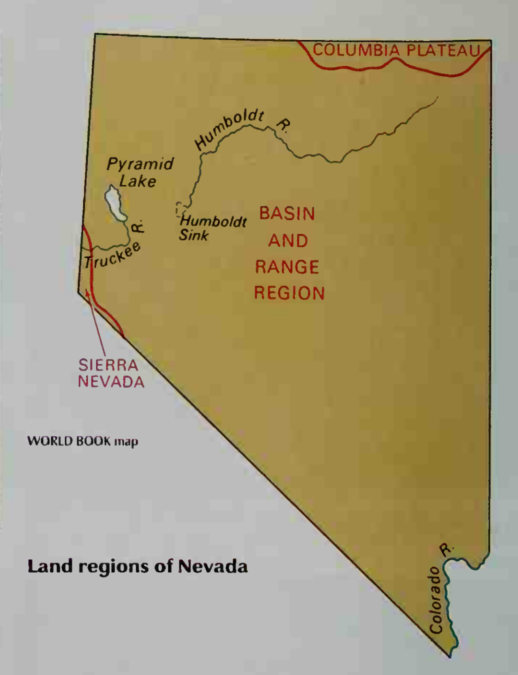
The Columbia Plateau covers a small part of the northeastern corner of Nevada. Deep lava bedrock lies under the entire region. Streams and rivers have cut deep canyons, leaving steep ridges. The land flattens into open prairies near the Idaho border.

The Sierra Nevada, a rugged mountain range, cuts across a corner of the state west and south of Carson City. Lake Tahoe and other mountain lakes in this part of Nevada attract many vacationers each year. See **Sierra Nevada.**

The Basin and Range Region covers the remainder of the state. It consists mainly of an upland area broken by more than 150 north-south mountain ranges. The towering Sierra Nevada marks part of the western edge of the region. The Toiyabe and Toquima ranges rise in the center of the state. In the east are the Snake and Toana ranges. Between the mountains lie *buttes* (lone hills) and *mesas* (tablelike mountains), as well as flat valleys with lakes or alkali flats (see **Butte; Mesa**).

The elevation of the Basin and Range Region varies from less than 500 feet (150 meters) above sea level near the Colorado River to more than 13,000 feet (3,960 meters) in the southwest. Boundary Peak, the highest point in Nevada, rises 13,140 feet (4,005 meters) in Esmeralda County near the California border. Hot springs and geysers in many places show that Nevada is an area of dying volcanoes.

The southeastern tip of the Basin and Range Region is not part of the Great Basin. But the land here closely resembles that of the Great Basin.



Rivers and lakes. Most of Nevada's rivers are small and flow only during the wet season, from December to June. Only a few of the state's rivers have outlets to the sea. The Virgin and Muddy rivers join the Colorado in the southeastern tip of Nevada. The Owyhee (pronounced *oh WYE ee*), Bruneau, and Salmon rivers flow northward across the Columbia Plateau to Idaho's Snake River.

All of Nevada's other rivers empty into the Great Basin. They flow into lakes without outlets or into wide, shallow *sinks* (low spots in the earth). In summer, the water evaporates from the sinks and leaves salty mud flats and dry lakes. The snow-fed Humboldt River is the state's longest river. It flows westward from the mountains of Elko County for about 300 miles (480 kilometers) and empties into Humboldt Sink. The Carson River winds northeastward from California and empties into Carson Sink. The Walker River also rises in California

Jeff Gnass, West Stock

Lake Mohave is an artificial lake that forms part of the border between Nevada and Arizona. Engineers created the lake by building Davis Dam across the Colorado River.

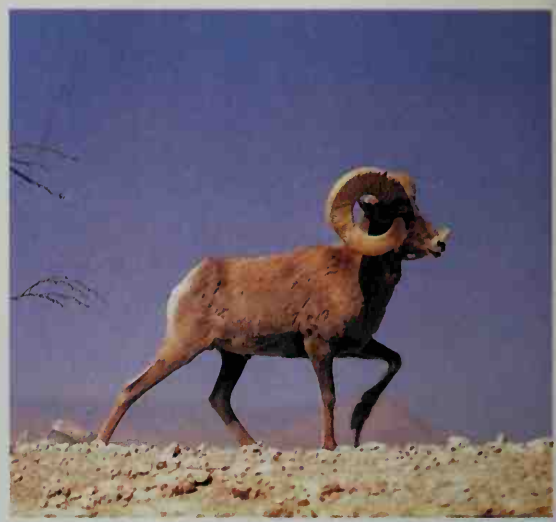
and empties into Walker Lake. The scenic Truckee River flows northeastward from Lake Tahoe and empties into Pyramid Lake.



Lake Tahoe, on the Nevada-California border, is one of the nation's loveliest lakes. Lamoille, Liberty, and other beautiful lakes lie among the peaks of the Ruby Range in Elko County. Ruby and Franklin lakes are at the eastern foot of the Ruby Range. Pyramid Lake and Walker Lake are the remains of Lake Lahontan, an ancient lake that gradually dried up. Thousands of years ago, Lake Lahontan covered about a tenth of the present state of Nevada.

Lake Mead, an artificially created lake, is the only Nevada lake with an outlet to the sea. Engineers formed this vast reservoir by building Hoover Dam across a canyon of the Colorado River.

Plant and animal life. Broad stretches of forests cover Nevada's mountainsides. Common trees include alders, aspens, cottonwoods, firs, hemlocks, junipers, pines, spruces, and willows.

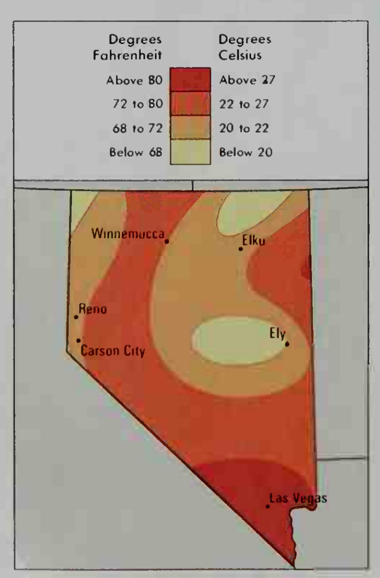
Nevada's deserts are dotted with cactus, yucca, and a variety of low brush plants. The most common desert plants include the bitter brush, mesquite, rabbit brush, sagebrush, and shadscale. Grasses grow in mountain and valley meadows. Nevada's meadows bloom in spring with Indian paintbrush, larkspur, shooting stars, and violets. In early spring, blood-red blossoms of the snow plant push through the snow in the pine forests. Wild peach blossoms and desert lilies brighten Nevada's foothills in spring and summer.

Nevada has few large animals, but hundreds of small animals live in the state. Mule deer roam the mountain forests. Pronghorns live mainly in the Charles Sheldon Antelope Refuge in Washoe County. Bighorn sheep climb the steep, rocky slopes of the Sheep Range in Clark County. Nevada's small animals include badgers, coyotes, foxes, minks, marmots, muskrats, porcupines, rabbits, and raccoons. Several kinds of lizards and snakes live in the desert. Game birds include chukar partridges, ducks, geese, pheasants, quail, and sage hens. Hundreds of white pelicans nest in the Anahoe Island Refuge in Pyramid Lake. Several kinds of trout make the state a favorite fishing spot. The *cui-ui* is a large sucker found only in Pyramid Lake. It was once an important food fish among the local Indians. Other fishes that swim in Nevada waters include bass, carp, catfish, and crappies.

Leonard Lee Rue III, Shostal

Bighorn sheep in Nevada live on the steep, rocky slopes of the Sheep Range north of Las Vegas. Bighorn sheep, mule deer, and pronghorns are the state's largest wild animals.

Average January temperatures



The northeast has long, cool winters. Milder temperatures are found in the south and in the Reno-Carson City area.

Climate. Nevada has less *precipitation* (rain, melted snow, and other forms of moisture) than any other state. An average of only 9 inches (23 centimeters) of precipitation falls in Nevada annually. The driest regions of the state include the southeastern tip and the land near Carson Sink.

The rainiest parts of Nevada are in the Sierra Nevada and the eastern foothills of these mountains. As much as 25 inches (64 centimeters) of rain falls annually in the Lake Tahoe region of the Sierras. Most of the rain falls during winter. Clouds moving eastward from the Pacific Ocean bring the rain. But the clouds lose most of their moisture in California as they rise over the high Sierra Nevada.

Snowfall varies widely in the state. It ranges from about 300 inches (750 centimeters) a year in the highest sections of the Sierras to about 1 inch (2.5 centimeters) a year in the southeastern part of the state.

Nevada has a wide range of temperatures. The north and the mountains in all sections have cold, long winters and short, hot summers. The west has short, hot summers, but winters there are only mildly cold. In southern Nevada, summers are long and hot, and winters are mild.

July temperatures average about 70 °F (21 °C) in the north and in the mountains, and 86 °F (30 °C) in the extreme south. January temperatures average 24 °F (−4 °C) in the north and 43 °F (6 °C) in the south. The temperature often changes greatly during the day. In Reno, for example, the temperature may change more than 45 degrees Fahrenheit (25 degrees Celsius) on a summer day. The highest temperature ever recorded in Nevada was 125 °F (52 °C) at Laughlin on June 29, 1994. The temperature reached a record low of −50 °F (−46 °C) at San Jacinto on Jan. 8, 1937.

Economy

Nevada's work force nearly doubled in size in the 1990's. But the distribution of workers did not change significantly. Service industries remain, by far, Nevada's most important industry group. Heavy tourist spending benefits such service establishments as hotels, restaurants, and ski resorts. Agriculture and manufacturing are less important in Nevada than they are in most other states. Gold is Nevada's most important mined product.

Natural resources. Nevada's chief natural resources are its vast mineral deposits, wildlife, and beautiful scenery. In some areas of Nevada, poor soil and lack of water make it difficult or impossible to raise field crops. Thick grasses in some valleys provide grazing for cattle.

Soil. Most of Nevada is covered with a grayish-brown soil. Many areas have sparse coverings of grasses and brush. With irrigation, Nevada's soil can grow grain, hay, and other crops. In some valleys, thick layers of sodium carbonate form gleaming white alkali flats, where nothing grows. These flats are sometimes called *playas* or *dry lakes* because they may be covered with water after a storm. Much of southern Nevada is covered by light gray soil high in lime or gypsum. Much of the northern section has dark soil formed from volcanic rock.

Water. Nevada has a limited water supply because of its light rainfall. Water must be carefully conserved when used for personal needs and irrigation. Farmers and ranchers pump underground water for their crops and livestock in the Carson, Diamond, Fish Lake, Mason, Smith, Spring, and White River valleys. The largest irrigation systems operate along the rivers. The Newlands system includes the Lahontan Reservoir, which stores water from the Carson and Truckee rivers. It provides irrigation water for about 75,000 acres (30,400 hectares) in Churchill and Lyon counties. Other large irrigation projects include Rye Patch Dam on the Humboldt River, Topaz Reservoir on the Walker River, and Wild Horse Dam in the Owyhee River Valley. The Robert B. Griffith Water Project provides Lake Mead water to the Las Vegas area.

Minerals. Huge deposits of copper lie in Lander, Lyon, and White Pine counties. Humboldt County is a leading mercury producer. Central and northwestern

Production and workers by economic activities

Economic activities	Percent of GSP* produced	Employed workers: Number of people	Employed workers: Percent of total
Community, business, & personal services	32	470,700	41
Finance, insurance, & real estate	18	88,600	8

Total	100	1,135,300	100

*GSP = gross state product, the total value of goods and services produced in a year.
Figures are for 1998.
Sources: *World Book* estimates based on data from U.S. Bureau of Economic Analysis and U.S. Bureau of Labor Statistics.

Gambling casinos such as this one in Reno attract millions of tourists to Nevada each year. The tourist industry provides the state's single greatest source of income.

Tim Heneghan, West Stock

Nevada have large tungsten deposits. Gold and silver have been found in many areas. Other mined resources include barite, borates, clays, diatomite, iron ore, lead, lithium, magnesite, manganese, molybdenum, perlite, salt, uranium, and zinc. Nevada also has valuable deposits of gypsum, limestone, and sand and gravel. Petroleum has been found in some eastern areas of the state.

Service industries account for the largest portion of Nevada's *gross state product*—the total value of goods and services produced by a state in a year. These industries are more important to Nevada's economy than they are to the economies of most other states. Most of Nevada's service industries are concentrated in the Las Vegas and Reno metropolitan areas. The tourist trade contributes heavily to the service industries in these areas.

Community, business, and personal services rank as the leading service industry in Nevada. This industry group accounts for about a third of the gross state product, a higher percentage than in any other state. It also employs more people than any other industry in Nevada. The community, business, and personal services industry group includes gambling—which is legal in the state—and other services in the field of amusement and recreation. Other activities in this broad industry group include the operation of private schools and hospitals; advertising and data processing firms; and cleaning establishments, hotels, and repair shops.

Every year, more than 40 million visitors enjoy Nevada's night life, lovely scenery, and exciting sports. Nevada is one of the leading states in attracting visitors from other countries. Tourist activities contribute billions of dollars to the state annually. Though gambling is legal throughout the state, about 90 percent of Nevada's large casinos are in Las Vegas, Reno, and the Lake Tahoe area. Forms of gambling include slot machines, blackjack, keno, poker, roulette, and dice games. Well-known entertainers from the United States and Europe appear in floor shows at casinos and nightclubs. Many casinos never close. Dude ranches, fishing resorts, and hunting lodges operate in many areas of the state.

Finance, insurance, and real estate form the second-ranking service industry in Nevada in terms of the gross state product. Real estate has become the most important part of this industry group as more and more people move to the state. Nevada grew faster than any other state during the 1990's. Nevada's main financial centers are Las Vegas and Reno.

Wholesale and retail trade rank third among the state's service industries. The wholesale trade of automobiles, food products, and minerals is important in Nevada. Stores and restaurants are the main types of retail establishments. Spending by tourists benefits Nevada's retail businesses.

Government ranks fourth among Nevada service industries. Government services include the operation of public schools, public hospitals, and military bases. The federal government plays a major role in Nevada's economy because it owns most of the state's land. Two federal government facilities, the Nevada Test Site and Nellis Air Force Base, employ thousands of people. The Nevada Test Site is a nuclear weapons testing facility in Nye County.

Transportation, communication, and utilities rank fifth among service industries in Nevada. Trucks are the main means of transporting freight in the state. Railroads also transport much freight. Telephone companies are the most important part of the communications sector. Utility companies supply electric, gas, and water service. More information about transportation and communication appears later in this section.

Mining. Gold is Nevada's most valuable mined product, accounting for more than two-thirds of the total mining income. Nevada mines about three-fourths of all the gold produced in the United States. The largest gold mines are located in the north-central part of the state in Elko, Eureka, and Lander counties. Several other Nevada counties produce significant amounts of gold. Nevada also leads all states in the production of silver. The northwestern part of the state is the leading silver-producing region, especially the area just east of Lovelock.

Among Nevada's other mined products, diatomite and barite are the most important. Diatomite is a chalky substance used mainly to make filters for liquids. Most of the state's diatomite is obtained from areas that were once lakes in western Nevada. Barite is used to create special fluids for the oil well drilling industry. Barite mines operate in Lander County. Nevada also produces clays, copper, gypsum, limestone, lithium carbonate, magnesite, oil, salt, and sand and gravel.

Manufacturing. Goods made in Nevada have a *value*

added by manufacture of about $3 $\frac{1}{2}$ billion a year. Value added by manufacture represents the increase in value of raw materials after they become finished products. Leading manufactured products in the state of Nevada include printed materials, food products, concrete, and machinery. Exports from Nevada manufacturers exceed $500 million each year.

The Carson City, Las Vegas, and Reno areas are the chief manufacturing centers in the state. The Las Vegas and Reno areas have meat-packing facilities, plants that manufacture concrete, and printing and publishing companies. Plants in Reno also make electronic and computer equipment, and plastics. Factories in Sparks manufacture metal products and pet food. The Las Vegas metropolitan area has plants that manufacture processed foods, lumber products, appliances, and neon signs. A plant in Minden makes electrical machinery and equipment. Henderson has a number of chemical-processing plants and electronics factories. Companies in Carson City produce computers, construction equipment, and plastic products.

Agriculture. Livestock ranching is the chief agricultural activity in Nevada. Ranches and farms cover about an eighth of the state. Nevada has about 2,500 farms and ranches.

Most of Nevada's large cattle and sheep ranches are in Elko, Eureka, Humboldt, Lander, and White Pine counties. Many ranchers graze their animals for part of the year on public lands that they rent from the federal government. Ranchers sell the majority of their cattle to farmers in California, Idaho, Nevada, and the Midwestern States. Livestock owners also sell sheep, hogs, and lambs to meat packers, and wool to textile mills. Milk comes from Yerington and from areas near Reno and Las Vegas.

Irrigated farms operate chiefly near the river valleys of northern, western, and southeastern Nevada. However, irrigated farming projects have been developed throughout the state. Hay, which is used to feed livestock, is Nevada's most valuable field crop. The state's northwestern basins are the leading region for growing hay. Farmers also raise alfalfa seed, barley, onions, potatoes, and wheat.

Electric power. Coal-burning plants provide the majority of Nevada's electric power. Water power, gas, and oil are also used to generate electric power. Coal-burning plants operate near Las Vegas and Reno and in the east-central part of the state. Hydroelectric plants at the Davis, Hoover, and Parker dams on the Colorado River provide much of the power for southern Nevada. Geothermal plants, which are powered by underground steam, operate in Churchill, Elko, and Washoe counties.

Economy of Nevada

This map shows the economic uses of land in Nevada and where the leading farm and mineral products are produced. Major manufacturing centers are shown in red.

David R. Frazier

Gold mining ranks as Nevada's most valuable mining activity. Nevada leads the nation in gold production. This engineer is laying out a surface mine near Elko.

Transportation. McCarran International Airport, in Las Vegas, is one of the busiest airports in the world. Reno also has a major airport. Four rail lines provide freight service in the state, and passenger trains serve several cities. Nevada has about 45,000 miles (72,000 kilometers) of roads and highways.

Communication. Nevada's first printed newspaper, the *Territorial Enterprise,* was established at Genoa in 1858. Mark Twain, who became one of America's greatest authors, worked as a reporter on this daily paper from 1862 to 1864, after it was moved to Virginia City.

About 35 newspapers are published in Nevada, including 10 dailies. Daily papers with the largest circulations include the *Las Vegas Review-Journal,* the *Las Vegas Sun,* and the *Reno Gazette-Journal.* Nevada publishers also produce about 25 periodicals.

Nevada has about 50 radio stations, 15 television stations, and 8 cable television systems. Most communities have Internet access. The state's first commercial radio station, KOH, began broadcasting from Reno in 1928. Nevada's first television stations, KOLO-TV in Reno and KLAS-TV in Las Vegas, began operations in 1953.

Government

Constitution of Nevada was adopted in 1864, when the state entered the Union. Nevada's Constitution may be *amended* (changed) only by a majority of the voters. An amendment proposed by the Legislature must be approved by a majority of both houses in two successive regular sessions. Then the voters must approve it in the next general election.

The people may amend the Constitution directly by using the *initiative.* In this procedure, voters who support the amendment first sign a petition. The number of signatures must equal at least 10 percent of the voters in the last general election in each of three-fourths of the counties, and at least 10 percent of the total number of voters in the last general election. The petition states the proposed amendment and calls for a general election to vote on it. If the amendment is approved by a majority of the voters at two successive general elections, it becomes part of the Constitution.

The Nevada Constitution may also be revised by a constitutional convention. To call such a convention, two-thirds of each legislative house must vote for it. Then a majority of voters must approve the convention in the next election.

Executive. The governor of Nevada is elected to a four-year term. The governor may serve no more than two terms.

Key state officials also are elected to four-year terms. Elected officials include the lieutenant governor, secretary of state, treasurer, controller, and attorney general. These officials may serve no more than two terms. The governor appoints the members of more than 150 bureaus, commissions, and administrative boards.

Legislature consists of a 21-member Senate and a 42-member Assembly. Nevada has 21 senatorial districts and 42 Assembly districts. Each senatorial district elects one senator. Each Assembly district elects one member to the Assembly. Members of the Senate serve four-year terms and may serve no more than three terms. Members of the Assembly serve two-year terms and may serve no more than six terms.

The Legislature meets on the third Monday of January in odd-numbered years. Legislators receive their salaries for 60 days, and legislative sessions are limited to 120 days. The governor can call special sessions.

Courts. The Supreme Court of Nevada has a chief justice and six associate justices, all of whom are elected to six-year terms. One or two justices are elected every two years. A justice in the final two years of his or her term normally serves as chief justice. Nevada has nine district courts, with 51 district judges who serve six-year terms. Court districts with large populations have divisions called departments. Each department is headed by a district judge. Municipal judges serve in Nevada's city courts, and justices of the peace serve in the state's townships.

Local government. Three-member boards of county commissioners govern 13 of Nevada's 17 counties. Vot-

Nevada Legislative Counsel

The Nevada Senate meets in the State Capitol in Carson City. Each of its 21 members is elected to a four-year term.

ers in Clark County elect a seven-member board, and voters in Lyon and Washoe counties elect five-member boards. A five-member board of supervisors governs Carson City, which is both a city and a county. County commissioners serve four-year terms. Other elected county officials include the assessor, auditor and recorder, clerk, district attorney, public administrator, and sheriff. The state's local government officials may serve for no more than 12 years. Most of Nevada's cities have a mayor-council form of government.

Revenue. Taxes account for about two-thirds of Nevada's *general revenue* (income). Most of the rest comes from federal grants and other U.S. government programs. A sales tax is the most important source of revenue, followed by taxes on gambling. Nevada allows many forms of gambling that are not legal in most other states. Other important sources of state revenue include taxes on alcoholic beverages, insurance, mining, motor fuel, and tobacco; and license fees for automobiles and the transportation of passengers and freight. State and local governments share revenue from a property tax. Nevada has no personal or corporate income taxes.

To attract industry, Nevada enacted a "free port" tax law in 1949. This law applies to goods being held in Nevada for shipment outside the state. It allows manufacturers to process and store such goods in Nevada without paying property taxes on them. In most states, manufacturers must pay taxes on such goods. The free port law became part of the state Constitution in 1960.

Politics. Nevada has more registered Democrats than Republicans. The Democratic Party's strength lies mainly in Clark County, where about half of the state's voters live.

In elections for governor, Democrats have won more often than Republicans. In presidential elections, voters have supported more Republican candidates than Democrats. For Nevada's votes and voting record in presidential elections, see **Electoral College** (table).

The governors of Nevada

	Party	Term
Henry G. Blasdel	Republican	1864-1871
Lewis R. Bradley	Democratic	1871-1879

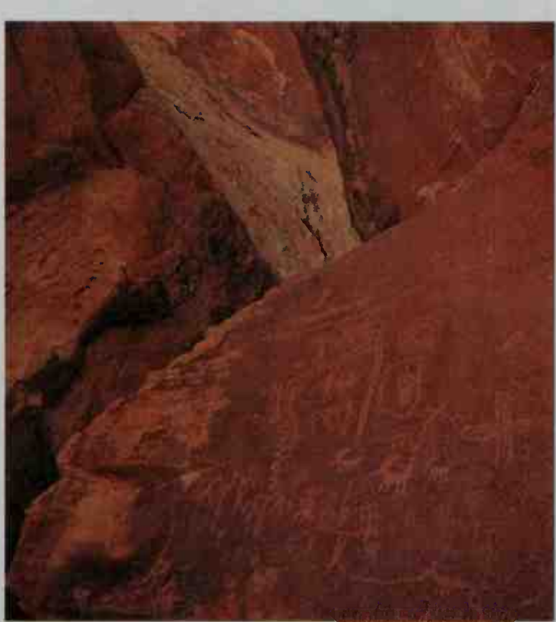
Kenny Guinn	Republican	1999-



*Silver-Democratic.

History

Indian days. Some of the earliest American Indians lived in the Nevada region. Bones, ashes, and other remains discovered near Las Vegas indicate that Indians lived there thousands of years ago. Cave-dwelling Indians left picture writings on rocks in southern Nevada. Basket Makers once lived at Lovelock Cave, and Pueblo Indians lived around Las Vegas. Explorers of the early 1800's found Mohave, Paiute, Shoshone, and Washoe Indians in parts of the region.

Exploration. Francisco Garcés, a Spanish missionary, possibly was the first white man to enter the Nevada region. He may have traveled through southern Nevada while journeying from New Mexico to California in 1776. Fur traders and trappers began to explore the region between 1825 and 1830. Peter S. Ogden explored the Humboldt River valley with a group of trappers of the Hudson's Bay Company (see **Hudson's Bay Company**). Jedediah S. Smith led some trappers across the Las Vegas valley region into California and then back across the Great Basin.

In 1830, William Wolfskill blazed a route, called the Old Spanish Trail, from Santa Fe to Los Angeles. This trail opened Nevada to trade from the southeast. Trapper Joseph Walker blazed a trail along the Humboldt River on his way to California in 1833. Hundreds of wagons rolled westward over this same trail after gold was

Picture writings were made on rocks by cave-dwelling Indians thousands of years ago in Valley of Fire State Park.

discovered in California in 1848. Between 1843 and 1845, Lieutenant John C. Frémont explored the Great Basin and Sierra Nevada. Frémont provided the first accurate knowledge of the Nevada region.

Early settlement. At the end of the Mexican War in 1848, the United States acquired the Nevada region from Mexico. Nevada was then part of a territory that also included California, Utah, and parts of four other states (see **Mexican War** [The peace treaty]).

In 1849, the Mormon leader Brigham Young organized Utah, most of present-day Nevada, and parts of other present-day states as the State of Deseret. He asked Congress to admit his state to the Union. However, in 1850, Congress established the Utah Territory, which included Utah and most of present-day Nevada. President Millard Fillmore appointed Young governor of the territory.

In 1851, Mormons from the Great Salt Lake area in Utah built a trading post at Mormon Station (now Genoa) in the Carson Valley. The post supplied provisions for gold seekers heading for California. During the next few years, a few Mormon families came to farm and raise livestock in the Carson Valley and the surrounding region. This section of Utah Territory was organized into Carson County.

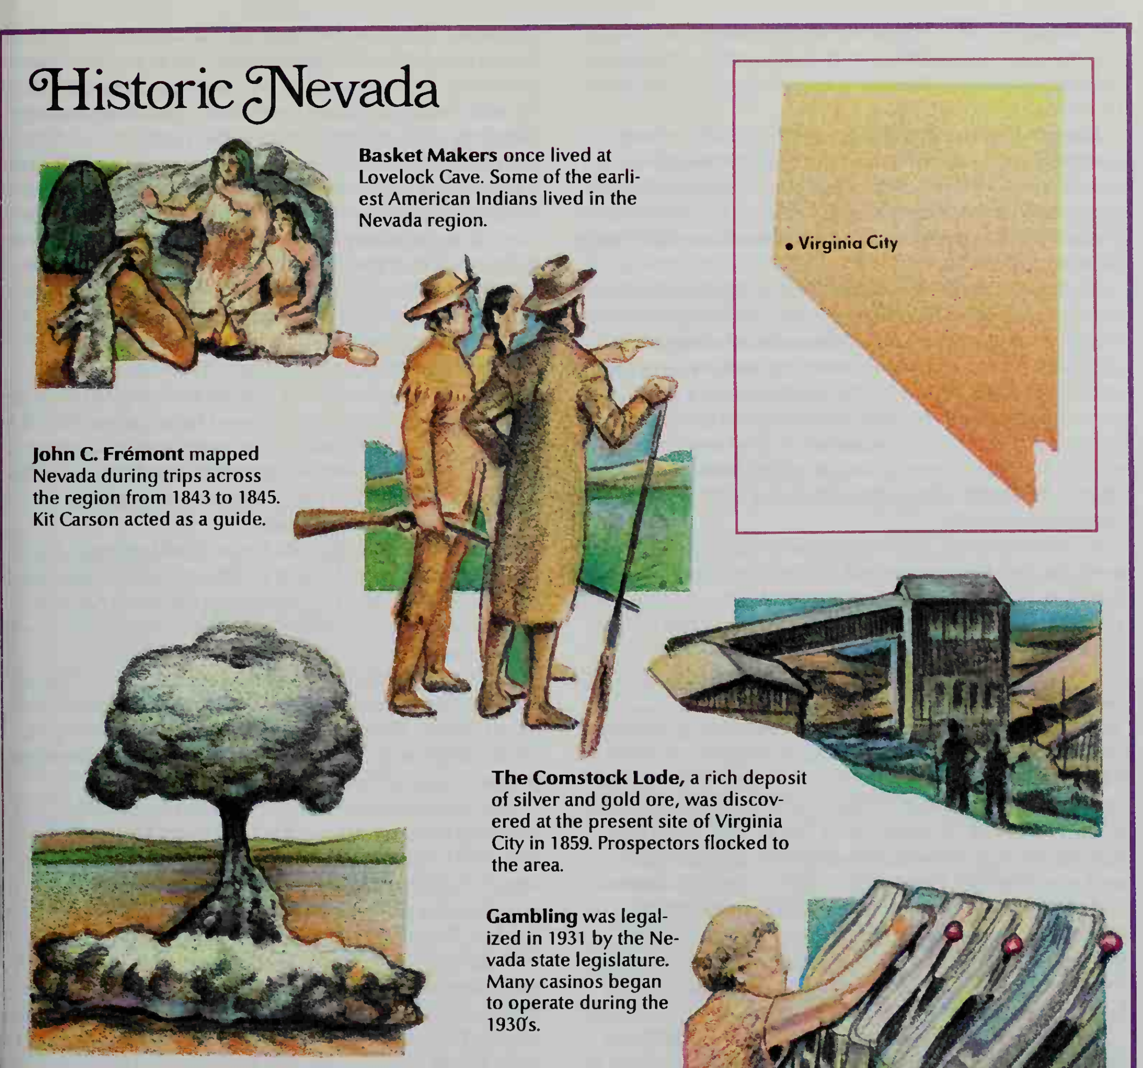
Many non-Mormons in Carson County did not want to be governed by Brigham Young. They pleaded unsuccessfully with Congress to make Carson County part of California. The Mormons themselves were troubled by a dispute with the federal government. In 1857, Young recalled the Mormon settlers to Great Salt Lake because he feared that federal troops would attack them. Two years later, the non-Mormons set up a provisional government in an attempt to establish Carson County as a separate territory. But Congress did not authorize the provisional government because only a few hundred persons lived in the Carson County area.

The Comstock Lode, a rich deposit of silver ore, was discovered in 1859 at the present site of Virginia City. Henry Comstock, a prospector, took credit for the discovery, though other miners actually had found the ore. News of the Comstock Lode quickly spread to fortune hunters in California and the Eastern United States. Hundreds of prospectors rushed to Carson County to "strike it rich," settling in tents, rough stone huts, and hillside caves. Almost overnight, Virginia City became a thriving mining center.

The settlers of the area led a difficult and dangerous life. They paid unbelievably high prices for provisions that had to be hauled from California over the Sierra Nevada. Some miners became millionaires. However, many other miners found little or no wealth. Many mining camps were lawless, and many miners were rowdies or gunmen.

Nevada becomes a territory. By 1860, the booming mining camps of Carson County held more than 6,700 people. In March 1861, President James Buchanan signed an act creating the Nevada Territory. President Abraham Lincoln, who took office two days later, appointed James W. Nye, a New York City politician, governor of the territory.

The Civil War (1861-1865) began before Nevada's territorial government could be set up in Carson City. Most Nevadans favored the North. Lincoln needed another "northern" state to support his proposed antislavery amendments. He knew that most Nevadans favored his Administration and would be likely to elect Republican senators who would support his policies. At the time, the Nevada Territory had far less than the 127,381 residents required by law to become a state. But Nevadans held a convention anyway and drew up a state constitution.



Statehood. The convention met in November 1863, but ended in failure. The voters rejected the proposed constitution because of its provisions for the taxing of mines. Congress then passed an act authorizing a second Nevada convention. In July 1864, this convention met and completed its work. In September, the revised

National Archives

Genoa in 1859 prospered by supplying provisions for prospectors on their way to Virginia City to mine silver. Genoa is Nevada's oldest permanent white settlement. It was established in 1851 as a trading post called Mormon Station.

Historic Nevada

Basket Makers once lived at Lovelock Cave. Some of the earliest American Indians lived in the Nevada region.

John C. Frémont mapped Nevada during trips across the region from 1843 to 1845. Kit Carson acted as a guide.

The Comstock Lode, a rich deposit of silver and gold ore, was discovered at the present site of Virginia City in 1859. Prospectors flocked to the area.

Gambling was legalized in 1931 by the Nevada state legislature. Many casinos began to operate during the 1930's.

Nuclear weapons testing began in 1951 at an Atomic Energy Commission center about 60 miles (97 kilometers) from Las Vegas.

Important dates in Nevada

1776 Francisco Garcés, a friar, may have become the first white person to enter the Nevada region.

1825-30 Peter S. Ogden discovered the Humboldt River. Jedediah S. Smith crossed southern Nevada.

1843-45 John C. Frémont and Kit Carson explored the Great Basin and Sierra Nevada.

1848 The United States received Nevada and other lands in the Southwest from Mexico under the Treaty of Guadalupe Hidalgo.

1859 The discovery of silver near Virginia City brought a rush of prospectors to western Nevada.

1861 Congress created the Nevada Territory.

1864 Nevada became the 36th state on October 31.

1877-81 The price of silver fell and caused many Nevada mines to close.

1880-90 Unemployed people left Nevada and the population dropped by almost 15,000.

1909 The Nevada legislature passed laws that made gambling illegal. The laws went into effect in 1910.

1931 The legislature reduced the divorce residence requirement to six weeks and also made gambling legal in the state.

1936 Boulder (now Hoover) Dam was completed.

1951 The Atomic Energy Commission began testing nuclear weapons in southern Nevada.

1963 The Supreme Court of the United States settled a 40-year dispute by specifying how much water the states of Arizona, California, and Nevada could draw from the Colorado River.

1967 The Nevada legislature changed state gambling laws to allow corporations that sell stock to the public to buy casinos and to hold gambling licenses.

1971 The Water Project (now called the Robert B. Griffith Water Project) was completed.

1980 The Nevada legislature passed conservation laws to protect Lake Tahoe from pollution.

constitution won the approval of the voters. The people elected Republican Henry G. Blasdel, a mining engineer, their first governor. President Lincoln proclaimed Nevada a state on Oct. 31, 1864.

Mine failure and recovery. In the 1870's, mining companies dug the richest silver ore from Nevada's mines. Some of the state's mines produced only "low-grade" ores that contained small amounts of silver. Mine owners made a profit on these ores because silver had a high value.

During the early 1870's, the U.S. government limited the use of silver in its money system. As the government's demand for silver fell, the value of silver also dropped. As a result, many mines closed because they could no longer produce low-grade ores at a profit, and many people lost their jobs. Unemployed people began to leave Nevada by the thousands to find work elsewhere. The state's population dropped from 62,266 in 1880 to 47,355 in 1890. Several thriving communities became ghost towns.

As mining failed, ranching grew in importance. However, the ranchers also faced difficult problems. They had to pay the railroad extremely high rates to ship their stock. In addition, severe winters in the late 1880's killed thousands of cattle. Many owners of small herds became bankrupt and had to sell out to operators of large ranches.

Economic recovery began with new mineral discoveries in 1900. Prospectors found huge deposits of silver at Tonopah. They could be mined profitably, although silver still had a low value. Prospectors uncovered copper ores at Ruth and Kimberly, near Ely. In 1902, gold was discovered at Goldfield. Rich deposits discovered the next year brought thousands of miners back to Nevada.

As the mining industry came to life again, the railroads built branch lines to the mining areas. Trains brought equipment to the mines and hauled ore away to processing plants. Cattle owners also used the new branch lines for speedy beef shipments.

Nevada's Newlands Irrigation Project, the country's first federal irrigation project, was completed in 1907. In this project, dams along the Carson and Truckee rivers create irrigation reservoirs and generate electricity. Water from this system supplies an agricultural region that developed near Fallon, which is located in the west-central part of Nevada.

The richest of Nevada's gold and silver deposits were running out when the United States entered World War I in 1917. Industries then began to demand copper, tungsten, zinc, and other metals for weapons and wartime supplies. Many new mines opened in Nevada, and mine owners collected top prices for the metals. But prices fell after the war ended in 1918, and many mines closed.

In 1928, Congress authorized the construction of Hoover Dam on the Colorado River. Work on the dam began in 1930. The huge project was completed in 1936. Hoover Dam provides power and stores up irrigation water for parts of Nevada, Arizona, and California.

Legal gambling and easy divorce. As early as 1869, Nevada's legislature had permitted gamblers to operate games of chance in the state. By 1910, various groups of citizens had succeeded in having laws passed against gambling. But gamblers continued to operate illegally, and enforcement of the gambling laws was costly. Finally, the legislature decided it would be better to legalize gambling than to spend money trying to stop it. In 1931, Nevada made gambling legal. Many gambling casinos began to operate in the state in the 1930's.

In the early 1900's, Nevada had passed laws that made it easy to get a divorce. A person had to live in Nevada for only six months to get a divorce there. In 1927, the Nevada legislature passed a law allowing persons to obtain a divorce if they lived in the state for only three months. In 1931, the period was reduced to six weeks. During the mid-1900's, thousands of people went to Nevada each year to get divorces quickly and easily.

The mid-1900's. World War II (1939-1945) created new business for Nevada's mining industry. Manufacturers of military supplies purchased large amounts of the state's copper, lead, magnesite, manganese, tungsten, and zinc. After the war, mining decreased. The industry gradually switched to the production of gypsum, lime, and other nonmetallic minerals.

In the late 1940's, Nevada began a widespread campaign to attract new industry. Although the campaign brought a number of factories into the state, Nevada's economy during the 1950's and 1960's depended chiefly on nuclear research and tourism.

In 1950, the Atomic Energy Commission (AEC) set up a testing center about 60 miles (97 kilometers) northwest of Las Vegas. The next year, the AEC began testing nuclear weapons. In 1962, it began a program to develop peaceful uses of nuclear energy.

Tourism remained Nevada's largest and fastest-growing industry during the 1950's and 1960's. By the late 1960's, the Las Vegas area alone attracted annually about 15 million tourists, who spent about $400 million. Tourists also flocked to the state's two other main resort centers, Reno and the Lake Tahoe area.

In the late 1950's, the Nevada legislature set up strict gambling regulations to prevent cheating and to stop criminals from entering or influencing the gambling industry. The regulations require every gambling house to have a state license, which is issued only after investigation by the Gaming Control Board and final approval by the Gaming Commission. In 1967, the legislature passed a law allowing corporations that sell stock to the public to hold gambling licenses. The new law was a further attempt to keep the underworld out of the gambling industry.

In 1963, the Supreme Court of the United States settled a 40-year dispute between Arizona, California, and Nevada over water supplies from the Colorado River. The court ruled on how much water each state could draw from the river every year.

In 1966, Howard Hughes, an American businessman and one of the world's richest people, moved to Las Vegas. He then bought airports, casinos and hotels, large tracts of land, and a television station in the area.

In 1967, the Water Project (now called the Robert B. Griffith Water Project) was created to provide increased water supplies for the expected growth in the Las Vegas area. The final stage of the project, which brings water from Lake Mead, was completed in 1983.

The late 1900's. In the late 1970's, Las Vegas and Reno began projects to improve their airport facilities to accommodate a continuing increase in the number of

tourists. Reno's project was completed in 1981. Expansion of the McCarran International Airport in Las Vegas was completed in 1998.

Air and water pollution became serious problems in Nevada in the late 1900's. In one program to control water pollution, Nevada joined with California in the Tahoe Regional Planning Compact in 1980 to fight pollution of Lake Tahoe. By the 1990's, the compact had resulted in environmental improvements in the area.

Recent developments. Tourism remains Nevada's largest industry, but the manufacturing and construction industries are growing rapidly. The increase in tourism and the relocation of manufacturing facilities to the Las Vegas and Reno metropolitan areas have contributed to the growth of those areas. More than four-fifths of Nevada's people now live in the Las Vegas and Reno metropolitan areas.

Nevada cities face major problems as their populations continue to increase. Many of these problems require help from the state government. City dwellers are demanding better police and fire protection, improvements in education, better recreational facilities, and other services. In addition, African Americans and Indians in Nevada have made demands for equal job opportunities and rights.

Nevada, University of, is the state-supported public education system of higher education for Nevada. Its official name is the University of Nevada System. The system operates universities at Reno and Las Vegas, four two-year community colleges, and the Desert Research Institute.

Both the University of Nevada, Reno, and the University of Nevada, Las Vegas, grant bachelor's, master's, and doctor's degrees. The community colleges are Truckee Meadows Community College in Reno; Community College of Southern Nevada in North Las Vegas, Henderson, and Las Vegas; Northern Nevada Community College in Elko; and Western Nevada Community College in Carson City and Fallon.

The Desert Research Institute studies atmospheric and water resources as well as other environmental concerns of desert areas. The institute has facilities located in Boulder City, Las Vegas, and Reno.

The university was chartered in 1864 and began operation in Elko in 1874. The university moved to Reno in 1886.

Critically reviewed by the University of Nevada System

Nevelson, *NEHV uhl suhn,* **Louise** (1900-1988), was an American sculptor. She became best known for her *assemblages,* often grouped within boxlike frames. Many of the large black walls of her compartments express a feeling of quiet and majesty.

Most of Nevelson's assemblages are made out of wood that is painted either black or gold or left in the natural color. She was a pioneer in the creation of "total environments" of everyday "found" objects and utensils, strips of molding, woodwork decorations, or Victorian debris that form powerful unified wholes.

Nevelson was born in Kiev, Ukraine (then a part of the Russian Empire). She came to the United States in 1905. She studied painting at the Art Students League in New York City. George Gurney

A wooden sculpture painted black (1958); collection of the Norton Gallery of Art, West Palm Beach, Fla. Gift of Mr. and Mrs. Joseph Rosenberg (Pace Gallery)

Louise Nevelson's *Sky Cathedral* is typical of the complex and mysterious wooden constructions that have made her famous.

Nevins, *NEHV ihnz,* **Allan** (1890-1971), an American historian and educator, twice was awarded the Pulitzer Prize for biography. *Grover Cleveland: A Study in Courage* won the prize in 1933, and *Hamilton Fish: The Inner History of the Grant Administration* received the award in 1937. He won the Bancroft Prize and the Scribner Centenary Prize for *The Ordeal of the Union* (1947). Nevins's works are noted for being well balanced and thorough, with a distinctive literary style.

His *John D. Rockefeller,* a biography published in 1940, became very popular. It was revised and republished in 1953 as *Study in Power: John D. Rockefeller, Industrialist and Philanthropist.* Nevins and Frank Ernest Hill completed *Ford: The Times, the Man, the Company,* a study of Henry Ford, in 1954.

In addition to his histories and biographies, Nevins also edited collections of the letters of noted historical people. He completed his first book, *Life of Robert Rogers,* in 1914, and followed it with more than 50 other volumes. His other books include *The American States During and After the Revolution* (1924), *Frémont: The West's Greatest Adventurer* (1927), *A Brief History of the United States* (1942), *The Emergence of Lincoln* (1950), and *Herbert H. Lehman and His Era* (1963).

Born in Camp Point, Illinois, Nevins graduated from the University of Illinois. He wrote editorials for the *New York Evening Post* from 1913 to 1923 and wrote for the magazine *The Nation* from 1913 to 1918. Nevins joined the staff of the *New York Sun* in 1924, and *The* (New York) *World* in 1925. He was a professor of history at Cornell University in 1927 and 1928, and at Columbia University from 1931 to 1958. In 1958, he became a senior fellow of research at the Henry E. Huntington Library in San Marino, California. Nevins lectured on American history at several universities in other nations. He served as a special representative for the Office of War Information in Australia and New Zealand in 1943 and 1944, during World War II. Robert C. Sims

New Age movement is a popular cultural movement that began in the early 1970's. The movement calls for keeping the body, mind, and spirit in harmony. Its followers believe in intuition and direct experience rather than science and rational thought.

The New Age movement takes a strong interest in personal development. Followers often rely on spiritual means to achieve self-help. Mystical Asian religions play a major role in the movement's spiritual life, especially such faiths as Zen Buddhism and the yoga school of Hinduism. New Age also emphasizes the *occult* (magic) and caring for the environment. Many followers believe in the coming of an astrological age of peace and love.

Healing both the body and mind is central to the movement. New Age supports a *holistic* approach to health, which is based on the interrelationship of many factors, including family relationships and working conditions. Many New Agers seek alternative health care, such as acupuncture and remedies made from herbs, rather than traditional medical treatments.

New Age music attempts to encourage spiritual well-being and inner peace through relaxation and meditation. New Age music typically is instrumental music that features such soothing instruments as the bamboo flute,

chimes, and tuned crystals. Richard Kyle

New Amsterdam. See **New York City** (History).

New Bedford (pop. 93,768; met. area pop. 175,198) is one of the leading commercial fishing ports of the United States. It is located in southeastern Massachusetts. The city lies where the Acushnet River empties into Buzzards Bay, about 50 miles (80 kilometers) south of Boston. For location, see **Massachusetts** (political map).

New Bedford's chief industry is the production of seafood. The city's annual fish catch has a higher value than that of any other city in the United States. The city's fishing fleet is one of the leaders in the world in catching flounders and sea scallops. Other major industries produce electric equipment, rubber goods, and textiles. The city also is a trade and distribution center of southeastern Massachusetts. It has an expanding tourist industry.

Through the years, large numbers of Portuguese immigrants have settled in New Bedford. The Feast of the Blessed Sacrament, a four-day Portuguese festival, attracts more than 100,000 visitors in August.

Wampanoag Indians lived in what is now the New Bedford area before white settlers arrived there. In 1652, a group of Pilgrims bought land from Massasoit, the Wampanoag chief, and founded a settlement. The settlement later was named for the Duke of Bedford.

New Bedford developed slowly until the 1760's, when the colonists established a whaling industry. By the mid-1800's, New Bedford had become the whaling capital of the world. The Wamsutta Mills, the city's first major textile plant, opened in 1846. New Bedford received a city charter in 1847.

New Bedford's whaling industry declined rapidly during the late 1800's, chiefly because petroleum products replaced whale oil for many purposes. Exhibits of the whaling era are featured by the New Bedford Whaling Museum in downtown New Bedford. A textile boom during the 1880's made the city a leading producer of cotton fabrics.

During the middle and late 1900's, New Bedford began several construction projects. A dike that protects the city's harbor from hurricanes was completed in 1966. In 1996, New Bedford Whaling National Historical Park was created to commemorate New Bedford's whaling industry of the 1800's. New Bedford has a mayor-council form of government. Laurence A. Lewis

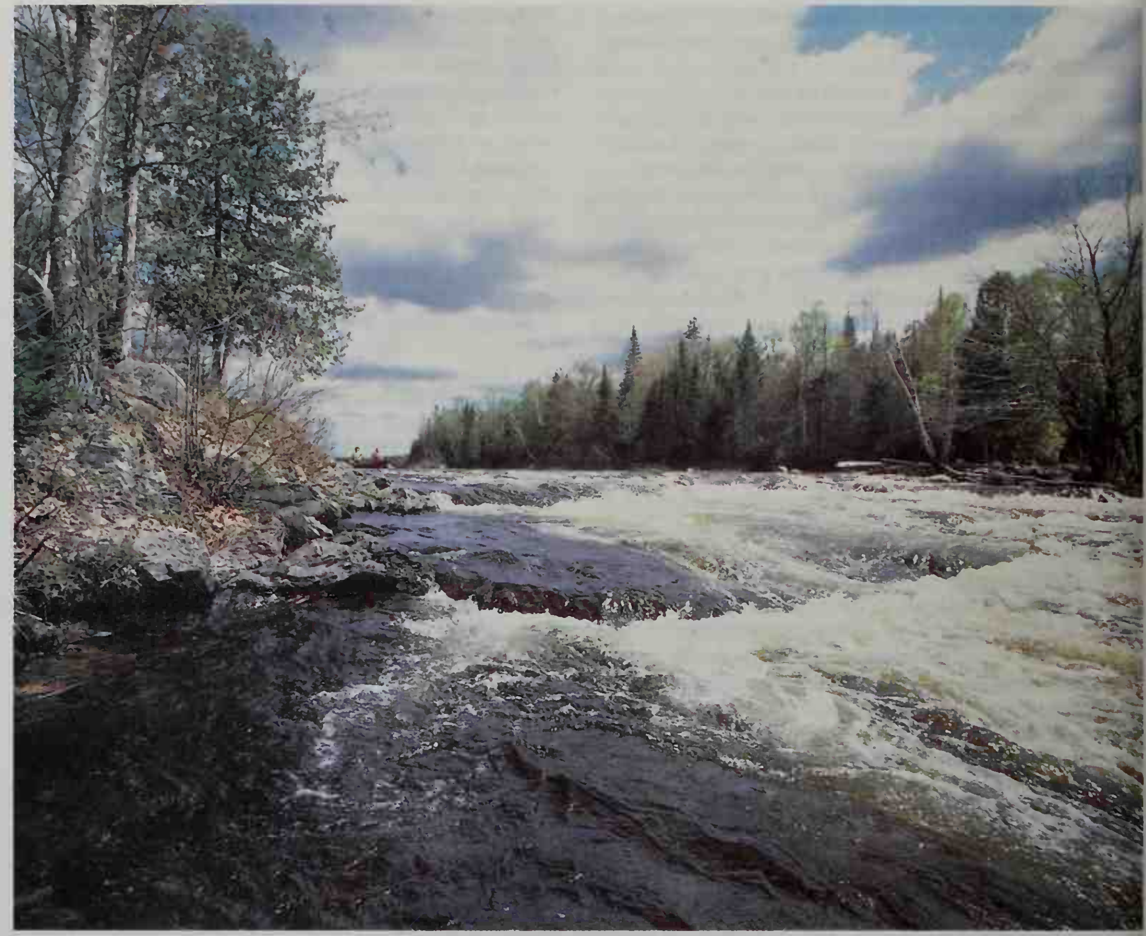
New Bern (pop. 23,128) is North Carolina's second oldest town, after Bath. It lies at the junction of the Trent and Neuse rivers, about 35 miles (56 kilometers) from the Atlantic Ocean (see **North Carolina** [political map]). In 1766, New Bern became the capital of the North Carolina colony and a major port. It remained the capital until 1778. The coming of the railroads in the mid-1800's contributed to the lessening of its importance as a port.

New Bern was founded in 1710 by Baron Christoph von Graffenried of Switzerland and German Palatines, who were seeking religious freedom. A colonial capitol and governor's residence called Tryon's Palace was completed in 1770. The building was restored in the 1950's and is now a tourist attraction. New Bern, named for Bern, Switzerland, is the seat of Craven County. It has a council-manager government. Jerry L. Surratt

New Britain is the largest of the more than 300 islands in the Bismarck Archipelago, which forms part of the nation of Papua New Guinea. New Britain lies off the northeast coast of New Guinea. It covers 14,093 square miles (36,500 square kilometers). Mountain ranges run the length of the island.

About 312,000 people live on New Britain. Almost all are Melanesians. The people fish and farm for a living. Most of the farming is done along the coasts. The island's north end is the most fertile area in Papua New Guinea. Rabaul is the island's largest urban community and port. It lies along the coast and has several active volcanoes around it. Rabaul suffered much damage in 1937 and 1994 when volcanoes erupted.

In 1700, the English navigator William Dampier reached New Britain. In 1884, it became a part of a German empire. Australian forces took the island from Germany in 1914, during World War I. It was given to Australia as a mandate of the League of Nations in 1920. Japan captured Rabaul in 1942, during World War II, and held the area until 1945. During the war, bombing raids destroyed most of Rabaul, but the city was rebuilt. Australia regained control of the area after the war. In 1975, New Britain became part of the newly independent nation of Papua New Guinea. David A. M. Lea



See also **Bismarck Archipelago; Papua New Guinea** (map).

New Britain, Connecticut (pop. 71,538), often called the *Hardware City,* has long been a producer of builders' hardware and carpenters' tools. New Britain lies in central Connecticut, about 10 miles (16 kilometers) southwest of Hartford (see **Connecticut** [political map]). Today, many factories in New Britain still produce small hardware items. Some factories make technological goods, such as computer components.

The New Britain Museum of American Art is known for its extensive collection of American paintings. Central Connecticut State University, founded in 1849, is in the city. It includes the Copernican Planetarium and the Space Science Center. New Britain was settled in 1687 and became a city in 1870. It has a mayor-council government. Bart Fisher

New Brunswick, New Jersey (pop. 48,573), is an educational and industrial center. It lies on the Raritan River in the north-central part of the state (see **New Jersey** [political map]). The city produces clothing, machinery, medical supplies, and pharmaceuticals. New Brunswick is the chief city in the metropolitan area (pop. 1,169,641) made up of Middlesex, Somerset, and Hunterdon counties. In World War II (1939-1945), nearby Camp Kilmer processed thousands of soldiers sent to Europe.

New Brunswick is the home of Rutgers, the State University of New Jersey; the New Brunswick Theological Seminary; and the State Agricultural Experiment Station. The town became a transportation center early in its history. The Raritan River was part of the land-water route from New York City to Philadelphia. New Brunswick was chartered in 1730. In the late 1900's, the city completed a number of projects in the downtown area. The new construction included office buildings, a hotel and conference center, a cultural center, shopping facilities, and an automobile bridge over the Raritan River. New Brunswick has a mayor-council form of government. It is the seat of Middlesex County. Robert M. Hordon

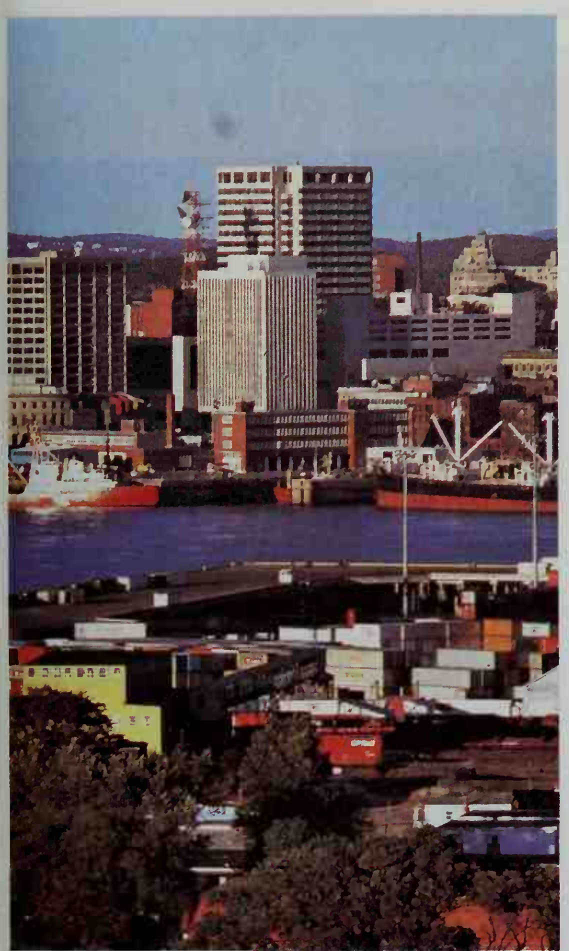
The Little Falls of the St. Croix River on the border with Maine

New Brunswick

New Brunswick is one of the four Atlantic Provinces of Canada. Clear, swift rivers rush down the many hills and sweep through the steep valleys of New Brunswick. Forests cover about 90 percent of the land and add to its natural beauty. Saint John is New Brunswick's largest city and chief industrial and shipping center. Fredericton is the capital. Moncton is a distribution center.

Every year, loggers cut millions of trees from New Brunswick's thick forests. Many trees are sawed into lumber. Even more go to pulp and paper mills, where they are processed into a soft mass called pulp and made into paper. Newsprint, the paper used in printing newspapers, is a leading manufactured product.



The province has rich mineral and energy resources that give it great potential for industrial growth. Huge deposits of copper, lead, silver, and zinc lie in northeastern New Brunswick. In the 1950's, geologists mapped the area, and in the 1960's new facilities were built to develop the area's resources. In the 1980's, large potash mines opened in southern New Brunswick. A nuclear power plant began operating in 1982. In addition, the province has the largest oil refinery in Canada, in Saint John.

New Brunswick has some moderately rich farmland in the St. John River Valley and other regions. Potatoes rank as New Brunswick's leading field crop. The province has one of the world's largest frozen food industries. Dairy farming is extensive. Lobsters and crabs are the most important seafood catches. Fishing fleets on the Bay of Fundy and the Gulf of St. Lawrence make large hauls of herring and shrimp. The rivers and rolling woodlands of New Brunswick are among the best fishing and hunting grounds in North America.

In 1922, Andrew Bonar Law of New Brunswick became the only person born outside the British Isles to serve as prime minister of the United Kingdom. Richard B. Bennett, another New Brunswicker, became prime

The Port of Saint John

Interesting facts about New Brunswick

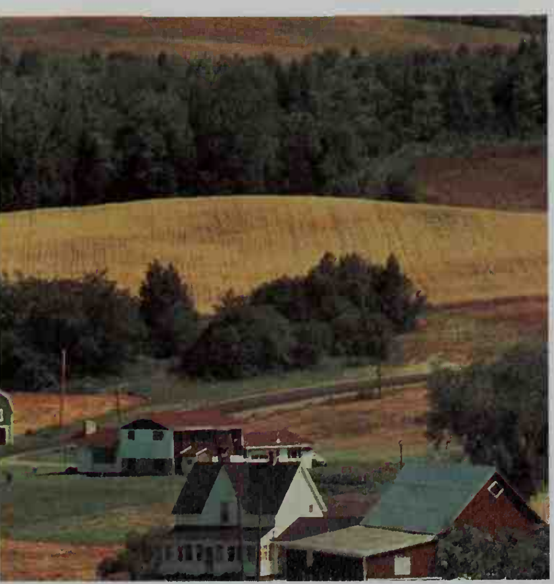
WORLD BOOK illustrations by Kevin Chadwick

Middle Island and Chatham Lake, located about 1 mile (1.6 kilometers) from each other near Chatham, are exactly the same size and shape. The Micmac Indians of eastern Canada had many legends about an Indian folk hero called Glooscap, who supposedly shaped much of their landscape. According to a Micmac legend, Glooscap once became so enraged that he scooped out a handful of earth, forming Chatham Lake, and flung it into the Miramichi River, forming Middle Island.

Middle Island and Chatham Lake

The *Marco Polo,* a clipper ship built in 1851 in Saint John, earned the reputation as the fastest ship in the world. The ship sailed at record speed from England to Australia and back in 1852. The *Marco Polo* made the round trip in just under six months.

The *Marco Polo*



The Bay of Fundy has the world's highest tides. They sometimes are more than 50 feet (15 meters) high in the northern part of the bay, far surpassing the world average of $2\frac{1}{2}$ feet (0.8 meter).

Julia Catherine Beckwith Hart wrote *St. Ursula's Convent: Or, The Nun of Canada,* the first novel published in what later became Canada. The book was published in 1824.

minister of Canada in 1930. Other well-known New Brunswickers include Bliss Carman, perhaps Canada's most famous poet; and Sir Charles Roberts, a poet, novelist, and short-story writer.

New Brunswick was named for the British royal family of Brunswick-Lüneburg (the House of Hanover). Most of its early settlers were American colonists who had remained loyal to England during the American Revolutionary War. About 14,000 of these Loyalists, as they were called, arrived during and after the war, most of them in 1783. They settled among a few thousand French-speaking Acadians and several hundred Micmac and Maliseet, or Malecite, Indians. As a result of these Loyalist settlers, New Brunswick received the nickname of the *Loyalist Province.* It is also called the *Picture Province* because of its natural beauty.

New Brunswick, along with Nova Scotia, Ontario, and Quebec, was one of the original provinces of Canada. For the relationship of New Brunswick to the other provinces, see **Canada; Canada, Government of; Canada, History of.**

Rolling hills around the village of Millville

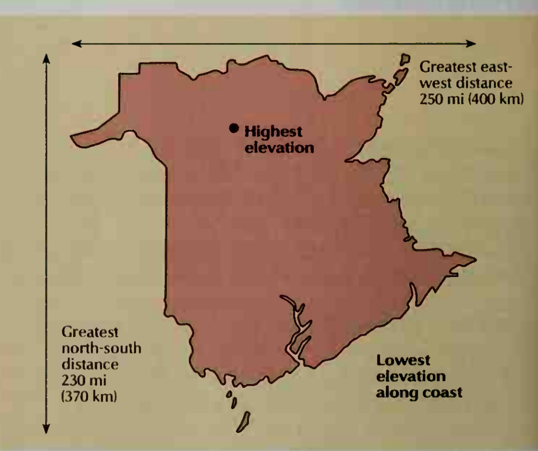
New Brunswick in brief

Symbols of New Brunswick

The provincial flag, adopted in 1965, is based on the provincial coat of arms. The coat of arms, adopted in 1868, has a shield with a British lion symbolizing New Brunswick's ties to the United Kingdom. The galley represents shipbuilding and seafaring, both important in the province's history. A crest and supporters were added in 1984. The crest is a salmon bearing St. Edward's crown. Two white-tailed deer support the shield.

Provincial flag

New Brunswick (brown) is eighth in size among the provinces and second among the Atlantic Provinces (yellow).



The Legislative Building is in Fredericton, New Brunswick's capital since 1785. Some legislative sessions before 1788 were held in Saint John (then called Parrtown).

General information

Entered the Dominion: July 1, 1867; one of the original four provinces.
Provincial abbreviation: NB (postal).
Provincial motto: *Spem Reduxit* (Hope Restored).

Land and climate

Area: 28,355 mi² (73,440 km²), including 520 mi² (1,350 km²) of inland water.
Elevation: *Highest*—Mount Carleton, 2,690 ft (820 m) above sea level. *Lowest*—sea level along the Atlantic coast.
Coastline: 1,410 mi (2,269 km).
Record high temperature: 103 °F (39 °C) at Nepisiguit Falls and at Woodstock on Aug. 18, 1935, and at Rexton on Aug. 19, 1935.
Record low temperature: −53 °F (−47 °C) at Sisson Dam on Feb. 1, 1955.
Average July temperature: 64 °F (18 °C).
Average January temperature: 14 °F (−10 °C).
Average yearly precipitation: 45 in (115 cm).

Important dates

1534 — Jacques Cartier, a French explorer, arrived in Chaleur Bay.

1604 — Samuel de Champlain and Sieur de Monts spent the winter on St. Croix Island.

1784 — New Brunswick became a separate province.

1842 — The New Brunswick-Main[e] boundary dispute was sett[led]

Sources of information

For information on tourism in New Brunswick and on the province's economy, write to: New Brunswick Department of Economic Development, Tourism and Culture, P.O. Box 6000, Fredericton, NB E3B 5H1. The department's Web site at www.gov.nb.ca/edt is also a helpful resource. For information on the government of New Brunswick, write to: Communications New Brunswick, P.O. Box 6000, Fredericton, NB E3B 5H1. Communications New Brunswick's Web site at www.gov.nb.ca/cnb also has useful information. For information on New Brunswick's history, write to: Legislative Library, Province of New Brunswick, P.O. Box 6000, Fredericton, NB E3B 5H1.

1867 New Brunswick became one of the original four provinces of the Dominion of Canada.

1890 Two national railway systems linked New Brunswick cities with Montreal.

1952-1953 Large deposits of copper, lead, silver, and zinc were mapped in the Bathurst-Newcastle region.

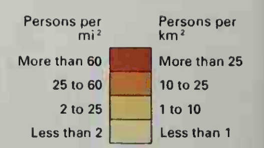
1997 Confederation Bridge, which connects New Brunswick and Prince Edward Island, opened.

People

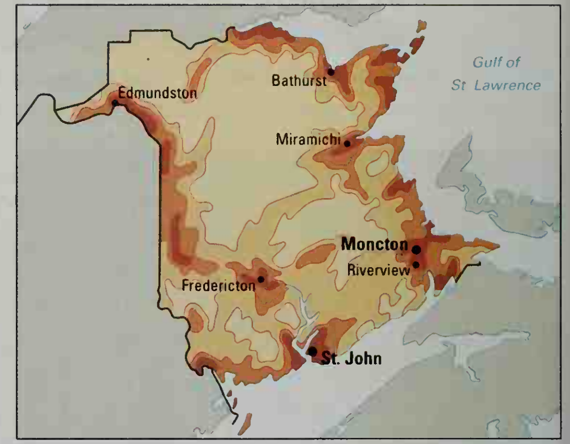
Population. The 2001 Canadian census reported that New Brunswick had 729,498 people. The province's population had decreased by about 1 percent since the 1996 census, which reported a population of 738,133.

About half the people of New Brunswick live in cities and towns. About a sixth of the people live in the metropolitan area of Saint John. Saint John has the province's only Census Metropolitan Area as defined by Statistics Canada.

Two other cities in New Brunswick have populations of more than 40,000. They are Moncton and Fredericton. The province has only a few other cities and towns with populations of more than 10,000.



About 96 of every 100 New Brunswickers were born in Canada. Most of the others came from the United States or the United Kingdom.



New Brunswick has two official languages, English and French. It is the only legally bilingual province in Canada. About two-thirds of the people speak English as their native language. They include descendants of the Loyalists who left the American Colonies in the 1700's. Other English speakers include descendants of English, Irish, and Scottish immigrants who arrived in the 1800's. About one-third of New Brunswick's people, called Acadians, speak French as their native language. The south and west of the province is mostly English-speaking. The Acadians are concentrated in the north and east. About 30 percent of New Brunswickers speak both languages. About 9,000 people in New Brunswick have some American Indian ancestry.

Schools. During the late 1700's, most schooling in the New Brunswick region took place in the home—or in

Population density

Most of New Brunswick's people live near the coast and in the southern part of the province. Large areas are thinly settled. Saint John is the largest city.

WORLD BOOK map; based on the *National Atlas of Canada*

Barrett & MacKay

King Square, in downtown Saint John, is one of several charming and restful parks in the city. About a sixth of New Brunswick's people live in the metropolitan area of Saint John.

Freeman Patterson, Canadian Government Office of Tourism

Maypole dancers perform at Mactaquac Provincial Park, which overlooks Mactaquac Dam near Fredericton. The park has beaches, a marina, camping grounds, and a golf course.

privately run schools. Most early schools were open only a few months of the year. Classes were often taught by traveling teachers. An act of 1805 established New Brunswick's first *grammar* (high) school at Saint John and provided for two schools for younger pupils in each remaining county. Some of these schools became grammar schools as populations grew. An act of 1816 created a system of public schools by granting funds for education to each county. Parents and church groups also supported many schools in New Brunswick in the 1800's. In 1871, the provincial government established a free public school system, supported by provincial grants and by county and local taxes. In 1967, the government took over all costs of public school education.

Elected district education councils administer public schools in New Brunswick. Each school also has an elected parent school support committee.

New Brunswick law requires children to attend school from age 7 to age 18 or until they graduate. A law was scheduled to go into effect in 1999 that would require children to attend school until age 18 or until they graduate. Education is available to all students in either English or French.

Libraries. New Brunswick has five regional library systems, with many local libraries. The provincial legislative library is in Fredericton. Other libraries include the Harriet Irving Library of the University of New Brunswick in Fredericton, the Ralph Pickard Bell Library of Mount Allison University in Sackville, and the Champlain Library of the University of Moncton.

Museums. The New Brunswick Museum in Saint John is Canada's oldest museum. It was founded as the Museum of Natural History in 1842. Today, the museum has fine cultural, historical, and scientific exhibits. The Central New Brunswick Woodmen's Museum in Boiestown has exhibits of pioneer life in the province. The Acadian Museum at the University of Moncton features material on Acadia, a region settled by the French in the 1600's that included what is now New Brunswick. The Atlantic Salmon Museum in Doaktown has exhibits dealing with the Atlantic salmon and salmon fishing. The York Sunbury Historical Museum in Fredericton depicts the history of central New Brunswick.

Universities

New Brunswick has four degree-granting universities that are members of the Association of Universities and Colleges of Canada.

André Gallant, New Brunswick Department of Economic Development and Tourism

Fredericton, the capital of New Brunswick, lies along the St. John River in the southwestern part of the province.

Visitor's guide

Thousands of people visit New Brunswick every year. These visitors enjoy boating and swimming off the beaches of the Northumberland Strait. In addition, the thick forests of New Brunswick offer excellent camping facilities.

New Brunswick offers some of the best fishing in North America. Fishing enthusiasts cast for fighting Atlantic salmon—the prize catch—and bass, trout, and tuna.

Many of New Brunswick's most popular attractions lie along the Bay of Fundy coastline. These attractions include Fundy National Park, Reversing Falls, and Flowerpot Rocks. The Bay of Fundy's tides are the highest in the world.

Malak

Kings Landing Historical Settlement in Prince William, near Fredericton

Places to visit

Following are brief descriptions of some of New Brunswick's many interesting places to visit:

Acadian Historical Village, near Caraquet, is a reconstructed Acadian settlement from 1780 to the early 1900's.

Aquarium and Marine Center, in Shippagan, displays about 80 forms of marine life from the Gulf of St. Lawrence.

Covered bridge, over the St. John River in Hartland, is 1,282 feet (391 meters) long. It is believed to be the longest covered bridge in the world. The province also has a number of other covered bridges.

Flowerpot Rocks, at Hopewell Cape in Albert County, rise in fantastic forms. These rocks are carved by tides from the Bay of Fundy.

Huntsman Marine Science Centre and Aquarium is in St. Andrews. It features films and specimens of local marine life, including lobsters, salmon, and seals.

Islands in the Bay of Fundy. Campobello, Deer, and Grand Manan islands have fine harbors for yachting and colorful fishing villages. President Franklin D. Roosevelt of the United States kept a summer home on Campobello Island. See Roosevelt Campobello International Park.

Kings Landing Historical Settlement, which is a re-created village in Prince William, shows how the Loyalist settlers in the region lived during the period from 1784 through 1890. The settlement includes a church, houses, an inn, various other businesses and shops of the period, and a reception center. It is composed mainly of original buildings that were brought from a flooded area in the province.

Loyalist House, in Saint John, was built between 1810 and 1817 by David Merritt, a Loyalist from the United States. It was restored and opened in 1960.

Magnetic Hill Complex is near Moncton. At this site, an optical illusion makes it seem as though automobiles can coast uphill. The complex also includes a zoo and a water park.

Miramichi Salmon Museum, in Doaktown, shows the life cycle of the salmon with live samples.

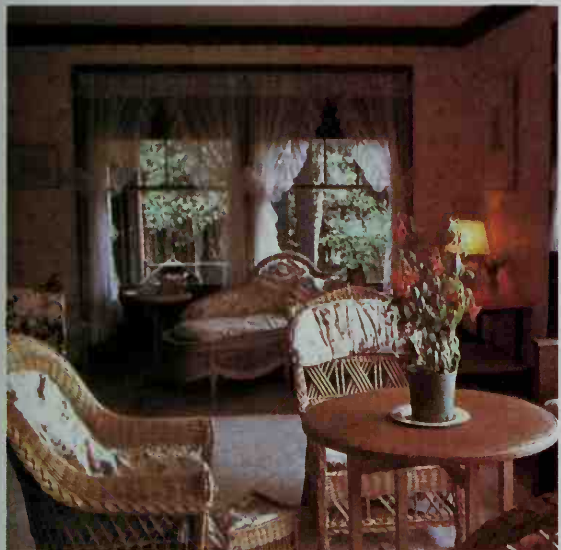
Reversing Falls are at the mouth of the St. John River in Saint John. Here, high tides from the Bay of Fundy force the river backwards through the falls two times a day.

National parks and sites. New Brunswick has two national parks—Fundy National Park and Kouchibouguac National Park. National historic parks and sites include Carleton Martello Tower, Fort Beauséjour, and St. Andrews Blockhouse. For the areas and chief features of these parks and sites, see **Canada** (National Park System).

Provincial parks. For information on them, write to New Brunswick Department of Tourism and Parks, Box 6000, Fredericton, NB E3B 5H1. The Web site at www.tourismnbcanada.com/web provides detailed information on the parks in New Brunswick.

The City of Saint John

Celebration of the Loyalists' landing in Saint John



Annual events

June-July

Canada's Irish Festival in Miramichi (July); Lobster Festival in Shediac (July); New Brunswick Highland Games and Scottish Festival in Fredericton (July); International Festival of Baroque Music in Lamèque (July-August).

August-September

Foire Brayonne in Edmundston (August); Atlantic Waterfowl Celebration in Sackville (August); Chocolate Fest in St. Stephen (August); Festival by the Sea in Saint John (August); Acadian Festival in Caraquet (August); Folk Song Festival in Miramichi (August); Mactaquac Craft Festival in Fredericton (September); Harvest Jazz and Blues Festival in Fredericton (September).

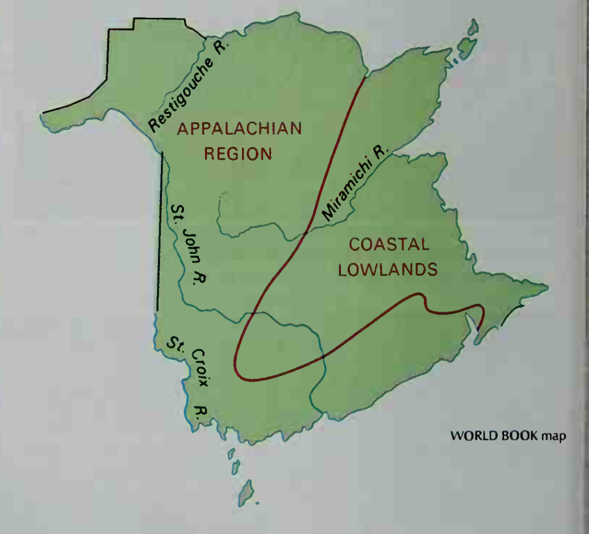
Land and climate

Land regions. New Brunswick is in the northeastern extension of the Appalachian mountain system of the eastern United States. This area is called the Appalachian Region. Most of it consists of wooded highlands with clear, swift rivers in steep valleys. The Coastal Lowlands, also part of the Appalachian Region, make up the rest of the province.

The highlands areas of the Appalachian Region consist of the Central Highlands, the Northern Upland, and the Southern Highlands. The Central Highlands are the highest section of New Brunswick. These rugged hills increase in height from the southwest to the northeast. Many rise over 2,000 feet (610 meters) above sea level. The hills include Mount Carleton, which stands 2,690 feet (820 meters) high. It is the highest point in New Brunswick. Northwest of the highlands is the flatter Northern Upland, with an elevation of about 1,000 feet (300 meters). The Southern Highlands, along the Bay of Fundy, have long ridges and valleys. Most of the hills are less than 1,000 feet (300 meters) high.

The Coastal Lowlands of the Appalachian Region are sometimes called the Eastern Plains. They slope gently down toward the east from the Central Highlands to the shores of the Gulf of St. Lawrence.

Coastline. New Brunswick has 1,410 miles (2,269 kilometers) of coastline. Deep bays and sharp inlets break



John de Visser, Masterfile

Flat, marshy land forms part of the Coastal Lowlands region of New Brunswick. The lowlands slope gently eastward from the Central Highlands of the Appalachian Region to the Gulf of St. Lawrence.

Bill Brooks, Masterfile

Mount Carleton is the highest point in New Brunswick. It rises 2,690 feet (820 meters) above sea level in the rugged Central Highlands of the Appalachian Region of the province.

WORLD BOOK map

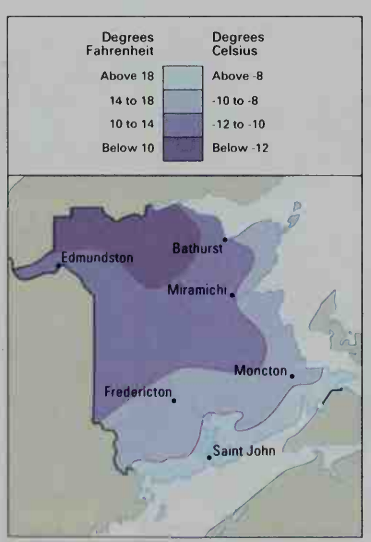
Barrett & MacKay, Masterfile

Grand Falls flows over a cliff on the St. John River at the town of Grand Falls. The river is the longest in New Brunswick.

Janet Foster, Masterfile

The rocks at Hopewell Cape on the Bay of Fundy are odd formations that have been carved out of the coast by strong tides.

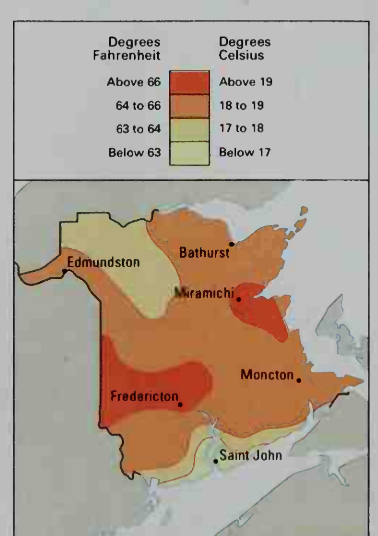
the coastline in many places. The Bay of Fundy is the largest bay. Its tides are the world's highest. The power of the tides generally keeps the bay's harbors free of ice in winter. But ice floes close ports on the Gulf of St. Lawrence. Other major bays include Chaleur, Chignecto, Miramichi, and Passamaquoddy.



Heavily wooded islands lie off the coast. Many of these coastal islands are summer resort areas. Numerous islands, many of which are only jagged rocks, lie in the Bay of Fundy. Grand Manan Island is the largest island in the bay. Miscou Island and Île Lamèque lie off the northeastern coast of the province.

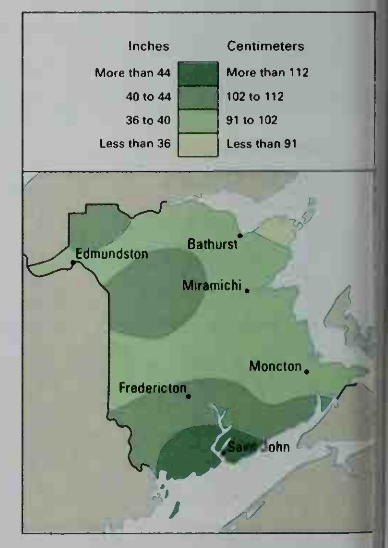
Rivers and lakes. The St. John River, the longest of the province's many rivers, flows 418 miles (673 kilometers). It rises in Maine, and drains western New Brunswick and the lower part of the Coastal Lowlands. Its many branches include the Nashwaak, Oromocto, and Tobique rivers. The St. Croix River forms part of New Brunswick's border with Maine. The Restigouche River forms part of the border between New Brunswick and Quebec. Other major rivers include the Nepisiguit, Petitcodiac, and Southwest Miramichi.

The great tides of the Bay of Fundy rush into the Petitcodiac River and other rivers in a wall of water called a



Average January temperatures

The coastal regions of New Brunswick are milder during wintertime than the inland sections to the northwest.



Average July temperatures

New Brunswick has mild summers with generally even temperatures throughout the province.

Average yearly precipitation

Precipitation in New Brunswick is heaviest along the southern coastal region and the lightest in the northeastern area.

bore. This bore flows as far inland as Moncton, 20 miles (32 kilometers) away. The Moncton bore rises to about 24 inches (61 centimeters). The Bay of Fundy's tides also produce the Reversing Falls at the mouth of the St. John River. At low tide, the river forms a falls as it rushes to the sea through a gap between high, rocky walls. When the tide comes in, however, it overpowers the river water and creates a falls in the opposite direction. At the town of Grand Falls, the St. John River plunges 75 feet (23 meters) over a cliff.

Grand Lake, the largest lake in New Brunswick, forms an arm of the St. John River. Other large lakes include Magaguadavic, Oromocto, Washademoak, and the Chiputneticook chain of lakes.

Plant and animal life. Forests cover about 85 percent of the land area of New Brunswick—a higher percentage than in any other province. Almost unbroken forest covers the central and northern areas. Most of the trees are evergreens. The principal varieties of trees in New Brunswick include spruce, balsam fir, pine, maple, and birch.

Purple violets and pink and white mayflowers carpet the forests late in spring. In summer, blackberries, blueberries, raspberries, and strawberries are plentiful. Fiddlehead ferns flourish along riverbanks.

New Brunswick offers outstanding hunting and fishing. Forest animals include beavers, black bears, deer, moose, rabbits, skunks, and squirrels. Game birds include ducks, geese, partridges, pheasants, and woodcocks. Game fish include Atlantic silver salmon, bass, landlocked salmon (salmon in freshwater lakes), and trout.

Climate. New Brunswick's coastal regions have quick changes in temperature, but the seasonal differences are not so great as those inland. Saint John, on the coast, averages 18 °F (−8 °C) in January and 62 °F (17 °C) in July. Inland, Fredericton averages 14 °F (−10 °C) in January and 67 °F (19 °C) in July. The record low, −53 °F (−47 °C), was set at Sisson Dam on Feb. 1, 1955. The record high was 103 °F (39 °C) in Nepisiguit Falls and Woodstock on Aug. 18, 1935, and in Rexton on Aug. 19, 1935.

Northern New Brunswick's *precipitation* (rain, melted snow, and other forms of moisture) averages 43 inches (108 centimeters) a year. The southern part of the province receives 48 inches (122 centimeters) a year. Snowfall in New Brunswick averages about 124 inches (314 centimeters) a year.

Economy

In the early days, the economy of the New Brunswick region was based chiefly on the timber trade and fishing. Agriculture and shipbuilding became important during the 1800's. Today, service industries make up the largest part of New Brunswick's *gross domestic product* (GDP)—the total value of all goods and services produced in a province in a year.

Natural resources. The forests and wildlife of New Brunswick are important natural resources. Wilderness covers much of the land, and rugged terrain interfered with the early development of the province's minerals and other resources.

Minerals. The northeastern part of New Brunswick has large reserves of metallic minerals. These deposits include copper, lead, silver, and zinc. The southeastern part of the province has a major potash deposit. Bituminous coal deposits lie just north of Grand Lake. New Brunswick also has reserves of clay, gold, limestone, peat, and sand and gravel.

Soil is not very fertile in most of New Brunswick. Farmers must use lime and fertilizers to make this soil productive. The flood plains of some rivers have a varying depth of extremely fertile black soil. Marshes and peat bogs cover parts of the east coast.

Service industries provide the largest portion of New Brunswick's gross domestic product. The leading service industry is made up of community, business,

Production and workers by economic activities

and personal services. This industry involves the operation of such establishments as hotels, hospitals, restaurants, and schools. Other service industries include finance, insurance, and real estate; wholesale and retail trade; transportation and communication; and government. Saint John and Moncton are the centers of trade and finance in New Brunswick. Fredericton, the provincial capital, is the center of government activities. Many of the province's service industries benefit from spending by tourists. Transportation and communication are discussed later in this section.

Manufacturing. Goods made in New Brunswick have a *value added by manufacture* of about 3 $\frac{1}{2}$ billion Canadian dollars yearly. This figure represents the difference between the value of raw materials and the value of the finished products made from the raw materials.

The manufacture of paper products is the leading manufacturing activity in New Brunswick. Major paper and pulp mills operate in Atholville, Bathurst, Dalhousie, Edmundston, Nackawic, Miramichi, and Saint John.

Food and beverage processing ranks second among New Brunswick's manufacturing activities. Frozen potatoes are the province's leading food product. Large plants in Florenceville and Grand Falls make frozen French fries. Other leading food and beverage products are baked goods, beer, dairy products, fish products, packaged meats, and soft drinks.

Wood products rank third. The province's wood products include lumber, doors, and window frames.

Economy of New Brunswick

WORLD BOOK map

John de Visser, Masterfile

A huge paper mill operates in Saint John. The production of paper products is an important manufacturing activity in New Brunswick.

Other important types of manufactured products made in New Brunswick include clay and cement products, fabricated metal products, petroleum products, printed materials, transportation equipment, and wood products. Structural metals for construction are the leading fabricated metal product. Facilities in Miramichi and Lamèque manufacture transportation equipment, and Saint John has a large shipyard.

Mining. Metals provide the largest portion of New Brunswick's mining income. Zinc is the leading metal, followed by silver and lead. Most metal mining occurs in the Bathurst area. Peat, used primarily as fertilizer, is harvested in the northeast. Coal is mined in the Minto-Chipman field near Grand Lake. Potash, which is used to make fertilizer, is mined in the Sussex area. Other mineral products from New Brunswick include antimony, bismuth, clay, copper, gold, limestone, peat, salt, sand and gravel, and sulfur.

Forestry. Most of the trees cut down in New Brunswick are balsam firs and spruces. Other commercially important trees include aspens, beeches, birches, cedars, maples, and pines. Most of the timber harvest is used to make paper. About half of New Brunswick's forestland is owned by the provincial government.

Fishing industry. Lobster and crab are New Brunswick's most important catches. The province's fishing crews also catch large amounts of herring, scallops, sea urchins, and shrimp. New Brunswick has a growing fish-farming industry, which produces salmon, trout, and

several other types of fish. Each year, the province exports about 300 million Canadian dollars' worth of seafood to Europe, Japan, and the United States.

Agriculture. New Brunswick has about 3,400 farms. They cover about 5 percent of the land. The best farmland lies in the valleys of the St. John River and its branches, and in the southeast.

Dairy products and potatoes are the leading farm products in New Brunswick. Each accounts for about a fifth of the annual farm income. River valleys provide excellent grazing for dairy cattle. Seed potatoes account for a significant part of the potato crop. Besides dairy cattle, livestock farmers also raise beef cattle, hogs, and poultry. New Brunswick has also become an important producer of nursery products and ornamental flowers. The province's farmers also produce a number of fruit and vegetable crops.

Electric power and utilities. About 30 percent of the electric power generated in New Brunswick is provided by a nuclear power plant at Point Lepreau, near Saint John. Plants that burn petroleum or coal provide about 35 percent of the electric power, and hydroelectric plants produce about 15 percent. New Brunswick purchases about 20 percent of its power from utilities in other provinces. The province exports electric power to Nova Scotia, Prince Edward Island, Quebec, and the Northeastern United States. Other utility companies in the province provide gas and water service.

Transportation. New Brunswick's busiest airports are in Fredericton, Moncton, and Saint John. Several national and regional airlines link these cities with cities in Canada and the United States.

Railroads connect the province to the major cities of Quebec and Ontario. New Brunswick's major highways run along the coastal areas and extend inward to Fredericton. The Trans-Canada Highway travels along the St. John River and through Moncton.

Saint John is one of the few seaports of eastern Canada that are free of ice all year. Transatlantic liners can dock at Saint John during the winter, even when ice shuts the ports on the Gulf of St. Lawrence.

Communication. The first newspaper in New Brunswick, *The Royal Gazette and the New Brunswick Advertiser,* was founded in 1785. Today, the province has about 25 newspapers. New Brunswick's daily papers include the *Telegraph Journal* of Saint John, the *Daily Gleaner* of Fredericton, and *The Times-Transcript* of Moncton. *L'Acadie Nouvelle* of Caraquet is a French language daily.

New Brunswick's first radio station, CFNB, began broadcasting in Fredericton in 1923. The province now has about 30 radio stations. The Canadian Broadcasting Corporation sends programs overseas from its shortwave transmitter in Sackville. New Brunswick's first television station, CHSJ-TV, began broadcasting in Saint John in 1954. The province has four major television stations, including one that broadcasts in French. Several other stations rebroadcast programming from two of the major stations. Cable television and Internet service is available throughout most of New Brunswick.

Government

Lieutenant governor of New Brunswick represents the British monarch, Queen Elizabeth II, in her role as the queen of Canada. The lieutenant governor is appointed by the governor general in council—that is, the governor general of Canada acting with the advice and consent of the Cabinet. The position of lieutenant governor is largely honorary.

Premier of New Brunswick is the actual head of the provincial government. The province, like the other provinces and Canada itself, has a *parliamentary* form of government. The premier of the province is an elected member of the Legislative Assembly. The premier is usually the leader of the majority party in the Legislative Assembly.

The premier presides over the Executive Council (cabinet). The premier chooses the Executive Council from among the members of the majority party in the Legislative Assembly. Each council member, called a minister, usually directs one or more departments of the provincial government. The Executive Council, like the premier, must resign if it loses the support of a majority of the Legislative Assembly.

Legislative Assembly of New Brunswick is a one-house legislature that makes the provincial laws. The Legislative Assembly is made up of 55 members who are elected from throughout the province. Terms served by the members of the Assembly may last up to five years. However, the lieutenant governor, on the advice of the premier, may call for an election before the end of the five-year period.

Courts. The highest court in New Brunswick is the Court of Appeal. It has a chief justice and five other justices. A panel of three judges hears most appeals, but some cases are argued before all six judges.

The Court of Queen's Bench has a chief justice and 21 other judges. The court has two divisions: the Trial Division and the Family Division. The Trial Division hears civil and criminal cases. The Family Division hears cases related to family matters, including divorce.

The governor general in council appoints judges of the Court of Appeal and Court of Queen's Bench. These judges may retire at age 65 or serve until age 75.

The Provincial Court has a chief judge and 25 other judges, all appointed by the provincial government. The court hears criminal matters, including cases involving juveniles. Lawyers may appeal Provincial Court verdicts to the Court of Queen's Bench or, in some cases, directly to the Court of Appeal.

Local government. The provincial government assesses and collects local taxes and administers all matters relating to education, health, welfare, and justice. City, town, and village councils handle such things as fire and police protection and maintenance of streets, sewers, and water service.

All of the cities, towns, and villages in New Brunswick have mayors and councils elected to three-year terms. Some of the cities and towns in New Brunswick also have managers.

Revenue. New Brunswick gets about half of its *general revenue* (income) from taxes levied by the provincial

government. Most of this revenue comes from taxes on personal income, property, and gasoline sales. The province also receives revenue from national and provincial tax-sharing arrangements and federal assistance. Most other revenue comes from the sale of liquor, which is under government control, and from license and permit fees.

Politics. The major political parties in New Brunswick are the Liberal and the Progressive Conservative parties. The Progressive Conservative Party was formerly named the Conservative Party, and today its members are usually called Conservatives. In 1991, the new Confederation of Regions Party won more seats in the Legislative Assembly than any party except the Liberal Party, but the Confederation of Regions Party lost all of its seats in the 1995 elections.

History

Indian days. The first white settlers in what is now New Brunswick found Micmac and Maliseet, or Malecite, Indians living in the region. Both these tribes belonged to the Algonquian Indian family. The Micmac roamed the eastern part of the region, and the Maliseet lived in the St. John River Valley.

The Indians liked to camp downstream from waterfalls or near the farthest reaches of tidewater in rivers. These locations provided the best fishing for salmon and trout. On the coasts, the Indians gathered clams and oysters.

Exploration and settlement. In 1534, the French explorer Jacques Cartier arrived in Chaleur Bay. He wrote of the region: "The land along the south side of it is as fine and as good land, as arable and as full of beautiful fields and meadows, as any we have ever seen."

No further exploration took place until 1604. That year, the French explorers Samuel de Champlain and Pierre du Gua (or du Guast), Sieur de Monts, sailed into the Bay of Fundy. They explored the coast and spent the winter on St. Croix Island, near the mouth of the St. Croix River. In 1605, they moved across the Bay of Fundy to Port Royal, in what is now Nova Scotia. Later in the 1600's, French settlers arrived and established farms and fishing stations. The French called the region Acadia (see **Acadia**).

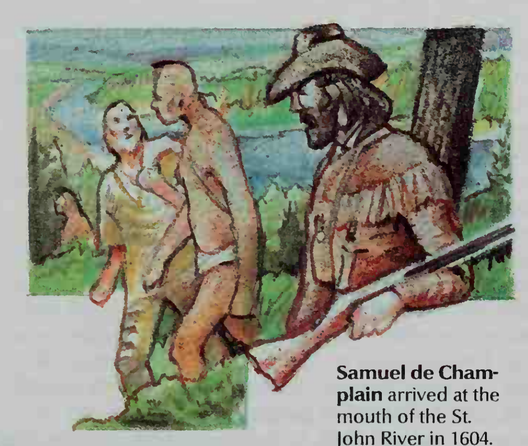
French rivals. The French, some of whom hoped to establish a fur trade, soon began to fight among themselves for control of the territory. The most famous struggle took place between Charles de la Tour and D'Aulnay de Charnisay. La Tour had a trading post and fort on the site of present-day Saint John. De Charnisay was a fur trader in Port Royal. In 1645, after many years of rivalry, De Charnisay attacked La Tour's fort while La Tour was absent. Marie de la Tour, the trader's wife, led the defense of the fort but finally surrendered. De Charnisay forced her to watch him hang all members of the garrison except one, who served as executioner.

Competition among the French gradually gave way to rivalry between the French and the English. To the south, the English colonies were growing rapidly. Many English fishing crews and other people were attracted to the New Brunswick region. The English conquered Acadia in 1654, but they returned it to the French in the Treaty of Breda in 1667. The English invaded Acadia again in 1690. After Queen Anne's War, France gave the mainland Nova Scotia area of Acadia to Britain in the Treaty of Utrecht (1713). Some Acadians remained in the New Brunswick region, however. During the last of the French and Indian wars, the British captured the region. They drove out many Acadians. The Treaty of Paris (1763) confirmed British ownership of the New Brunswick region of Acadia. See **French and Indian wars**.

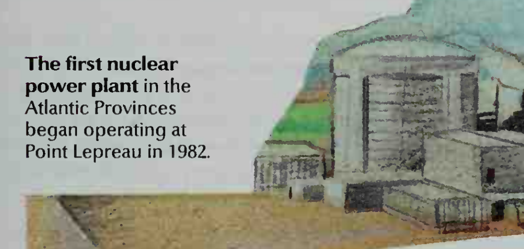
British settlement. Traders from New England arrived in Saint John in 1762. In 1763, other New Englanders set up the settlement of Maugerville, near what is now Fredericton. Also in 1763, the New Brunswick region became a part of the British province of Nova Scotia. Many Acadians whom the British had driven from the region were allowed to return. The Acadians received grants of lands located in the north and east.

During and after the American Revolutionary War, about 14,000 people loyal to Britain arrived from the United States, most of them in 1783. These Loyalists, as they were called, landed in Saint John. Most of them settled in the lower St. John River Valley. They founded

Historic New Brunswick



Fur traders fought for control of the New Brunswick region during the 1600's. The British won complete control in 1763.



Thousands of Americans loyal to England moved to New Brunswick during and after the Revolutionary War in America.

Samuel de Champlain arrived at the mouth of the St. John River in 1604.

The first nuclear power plant in the Atlantic Provinces began operating at Point Lepreau in 1982.

The Aroostook War was a dispute over the New Brunswick-Maine boundary. An 1839 truce prevented any fighting.

Important dates in New Brunswick

1534 The French explorer Jacques Cartier arrived in Chaleur Bay.

1604 Samuel de Champlain and Sieur de Monts of France spent the winter on St. Croix Island.

1762 Traders from New England arrived in Saint John.

1763 France, in the Treaty of Paris, confirmed British ownership of the New Brunswick region.

1770's-1780's Thousands of Loyalists came from the United States to settle in New Brunswick.

1784 New Brunswick became a separate province.

1825 A great fire swept the Miramichi River region.

1842 The New Brunswick-Maine boundary dispute was settled.

1848 New Brunswick was granted self-government.

1867 New Brunswick became one of the original four provinces of the Dominion of Canada.

1890 Two national railway systems linked New Brunswick cities with Montreal.

1952-1953 Vast deposits of copper, lead, silver, and zinc were mapped in the Bathurst-Newcastle region.

1968 An industrial development program was completed in the Bathurst-Newcastle region, and a hydroelectric plant opened at Mactaquac Dam on the St. John River near Fredericton.

1997 Confederation Bridge, which connects Prince Edward Island and New Brunswick, opened.

Fredericton. Others settled near Passamaquoddy Bay on the border with the United States. In 1784, Britain established New Brunswick as a separate province. In 1785, Saint John became the first incorporated city in what is now Canada. The following year, the Colonial Legislature was created, and the farmers and landowners elected the province's first Legislative Assembly.

The timber trade with the United Kingdom and shipbuilding grew during the 1800's. After 1815, thousands of English, Irish, and Scottish settlers came to New Brunswick because they could not find jobs in Britain.

In 1825, a great forest fire blazed through about 6,000 square miles (16,000 square kilometers) in the Miramichi River region. The fire, fanned by its own hurricanelike winds, wiped out entire settlements and killed about 150 people. The homeless settlers received clothing, money, and supplies from the other provinces, Great Britain, and the United States.

By the 1830's, about four-fifths of New Brunswick was still *crown lands* (lands held in the name of the British government). Timber traders had to pay fees to operate in the forests. In 1833, the provincial legislature began a movement to acquire the crown lands. The British government gave the lands to New Brunswick in 1837.

The Aroostook War. Settlers from New Brunswick and Maine lived in the valley of the Aroostook River. Britain and the United States had never agreed on a boundary in this region, and disputes developed between New Brunswick and Maine loggers. The climax came in 1839 when militias from New Brunswick and Maine assembled to fight. No fighting took place, however. President Martin Van Buren of the United States sent U.S. Army General Winfield Scott to settle the dispute, which was called the Aroostook War. Scott arranged a truce. In 1842, British and American authorities established the New Brunswick-Maine boundary.

As the population of New Brunswick grew, there were increasing demands for less political control by Britain. Political power shifted gradually from the British colonial office in London to the provincial legislature in Fredericton. In 1848, Britain granted New Brunswick almost complete control over its own affairs.

Confederation and progress. In 1864, delegates from New Brunswick, Nova Scotia, and Prince Edward Island met in Charlottetown, Prince Edward Island, to discuss forming a united colony. Delegates from Upper Canada and Lower Canada, the southern parts of what are now Ontario and Quebec, joined them and proposed a confederation of all the British provinces of eastern North America. The delegates met again later in 1864 in Quebec. They drew up a plan for Canadian confederation that led to the creation of the Dominion of Canada.

Many New Brunswickers feared they would lose their political powers in the proposed union. Samuel L. Tilley, a provincial political leader, played a major part in convincing the people that the larger provinces would not control them. On July 1, 1867, New Brunswick became one of the four original provinces of the Dominion of Canada. The others were Nova Scotia, Ontario, and Quebec. Andrew R. Wetmore, of the Confederation Party, became the first premier of New Brunswick after confederation. The most prominent premier in the years following confederation was George E. King, who passed the act establishing free public schools in 1871.

The province's fishing, lumbering, and mining industries expanded gradually. But the increasing use of iron steamships led to the end of New Brunswick's sailing-ship industry. It was replaced by important textile and iron industries. During the 1870's and 1880's, many New Brunswickers moved to western Canada and the United States. These regions offered better job opportunities.

By 1890, two national railway systems linked cities in New Brunswick with Montreal. Saint John ranked with Halifax, Nova Scotia, as a chief winter port on Canada's east coast. However, Ontario and Quebec controlled manufacturing and trade in Canada. After 1900, the pulp industry became increasingly important in New Brunswick. Public works programs improved communication and transportation in the province during the early 1900's. But New Brunswick's industries suffered serious decline between 1919 and 1925. Recovery came slowly. The major growth during the 1920's and 1930's occurred in the paper industry.

The mid-1900's. After World War II (1939-1945), the province's pulp and paper industries expanded greatly, and shipbuilding became important in the Saint John area. Huge deposits of copper, lead, silver, and zinc were mapped in the Bathurst-Newcastle region in 1952 and 1953. In 1953 and 1957, the province completed hydroelectric plants that provided additional power for mining and manufacturing. The largest oil refinery in

The New Brunswick Museum

A fire in Saint John in 1837 destroyed a large part of the commercial district of the city. The lithograph at the left was made from a sketch by Thomas H. Wentworth, an eyewitness to the blaze.

Canada was constructed in Saint John in 1960.

A construction program related to the Bathurst-Newcastle metal ore deposits began in 1962 and was completed by 1968. Projects in the program included chemical and fertilizer plants, docking and shipping facilities, milling and manufacturing firms, mines, and pipelines. Mining of the metal ores began to boom in 1964, when the region's largest mine started operations.

In 1968, a hydroelectric plant opened at Mactaquac Dam on the St. John River near Fredericton. More than half the power from this plant goes to industries in the Bathurst-Newcastle region.

During the late 1960's, Premier Louis J. Robichaud, a Liberal, led the province in what he called a Program of Equal Opportunity. In this program, the provincial government took over the operation of all courts, schools, and health and welfare institutions. The action was taken to equalize the quality of services provided by such facilities throughout the province.

In 1969, the New Brunswick Legislative Assembly passed a law that made French an official language of equal status with English in the legislature itself and in courts, government offices, and schools. Later that year, the Canadian Parliament passed the Official Languages Act. This law requires federal facilities to provide service in both languages in districts where at least 10 percent of the people speak French. Under this law, the whole province of New Brunswick is considered a bilingual district for federal services.

Recent developments. New Brunswick's shipping facilities were enlarged in 1970 when North America's first deepwater terminal for oil tankers opened near Saint John. In 1971, a terminal to handle ships that carry cargo in large wooden containers opened at the port of Saint John. In the mid-1970's, the Saint John area experienced major industrial expansion. The chief projects included enlargement of shipbuilding and oil refining complexes. Food-processing, mining, and pulp and paper industries are also expanding in New Brunswick.

In 1982, the first nuclear power plant in Canada's Atlantic Provinces began operation at Point Lepreau. In 1984 and 1985, large potash deposits in southern New Brunswick's Sussex area were brought into production. In 1997, however, continued flooding in the larger of the two mines in the area caused it to be closed. Today, a major concern of provincial leaders is how to provide jobs for the growing labor force.

In 1997, Confederation Bridge opened. It extends over the Northumberland Strait to connect New Brunswick and Prince Edward Island. T. W. Acheson and B. J. Grant

New Brunswick, *BRUHNZ wihk,* **University of,** is a provincially supported school with campuses located in Fredericton and Saint John, New Brunswick. It offers courses in administration, arts, computer science, data analysis, education, engineering, forest engineering,

forestry, law, marine biology, nursing, office management, physical education and recreation, and science. The university grants bachelor's, master's, and doctor's degrees. It was formed in 1785 as the Provincial Academy of Arts and Sciences. It took its present name in 1859.

Critically reviewed by the University of New Brunswick

New Caledonia is an overseas possession of France. It lies in the South Pacific Ocean, about 1,200 miles (1,930 kilometers) northeast of Sydney, Australia. For location, see **Pacific Islands** (map). New Caledonia consists of one main island, also called New Caledonia, or Grand Terre; the Loyalty Islands; the Bélep Islands; the Isle of Pines; and a few uninhabited islands. The mountainous main island covers 6,467 square miles (16,749 square kilometers). The rest of the islands have a total area of only 899 square miles (2,330 square kilometers).

New Caledonia has a population of about 197,000. Nouméa, on the main island, is the capital and only city. Melanesians, also called Kanaks, are the largest group of people and make up about two-fifths of the population. Europeans are the second largest group. Others include Indonesians, Polynesians, and Vietnamese.

New Caledonia is one of the world's leading producers of nickel. Nickel mining and smelting are the leading industries. Other minerals produced in New Caledonia include chromite and cobalt. Farmers raise their own food and small amounts of coffee and copra for export. Tourism is another important industry.

New Caledonia's governmental responsibilities are shared by a locally elected congress and a French official appointed by the French government. The congress appoints a president and up to 10 other officials to carry out executive functions.

Melanesians, probably from New Guinea, reached New Caledonia at least 4,000 years ago. In 1774, James Cook, a British navigator, became the first European to land on the main island. He called it New Caledonia because it resembled Scotland *(Caledonia* in Latin). France took possession of New Caledonia in 1853. The United States had a large military base on the main island from 1942 to 1945. In the 1980's, many Kanaks demanded independence for New Caledonia. In a referendum held in 1987, New Caledonians voted to continue French control. But the Melanesians continued to demand independence. In 1988, violence erupted between some Kanaks and French officials. Later that year, voters approved a peace agreement. In a referendum held in 1998, New Caledonians voted in favor of greater self-government. Nancy Davis Lewis

Shostal

Nouméa, the capital of New Caledonia, is the only city on the main island, called New Caledonia or Grand Terre.

New Deal was President Franklin D. Roosevelt's program to pull the United States out of the Great Depression in the 1930's. The New Deal did not end the Depression. But it relieved much economic hardship and gave Americans faith in the democratic system at a time when other nations hit by the Depression turned to dictators. Roosevelt first used the term *new deal* when he accepted the Democratic presidential nomination in 1932. "I pledge you, I pledge myself, to a new deal for the American people," he said.

When Roosevelt became president on March 4, 1933, business was at a standstill and a feeling of panic gripped the nation. The stock market crash in October 1929 had shattered the prosperity most Americans enjoyed during the 1920's. The Depression grew worse during the early 1930's. Banks, small businesses, and factories closed. Workers lost their homes and farmers lost their farms because they could not meet mortgage payments. An estimated 12 million to 15 million Americans—1 out of 4 workers—had no jobs.

In his inaugural address, Roosevelt expressed confidence that the nation could solve its problems. "The only thing we have to fear is fear itself," he said.

The Hundred Days

Roosevelt called Congress into special session on March 5, 1933. From March 9 to June 16, Congress passed a series of important laws aimed at speeding economic recovery, providing relief for victims of the Depression, and reforming financial, business, agricultural, and industrial practices. Most laws passed swiftly and with little opposition. Never before had Congress approved so many important laws so quickly. The session then became known as *The Hundred Days.*

The programs and policies that made up the New Deal did not come from one person. Some were Roosevelt's ideas. Others were proposed by members of the "Brain Trust," a group of unofficial presidential advisers. Congressional leaders suggested others. Some programs conflicted with each other. For example, the Economy Act cut the salaries of federal employees while the Public Works Administration increased government spending. But Roosevelt was willing to experiment and tried the ideas of one group and then another.

Helping savers and investors. Roosevelt's first goal was to end the banking crisis. A wave of bank failures in February had frightened the public. Depositors rushed to withdraw their money before their banks failed. Roosevelt declared a "bank holiday," closing all banks on March 6. On March 9, Congress passed the Emergency Banking Act. The new law allowed government inspectors to check each bank's records and to reopen only those banks that were in strong financial condition. Within a few days, half the nation's banks reopened. These banks held 90 percent of the country's total deposits. This action did much to end the nation's panic.

The Glass-Steagall Banking Act of June 1933 provided

further protection for investors. It gave the Federal Reserve Board more power to regulate loans made by banks and created the Federal Deposit Insurance Corporation (FDIC), which first insured bank deposits up to $2,500 and later, in July 1934, up to $5,000.

Congress's passed the Securities Act of 1933, also called the Truth-in-Securities Act, in May 1933. This law required firms issuing new stocks to give investors full and accurate financial information. Congress created the Securities and Exchange Commission (SEC) in 1934 to regulate the sale of securities and to curb unfair stock market practices.

Helping the farmers. The Agricultural Adjustment Administration (AAA), created in May 1933, tried to raise farm prices by limiting production. The AAA used funds raised through a tax on processors of farm products to pay farmers not to produce as much as they had before. Farmers limited production by not planting crops on part of their land. The plan increased farm income, but critics said farmers should not cut food and cotton production at a time when people were hungry and needed clothing. The Supreme Court of the United States declared the AAA unconstitutional in 1936. The government then paid farmers to leave some land vacant as part of new soil conservation programs.

Helping industry and labor. The National Industrial Recovery Act of June 1933 was one of the most important of the new laws. This act created the National Recovery Administration (NRA) to enforce codes of fair practices for business and industry. Representatives of firms within each industry wrote the codes.

The industrial codes set minimum wages and maximum hours, and supported the right of workers to join unions. The codes primarily aided business. They allowed member firms to set standards of quality and establish the lowest prices that could be charged for goods. The Supreme Court declared the National Industrial Recovery Act unconstitutional in 1935, and the NRA was abolished (see **Schechter v. United States**).

Helping the needy. The Civilian Conservation Corps (CCC) launched the New Deal relief program. The CCC put young men from needy families to work at useful conservation projects, such as planting trees and building dams. The Federal Emergency Relief Administration provided the states with money for the needy. The Public Works Administration (PWA) created jobs for large numbers of people. It built thousands of schools, courthouses, bridges, dams, and other public works projects. The Home Owners Loan Corporation (HOLC) provided money at low interest for persons struggling to pay mortgages. The Tennessee Valley Authority (TVA) built dams to control floods and to provide electricity for residents of the Tennessee River Valley.

The Second Hundred Days

Congress approved several important relief and reform measures in 1935. These laws became the heart of the New Deal's lasting achievements. Most of the new laws were passed during the summer, and some historians call this period *The Second Hundred Days.* Some of the most important new measures were the Works Progress Administration (WPA), the National Labor Relations Act, and the Social Security Act.

Works Progress Administration provided jobs building highways, streets, bridges, parks, and other projects intended to have long-range value. It also cre-

Leading New Deal agencies

AAA	—	Agricultural Adjustment Administration. Founded in 1933 to advise and assist farmers, and to regulate farm production.
CCC	—*	Civilian Conservation Corps. Founded in 1933 to provide jobs for the unemployed.
CCC	—*	Commodity Credit Corporation. Founded in 1933 to support the Department of Agriculture.
FCA	—	Farm Credit Administration. Founded in 1933 to provide a credit system for farmers by making long-term and short-term credit available.
FCC	—*	Federal Communications Commission. Founded in 1934 to regulate radio, telephone, and telegraph systems.
FCIC	—	Federal Crop Insurance Corporation. Founded in 1938 to provide insurance protection against unavoidable loss of certain crops.
FDIC	—*	Federal Deposit Insurance Corporation. Founded in 1933 to insure bank deposits.
FERA	—	Federal Emergency Relief Administration. Founded in 1933 to cooperate with the states in relieving hardships caused by unemployment and drought.
FHA	—*	Federal Housing Administration. Founded in 1934 to insure private lending companies against loss on home-mortgage loans and on loans for improving small properties.
FSA	—	Farm Security Administration. Founded in 1937 to help farmers buy needed equipment.
HOLC	—	Home Owners Loan Corporation. Founded in 1933 to grant long-term mortgage loans at low cost to homeowners in financial difficulties.
NLRB	—*	National Labor Relations Board. Founded in 1935 to administer the National Labor Relations Act.
NRA	—*	National Recovery Administration. Founded in 1933 to carry out plans made by the National Industrial Recovery Act to fight the depression.
NYA	—	National Youth Administration. Founded in 1935 to provide job training for unemployed youths and part-time work for needy students.
PWA	—	Public Works Administration. Founded in 1933 to increase employment and purchasing power through the construction of useful public works, such as bridges, in the various states.
REA	—*	Rural Electrification Administration. Founded in 1935 to aid farmers in the electrification of their homes.
SEC	—*	Securities and Exchange Commission. Founded in 1934 to protect the public from investing in unsafe securities and to regulate stock market practices.
SSB	—	Social Security Board. Founded in 1935 to secure a sound social security system.
TVA	—*	Tennessee Valley Authority. Founded in 1933 to help develop the resources of the Tennessee Valley.
USHA	—	United States Housing Authority. Founded in 1937 to aid in the development of adequate housing throughout the nation.
WPA	—*	Works Progress Administration. Founded in 1935 to provide work for needy persons on public works projects. Renamed Work Projects Administration in 1939.

New Deal projects, such as this road construction project in New York City, put many Americans back to work. The New Deal helped the U.S. recover from the Great Depression.

ated work for artists, writers, and performers. The WPA provided some work for about 8 $\frac{1}{2}$ million people. It was renamed the Work Projects Administration in 1939.

The National Labor Relations Act guaranteed workers the right to organize unions. During the next few years, the American Federation of Labor (AFL) and the new Congress of Industrial Organizations (CIO) enrolled millions of workers in labor unions.

The Social Security Act provided pensions for the aged and insurance for the jobless. The law also provided payments for the blind and disabled and for needy children. See **Social security.**

The final measures

Roosevelt proposed a plan to add justices to the Supreme Court in 1937. Critics charged that he was trying to "pack" the court with judges who favored the New Deal. Roosevelt's plan divided the Democrats and cost him his solid support in Congress (see **Roosevelt, Franklin D.** [The Supreme Court]). Congress passed only two other important reform measures after that. The first was the United States Housing Act of 1937, which provided money for more federal public housing projects. The second was the Fair Labor Standards Act of 1938, which set a minimum wage of 25 cents an hour and a maximum workweek of 44 hours, with extra pay for extra hours. The Fair Labor Standards Act also banned children under the age of 16 from working in factories, and during school hours.

The economy faltered late in 1937. Farm prices dropped, and the number of jobless rose from about 5 million in September 1937 to almost 11 million in May 1938. The Democrats retained majorities in both houses of Congress in the 1938 elections, but Republicans gained back seats for the first time since 1928. Strong opposition in Congress forced Roosevelt to avoid further reforms, and he soon became occupied primarily with the growing threat of Nazi Germany.

Results of the New Deal

Most scholars agree the New Deal relieved much economic distress and brought about a large measure of recovery. But about 8 million Americans still had no jobs in 1940. Military spending for World War II, rather than the New Deal, brought back prosperity.

The New Deal tried to spend its way back to prosperity. It spent billions of dollars to create jobs for unemployed persons, so they could buy more and get business going normally. New Deal programs cost more money than the government received through taxes. The government borrowed much of the money it needed by selling bonds, and the federal debt grew from \$22 $\frac{1}{2}$ billion in 1933 to about \$40 $\frac{1}{2}$ billion in 1939.

The New Deal caused major political changes. The Democratic Party, generally a minority party since the American Civil War (1861-1865), became the largest political party. Its main strength shifted from the rural South to the urban North. Immigrants, union members, urban intellectuals, and reformers gained a stronger voice in party decisions.

Most scholars also agree that the New Deal preserved the essentials of the American free enterprise system. Profits and competition continued to play a leading part in the system. However, the program added new features. The federal government assumed responsibility for the economic security of the people and the economic growth of the nation. After the New Deal, the government's role in banking and public welfare grew steadily. Also, organized labor became an important force in national affairs. David A. Shannon

New Delhi, *DEHL ee* (pop. 294,783), is the capital of India. It lies on the west bank of the Yamuna River in northern India, near the Thar, or Great Indian, Desert. New Delhi is about 3 miles (5 kilometers) south of Delhi, the former capital (see **India** [political map]).

New Delhi is an attractive, spacious city. It contrasts sharply with the crowded, older city of Delhi. The design of New Delhi and some of its buildings reflects the influence of the British, who ruled India from 1858 to 1947. New Delhi was built in the early 1900's to replace Delhi as India's capital. It became the capital in 1931.

The city. New Delhi is a carefully planned city. It has wide, treelined avenues, and many gardens and open areas. Huge government buildings, including Parliament House and a government office building called the Secretariat, dominate the center of the city. Large houses, originally built for government officials, and smaller houses for servants are nearby.

Rashtrapati Bhavan (Presidential House), the official residence of the president of India, stands west of the

WORLD BOOK photo by David R. Frazier

New Delhi, the capital of India, is a carefully planned city. Its wide, treelined avenues provide plenty of space for traffic and pedestrians. Tall, modern buildings dominate the skyline.

Secretariat. This majestic, copper-domed palace has 340 rooms. Several blocks east are white palaces that once were winter homes of Indian princes. The government turned most of the palaces into offices or museums after India became independent in 1947. The 30,000-seat National Sports Stadium is east of the palaces.

The southern part of the city includes the Diplomatic Enclave, an area set aside for foreign embassies and fine residences. High government officials of other countries have offices on a street called *Shanti Path* (Peace Boulevard). A temple of the Bahá'í faith is located south of the capital. The temple, built in the shape of a lotus blossom, was completed in 1986.

New Delhi has many small neighborhoods and suburbs with distinctive bazaars. Many of these neighborhoods were settled by refugees from the section of India that became part of Pakistan in 1947. New Delhi also has several beautiful gardens, of which the Mughal Gardens at Rashtrapati Bhavan are the best known.

Connaught Place, the business center of New Delhi, lies north of the Secretariat and Parliament House. It is surrounded by a fashionable shopping area.

Economy. The government of India is the main employer in New Delhi. The city has no factories. Craftworkers sell products in the Central Cottage Industries Emporium, a building near Connaught Place.

History. In 1912, the capital of India was moved from Calcutta (now Kolkata) to Delhi. Plans were also made to build a new capital just outside Delhi, away from that crowded city. The English architects Sir Herbert Baker and Sir Edwin L. Lutyens planned the layout and designed buildings for the new city. Construction began in 1912 but was delayed during World War I (1914-1918). In 1931, New Delhi was completed and became the capital of India. The city remained the capital after India gained independence from the United Kingdom in 1947. India's Constitution went into effect on Jan. 26, 1950. Since then, January 26 has been a national holiday called Republic Day. New Delhi has an annual Republic Day celebration, which features a huge parade. Robert LaPorte, Jr.

New Democratic Party (NDP) is a social-democratic political party in Canada. The NDP supports strong social welfare policies and associates itself with the Canadian labor movement. It favors a more equal distribution of wealth among Canadians and has supported controls on foreign investment in Canada. The NDP criticizes the country's participation in such military alliances as the North Atlantic Treaty Organization (NATO) and the North American Aerospace Defense Command (NORAD). The NDP has never had enough representation in Canada's Parliament to form a national government on its own. However, at times, it has controlled the governments of some of Canada's provinces.

The New Democrats trace their beginnings to another political party, the Co-operative Commonwealth Federation (CCF). The CCF, founded in 1932, favored placing financial institutions, health services, and key industries under government control. In 1961, the CCF formed an alliance with unions in the Canadian Labour Congress and established the New Democratic Party. Thomas C. Douglas, the premier of Saskatchewan, became the first leader of the NDP. But Douglas could not lead the New Democrats to national success. Under him, the NDP never gained much support in Quebec and the easternmost provinces of Canada.

The party had its greatest influence in Canadian federal politics from 1972 to 1974. The Liberal Party under Prime Minister Pierre Trudeau lacked a majority in Parliament. Trudeau relied on the support of the New Democrats, then led by David Lewis, a labor lawyer. During this time, the NDP's control of the balance of power resulted in the expansion of Canadian social programs. It also helped in the creation of the Foreign Investment Review Agency (FIRA)—now Investment Canada—to oversee international investments in Canadian business. In the 1974 national elections, however, the Liberals gained a majority in Parliament. As a result, the NDP's national influence weakened.

The NDP has enjoyed more success at the provincial level. New Democrats have formed governments most often in Saskatchewan, Manitoba, and British Columbia. They have also been in power in Ontario and the Yukon Territory. But the weakness of the national party organization has caused some people to suggest that the NDP merge with the Liberal Party. Those who do not favor a merger with the Liberals say that the New Democrats should renew themselves as a party of the left wing opposed to *globalization*. Globalization is the trend toward increased business, cultural, and governmental interaction across international borders (see **Globalization**).

New England is a region that consists of six states: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont. For information on this region, see **United States** (Regions). See also the articles on the states that make up the region.

New England, Dominion of, was a group of English colonies in America united in 1686 by King James II of England. The colonies in the dominion were Connect-

icut, Massachusetts, New Hampshire, East Jersey, West Jersey, New York, Plymouth, and Rhode Island. King James believed that if the colonies united under a single government, they would function better and could more easily defend themselves against England's major military rival, France. But the colonists had no voice in the government, and most of them opposed the dominion. James was overthrown in England in 1688. The dominion broke up the next year. Donna J. Spindel

New England Confederation was organized in 1643. Four colonies—Massachusetts, Plymouth, Connecticut, and New Haven—formed the United Colonies of New England, as it was called. They worked to solve boundary disputes and to meet the increased danger of attacks by the Dutch, French, and Indians. Maine, New Hampshire, and Rhode Island were excluded from membership for political and religious reasons.

The four colonies agreed to "enter into a firm and perpetual league of friendship and amity, for offence and defence, mutual advice and succor upon all just occasions, both for preserving and propagating the truth and

WORLD BOOK map

The New England Confederation was formed in 1643 by four New England colonies. The confederation hoped to discourage attacks by New Netherland, other nearby colonies, and Indians.

liberties of the gospel, and for their own mutual safety and welfare."

Two commissioners from each member colony met each year to consider problems that were of mutual interest. The confederation had great power in theory, but, in practice, it could only advise. Under confederation regulations, three colonies comprised a decisive majority. A test of the confederation's power came in 1653, when Plymouth, Connecticut, and New Haven favored a war against the Dutch of New Netherland. The fourth colony, Massachusetts, did not agree and absolutely refused to yield. This action lessened the prestige of the organization. After 1664, the commissioners met only every three years, and in 1684 the confederation came to an end. Despite serious weaknesses, the confederation provided valuable experience in discussion and cooperation among the colonies. It also helped prevent the smaller colonies from being totally dominated by Massachusetts. Albert E. Van Dusen

New France was the French colonial empire in North America. The empire began during the early 1600's and lasted about 150 years. At its height in the early 1700's, New France included three colonies—Canada, Acadia, and Louisiana. Canada and Acadia covered much of what is now eastern Canada. Louisiana lay in the Mississippi River Valley of the present-day United States.

The term *New France* often refers only to the colony of Canada, where about 75 percent of the empire's settlers lived. France lost this territory to Britain in the Seven Years' War (1756-1763). But the French influence on Canadian culture still remains strong. About 6 million Canadians, chiefly in the provinces of Quebec, Ontario, and New Brunswick, speak French. French, along with English, is an official language of Canada.

Exploration and settlement. The first official French expedition to North America occurred in 1524. That year, the Italian navigator Giovanni da Verrazzano explored the Atlantic Coast for King Francis I of France. The French explorer Jacques Cartier sailed to Canada in 1534, 1535, and 1541. He became the first European to reach the Gulf of St. Lawrence. Cartier claimed the area surrounding the Gulf of St. Lawrence for France.

During the 1500's, French fishing crews began to drop their nets off the coast of what is now the Canadian province of Newfoundland and Labrador. They also started to trade kettles, knives, and other European goods to local Indians for furs. Canadian furs, especially beaver pelts, became increasingly valuable because of the growing popularity of fur hats in Europe.

In 1604, the French explorers Pierre du Gua (or du Guast), Sieur de Monts, and Samuel de Champlain established Acadia along the Atlantic coast. Champlain founded the settlement of Quebec along the St. Lawrence River in 1608. Soon afterward, French fur traders established other settlements on the St. Lawrence River. Roman Catholic missionaries founded Montreal, at first named Ville-Marie, in 1642.

New France grew slowly. It had only a few thousand settlers by 1660. In 1663, King Louis XIV made New France a *royal province,* or colony, of France. Between 1665 and 1672, he sent over about 2,500 settlers. Among them were many women intended as brides for the soldiers and settlers already in the colony.

In 1672, Louis de Buade, Comte de Frontenac, became the governor general of New France. He encouraged fur traders and explorers to help expand the colony. Traders then began to establish a number of posts along the Great Lakes and Hudson Bay. Also, in 1672, the French-Canadian explorer Louis Jolliet and Jacques Marquette, a French missionary, became the first white people to find the upper part of the Mississippi River. The French explorer René-Robert Cavelier, Sieur de La Salle, followed the Mississippi to the Gulf of Mexico in 1682. He claimed the river valley for France and named it Louisiana to honor Louis XIV. In 1699, Pierre Le Moyne, Sieur d'Iberville, established the colony of Louisiana. The French built a chain of forts to link Louisiana with the rest of New France. The population of New France rose from almost 25,000 in 1720 to about 65,000 in 1760.

Colonial life. The chief governing officials of the royal province were the *governor general* and the *intendant.* The governor general supervised the army and relations with the Indians. The intendant controlled finance, law enforcement, and other local matters.

The fur trade was the chief economic activity in New France. Many young colonists were frontiersmen who

The city of Quebec served as the capital of New France. Quebec was also a religious and commercial center. This engraving from the 1700's shows a view of the city from the St. Lawrence River.

Granger Collection

made their living trading for furs. They were called *coureurs de bois* (vagabonds of the forest). Most coureurs de bois became farmers after they married, and agriculture grew in importance as an economic activity. Farmers raised livestock and grew mostly wheat and oats. Fishing and lumbering also developed into important industries. In addition, the colony had a brewery, an ironworks, and a shipyard.

By law, all colonists were Roman Catholics, and the Catholic church played a major role in New France. Female religious orders provided hospitals in the towns. They also ran schools.

The towns of Quebec, Montreal, and Trois-Rivières were the centers of trade and culture. Church and government officials and wealthy landowners lived in splendid stone homes in the towns. Merchants and craftworkers had smaller stone houses. Farmers lived on sections of land called *seigneuries.* The king of France granted the seigneuries to nobles, religious groups, military officers, and merchants, who rented the land to farmers. The landowners provided their tenants with a flour mill and a church. Most farmers lived in one- or two-room log cabins.

Both farmers and townspeople in New France often enjoyed dances and other merry social gatherings. Members of the upper class attended grand balls at the residence of the governor general. In winter, the colonists had sleighing parties and held horse races on the frozen rivers.

The British conquest. French and English settlers began fighting for control of the fur trade in the St. Lawrence River Valley in the early 1600's. The English colonies developed along the eastern coast of North America. French expansion during the 1600's angered the English colonists, who also wanted to expand westward.

Members of the two groups and their Indian allies fought each other in a series of wars from 1689 to 1763. Great Britain gained Newfoundland, the Nova Scotia region of Acadia, and the French territory around Hudson Bay under the Treaty of Utrecht in 1713. During the next 30 years, the French built forts in the Ohio Valley and across the southern parts of what are now the Canadian provinces of Manitoba, Ontario, and Saskatchewan. Fighting began again in 1744. British colonists captured the French fort at Louisbourg on Cape Breton Island in 1745, but the French regained it in 1748.

The final struggle began in 1754. It is known as the French and Indian War in the United States. The conflict spread to Europe in 1756 and is called the Seven Years' War in Canada and Europe. The French were winning until 1758, when British forces captured Louisbourg and several key inland forts. In 1759, the British captured Quebec. The fighting ended when the British took Montreal in September 1760. France gave up Canada and part of Louisiana to Britain in the Treaty of Paris in 1763. France had given the rest of Louisiana to Spain in 1762. France reacquired Louisiana from Spain during the early 1800's and sold it to the United States in 1803.

New Guinea is a large tropical island in the Pacific Ocean, north of Australia. It is the world's second largest island. Greenland is the only island larger than New Guinea.

New Guinea has an area of about 342,000 square miles (885,780 square kilometers) and a population of about 6 million. Rugged mountains cover much of the interior of the island. Most of this area has a cool climate. In contrast, the lowlands along the northern and southern coasts are hot and humid.

Most New Guineans live in villages in rural areas. Almost half of the island's people dwell in isolated mountain valleys. Until the 1930's, these New Guineans had little contact with the outside world.

Political units. The island of New Guinea contains part of one nation and all of another. Irian Jaya is part of Indonesia, and Papua New Guinea is an independent country.

Irian Jaya, sometimes called West Papua, covers the western half of New Guinea and some small nearby islands to the north and west. Three of Indonesia's provinces occupy this region. See **Indonesia** (table: The chief islands; New Guinea).

Papua New Guinea occupies the eastern half of New Guinea and some islands to the east, including those of the Bismarck Archipelago. Formerly a territory of Australia, Papua New Guinea became an independent nation in 1975. Port Moresby, a city on the southeast coast of New Guinea, serves as the nation's capital. See **Papua New Guinea**.

People. Most New Guineans are Melanesians, a people who are native to the Pacific islands. About 35,000 Asians, Australians, and Europeans also live on the island of New Guinea, most of them in coastal towns. Large numbers of people from other Indonesian islands have settled in Irian Jaya.

In the highlands, most of the villagers live in round thatched huts and grow sweet potatoes as their main food. Pigs provide most of their meat. Many lowland villagers build their houses on stilts to keep them cool and dry. Their chief food crops are bananas, taro roots, and yams. People who live in the swamps of the coastal lowlands eat mostly sago, a starch that is taken from various kinds of palm trees.

New Guineans speak more than 700 languages. Because of the number of languages, many people cannot communicate with neighbors who live only a short distance away. A growing number of eastern New Guineans speak Pidgin English, or Tok Pisin, as a second language. This *lingua franca,* or common language, enables speakers of different tongues to communicate with one another. In the west, many people speak Malay as a second language.

Land and climate. A great mountain system crosses New Guinea from east to west. It includes the Owen Stanley Range in the east and 16,503-foot (5,030-meter) Puncak Jaya, the highest point on the island, in the west. Mountain ridges, grassy plateaus, and deep, forested valleys cover much of the interior. Grasslands and jungles lie along the northern and southern edges of the island. Swamps with mangrove thickets border New Guinea in some areas.

Many streams and rivers flow down the mountain slopes and cross the lowlands. New Guinea's largest rivers, the Fly and Sepik, have large, swampy areas around them in the lowlands.

New Guinea's coastal lowlands have a hot, humid climate. The temperature and humidity drop as the altitude increases toward the center of the island. The annual rainfall in parts of New Guinea averages more than 200 inches (510 centimeters).

Native animals of New Guinea include crocodiles, tree kangaroos, and such snakes as the death adder, the Papuan black, and the taipan. The island also has many bright-colored birds and butterflies.

Economy of New Guinea is one of the least developed of any area in the world. Most of the people farm

New Guinea

WORLD BOOK maps

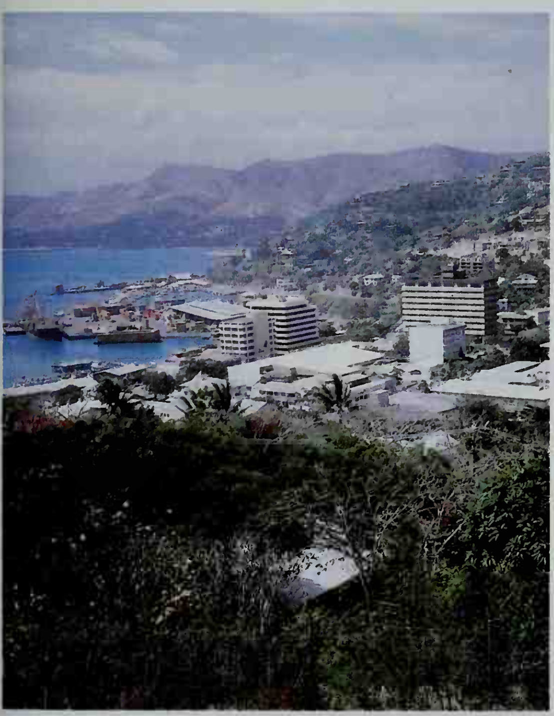
the land and grow most of their own food. Many farm people also produce goods that they sell, including coconuts, coffee, and cocoa. A few large plantations also produce cocoa, coconuts, and coffee.

Two large copper mines operate on New Guinea. One is near Nabire in Irian Jaya. Another is in Papua New Guinea, in mountains just east of the Irian Jaya border. These mines also yield small amounts of gold. New Guinea also has oil and natural gas deposits.

History. The earliest settlers in New Guinea probably migrated thousands of years ago from the Asian mainland by way of the Malay Peninsula and Indonesia. In 1526, Jorge de Meneses, the Portuguese governor of the Molucca Islands, became the first European to visit New Guinea. Dutch, English, French, and Spanish explorers stopped there during the next 300 years. The Netherlands claimed western New Guinea in 1828. In 1884, Germany gained the northeastern part of the island, and the United Kingdom took the southeastern part. The United Kingdom gave its territory to Australia in 1906. After Germany's defeat in World War I (1914-1918), the League of Nations made northeastern New Guinea a mandated territory under Australian rule (see **Mandated territory**).

The Japanese seized northern New Guinea in 1942, during World War II. However, by 1944, the Allies had reconquered the area. After the war ended in 1945, the northeastern part became the United Nations Trust Territory of New Guinea under Australian administration. Australia put the northeastern and southeastern units (now Papua New Guinea) under one government in 1949.

Indonesia gained independence from the Netherlands in 1949 and claimed western New Guinea. In 1962, the Netherlands agreed to turn over western New Guinea to the United Nations (UN). The UN placed the area under Indonesian administration in 1963, and Indonesia renamed it West Irian. In 1969, West Irians voted to remain part of Indonesia.



During the 1960's, some New Guineans in both West Irian and Papua New Guinea began demanding independence. In 1969, Indonesia put down an independence movement in West Irian. The province was renamed Irian Jaya in 1973. Australia granted Papua New Guinea total self-government over its internal affairs in 1973. In 1975, Papua New Guinea gained complete independence from Australia. David A. M. Lea

Beautiful autumn colors surround a picturesque pond in Grafton County. During the fall season, the New Hampshire countryside is ablaze with orange, red, and yellow leaves.

New Hampshire *The Granite State*

New Hampshire is a New England state of the United States that is noted for its natural beauty and year-round outdoor activities. In summer, vacationers flock to the state's rugged mountains, blue lakes, sandy beaches, and quiet villages. In the fall, visitors tour the countryside ablaze with red, orange, and yellow leaves. In winter, skiers race down snow-covered slopes and then warm themselves near crackling fires in friendly ski lodges.

The scenic beauty and other attractions bring millions of tourists from many parts of the world to tiny New Hampshire, and give the state a major source of income. But New Hampshire is more than a vacation wonderland. New Hampshire is the home of freedom-loving, industrious people who built a prosperous state and helped form a nation.

New Hampshire was first settled in 1623, just three years after the Pilgrims landed in Massachusetts. Early New Hampshire settlers traded in fish, lumber, and furs. They soon carved farms out of a wilderness and worked the land for food. Later, the people turned their skills and their state's resources to industrial development. They cut down trees for the giant lumber and papermaking industries. They took minerals from the mountains and hills to start a mining industry. They used the rivers and lakes as sources of power for mills and factories. And they built ships along the state's small Atlantic coastline. In all, the people of New Hampshire changed a wilderness into a farming society, and then into a thriving industrial state.

New Hampshire and its people have played important roles in United States history. On Jan. 5, 1776, New

A skier races down a slope during World Cup competition at Waterville Valley in New Hampshire's White Mountains.

Hampshire became the first of the 13 original colonies to adopt its own constitution. On June 21, 1788, it became the ninth state to ratify the United States Constitution. This act of ratification put the Constitution into effect. Since 1920, New Hampshire has held the nation's earliest presidential primary elections.

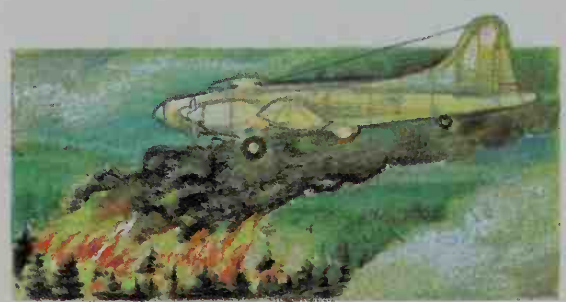
The U.S. Navy's first shipbuilding yard opened at Portsmouth in 1800. One of the country's first tax-supported public libraries was established at Peterborough in 1833. In 1853, Franklin Pierce of New Hampshire became the 14th President of the United States. Daniel Webster, a leading statesman and orator of the 1800's, was born in New Hampshire. So was Alan B. Shepard, Jr., the first American astronaut to travel in space. The great poet Robert Frost lived in New Hampshire for many years.

New Hampshire's large granite deposits give it the nickname of the *Granite State*. Concord is the capital of New Hampshire and Manchester is the largest city.

Interesting facts about New Hampshire

WORLD BOOK illustrations by Kevin Chadwick

The first state general library law was enacted by New Hampshire on July 7, 1849. The law permitted cities, towns, and school districts to raise taxes for the support of libraries. It also required that every public library established under the law be open for use by all citizens.



The Brattle organ, in historic St. John's Episcopal Church in Portsmouth, is said to be the oldest pipe organ in the United States. Built in England and shipped to the colonies, it dates back to at least 1708. The organ is still in good condition and is played on special occasions.

Brattle organ

The treaty ending the Russo-Japanese War was signed in 1905 in Portsmouth. President Theodore Roosevelt arranged the peace conference between the Russians and Japanese. He was awarded the 1906 Nobel Prize for peace in recognition of his work in ending the war.

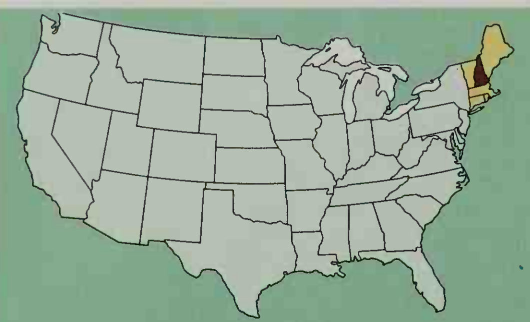
Artificial rain was first used to fight a forest fire on Oct. 29, 1947, near Concord. Scientists flew over the fire in airplanes and seeded clouds with dry ice to cause the rain. The experiment was part of Project Cirrus, a weather research program conducted by the General Electric Company, the U.S. Army Signal Corps, and the Office of Naval Research.

Fire fighting with artificial rain

John Cauvin, Studio One

A downtown Manchester plaza is a pleasant gathering place for local residents. Manchester is the largest city and one of the chief manufacturing centers of New Hampshire.

New Hampshire in brief



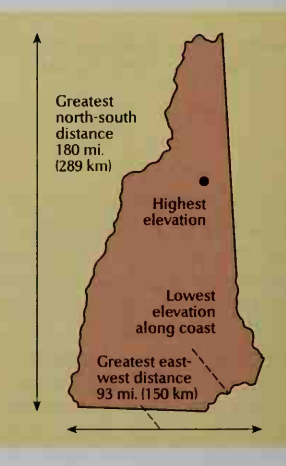
Symbols of New Hampshire

The state flag, adopted in 1909, bears the state seal. A laurel wreath with nine stars shows that New Hampshire was the ninth state to approve the U.S. Constitution. The seal, adopted in 1931, displays the Revolutionary War frigate *Raleigh,* which was built in Portsmouth. The American flag of 1777 flies at the ship's stern. A granite boulder in the foreground symbolizes the state's rugged terrain and the character of its people.

State flag

State seal

New Hampshire (brown) ranks 44th in size among the states and is the 3rd largest of the New England States (yellow).



The State Capitol is in Concord, the capital since 1808. Other capitals were Portsmouth (1679-1774), Exeter (1775-1781), and several different towns between 1781 and 1808.

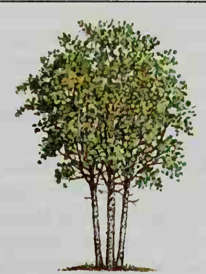
General information

Statehood: June 21, 1788, the ninth state.
State abbreviations: N.H. (traditional); NH (postal).
State motto: *Live Free or Die.*
State song: "Old New Hampshire." Words by John F. Holmes; music by Maurice Hoffmann.

Land and climate

Area: 9,283 sq. mi. (24,044 km²), including 314 sq. mi. (813 km²) of inland water.
Elevation: *Highest*—Mount Washington, 6,288 ft. (1,917 m) above sea level. *Lowest*—sea level along the Atlantic coast.
Coastline: 13 mi. (21 km).
Record high temperature: 106 °F (41 °C) at Nashua on July 4, 1911.
Record low temperature: −47 °F (−44 °C) at Mount Washington on Jan. 29, 1934.
Average July temperature: 68 °F (20 °C).
Average January temperature: 19 °F (−7 °C).
Average yearly precipitation: 42 in. (107 cm).

Important dates



- **1603** Martin Pring of England sailed up the Piscataqua River.
- **1620's** David Thomson and Edward Hilton founded New Hampshire's first European settlements.
- **1776** New Hampshire broke away from Britain and adopted a temporary constitution.
- **1784** The state adopted its present constitution.

Sources of information

For information about tourism, write to: New Hampshire Division of Travel and Tourism Development, 172 Pembroke Road, P.O. Box 1856, Concord, NH 03302. The Web site at www.visitnh.gov also provides information.
For information on the economy, write to: Department of Resources and Economic Development, 172 Pembroke Road, P.O. Box 1856, Concord, NH 03302.
The state's official Web site at www.state.nh.us also provides a gateway to much information on New Hampshire's economy, government, and history.

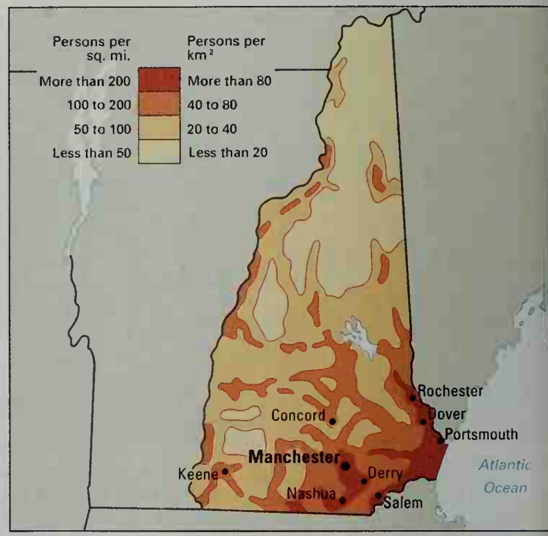
1788 New Hampshire became the ninth state on June 21.
1838 The first railroad in New Hampshire was completed.
1944 The International Monetary Conference was held in Bretton Woods.
1964 The New Hampshire sweepstakes lottery began. It was the first legal U.S. lottery since the 1890's.
1988 New Hampshire celebrated its statehood bicentennial.

People

Population. The 2000 United States census reported that New Hampshire had 1,235,786 people. The state's population had increased about 11 percent over the 1990 census figure, 1,109,252. According to the 2000 census, New Hampshire ranks 41st in population among the 50 states.

About one-third of the people live in the state's 13 incorporated cities. Six metropolitan statistical areas lie either entirely or partly within New Hampshire. Nashua and Manchester are the central cities of the only metropolitan areas located entirely within New Hampshire (see **Metropolitan area**). Manchester is the state's largest city. For the names and populations of these metropolitan areas, see the *Index* of the political map of New Hampshire.

In addition to Manchester, New Hampshire's 12 other incorporated cities, in order of size, are: Nashua, Concord (the capital), Rochester, Dover, Keene, Portsmouth, Laconia, Claremont, Lebanon, Somersworth, Berlin, and Franklin. See the articles on New Hampshire cities listed in the *Related articles* at the end of this article.



Many of New Hampshire's people are descendants of settlers who came from Canada and many European countries. The early settlers of New Hampshire came chiefly from England, Ireland, Scotland, and Wales. After the American Civil War, thousands of French Canadians and European immigrants came to New Hampshire to work in the state's mills, shops, and factories. Today, New Hampshire's largest population groups include people of English, Irish, French, French-Canadian, and German descent. African Americans, Asians, American Indians, and Hispanics together account for less than 5 percent of New Hampshire's population.

New Hampshire's people, like other New Englanders, have long been called *Yankees.* This nickname calls to mind traits that are traditionally associated with the people of New England. These traits include business ability, thrift, conservatism, and inventiveness. See **Yankee.**

Schools. The New Hampshire educational system dates from colonial days, when children of the settlers attended one-room schoolhouses. Some early schoolhouses still stand. Today's public schools operate under laws passed in 1789 and substantially revised in 1919. A seven-member State Board of Education and a commissioner of education administer state laws and regula-

Population density

The most thickly populated areas of New Hampshire are in the southeastern part of the state. The rugged White Mountain Region of northern New Hampshire has relatively few people.

tions. The governor and the executive council appoint the board of education members. The board appoints the commissioner of education. School districts are governed by local school boards.

Children from ages 6 through 15 must attend school in New Hampshire. For the number of students and teachers, see **Education** (table). Dartmouth, New Hampshire's oldest college, ranks among the 10 oldest U.S. universities and colleges. It was chartered in 1769.

Libraries. In 1833, Peterborough founded a free, tax-supported public library. Many historians believe that this was the first library of its kind in the United States. However, other historians claim that a library founded in Salisbury, Connecticut, was the first of this kind in the nation.

Today, almost every New Hampshire town has at least one public library. The State Library's rural libraries project serves residents of rural areas in the northern part of the state. The largest New Hampshire libraries that are not part of a university are the State Library in Concord and the Manchester City Library.

Museums. The Currier Gallery of Art in Manchester has the state's finest collection of paintings. Its collection includes many works by noted American and European artists. The Museum of New Hampshire History in Concord has a collection of art, photographs, and objects dealing with the state's history. The Canterbury Shaker Village, a restored community near Concord, and Strawbery Banke in Portsmouth also have historical exhibits.

Craig Aurness, West Light

Dartmouth is the oldest college in New Hampshire and one of the 10 oldest universities and colleges in the United States. The college was founded in 1769 in Hanover.

Visitor's guide

Visitors to New Hampshire enjoy a great variety of recreational activities in seven major vacation areas: the Great North Woods region, the White Mountains region, the Lakes region, the Seacoast region, the Merrimack Valley region, the Monadnock region, and the Dartmouth-Lake Sunapee region. Visitors to the Great North Woods enjoy such outdoor adventures as fishing, hunting, boating, and snowmobiling. The beautiful White Mountains, also in the north, attract skiers, hikers, campers, and sightseers. The skiing season generally lasts from mid-December to early April. The Lakes region of central New Hampshire provides fun for water-sports enthusiasts. The Seacoast region of the southeast has several beaches along the Atlantic Coast. Also in the south is the Merrimack Valley, where most of New Hampshire's chief cities are located. The Monadnock region, in the southwest, includes many natural beauty spots and some of the state's most interesting towns and villages. Many historic sites and educational institutions are in the Dartmouth-Lake Sunapee region in the west.

Many of New Hampshire's most popular annual events are sports contests. One of the state's best-known annual events is the League of New Hampshire Craftsmen's Fair at Mount Sunapee State Park.

New Hampshire Division of Travel and Tourism

Strawbery Banke in Portsmouth

Places to visit

Following are brief descriptions of some of New Hampshire's most interesting places to visit:

Cathedral of the Pines is an interdenominational outdoor place of worship at Rindge. In 1957, Congress made this shrine to the nation's war dead a national memorial.

Flume is a *chasm* (deep, narrow valley) 800 feet (240 meters) long at Franconia Notch. Visitors can view scenic wilderness on a $\frac{1}{2}$-mile (0.8-kilometer) tour through the Flume.

Hampton Beach runs along the state's seacoast. It is one of the finest beaches on the Atlantic Ocean, and visitors enjoy many pleasant summer activities there.

Lake Winnipesaukee is the largest body of water in the state. It covers about 70 square miles (180 square kilometers). The lake is a popular place for sightseeing, boating, fishing, and water sports.

Mount Washington, near Fabyan, features a cog railway that runs $3\frac{1}{2}$ miles (5.6 kilometers) to the mountaintop. The cog railway, which was completed in 1869, was the first railway of its kind in the United States. Mount Washington also has hiking trails and a scenic roadway.

Old Man of the Mountain, or Great Stone Face, is a natural granite formation on Profile Mountain that looks like a side of an old man's face. It stands about 40 feet (12 meters) high, and is the state's official trademark. It was made famous by Nathaniel Hawthorne's short story "The Great Stone Face."

Strawbery Banke, in Portsmouth, is a restored colonial seaport. It features homes built in the 1700's and 1800's, craft shops, and historical exhibits.

National forest and national historic site. The White Mountain National Forest lies in north-central New Hampshire. Part of it extends into Maine. Saint-Gaudens National Historic Site, in Cornish, near Claremont, is the state's only national historic site. It includes the home, studio, and gardens of American sculptor Augustus Saint-Gaudens.

State parks and forests. New Hampshire has 44 state parks, 12 historic sites, and 118 state forests. Many parks have lakes and groves of stately trees, especially white birch. For information on the state parks, historic sites, and forests, write to Director, Division of Parks, Department of Resources and Economic Development, P.O. Box 1856, Concord, NH 03302.

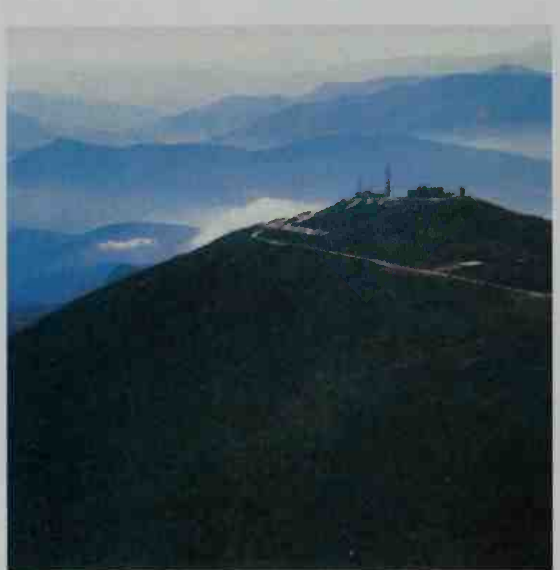
Land and climate

Land regions. New Hampshire has three main land regions. They are (1) the Coastal Lowlands, (2) the Eastern New England Upland, and (3) the White Mountains Region.

The Coastal Lowlands covers the extreme southeastern corner of the state. It is part of a larger land region of the same name that covers the entire New England coast. In New Hampshire, the region extends from 15 to 20 miles (24 to 32 kilometers) inland from the Atlantic Ocean. Along the coast, beaches provide popular recreational areas. Rivers winding through the Coastal Lowlands have long supplied water power for the region's industrial development. Great Bay is part of the Coastal Lowlands. Thousands of ducks and geese stop at the bay during their annual migrations.



The Eastern New England Upland covers most of southern New Hampshire. The entire Eastern New England Upland stretches from northern Maine to eastern Connecticut. In New Hampshire, the region consists of three areas: (1) the Merrimack Valley, (2) the Hills and Lakes region, and (3) the New Hampshire part of the Connecticut River Valley.

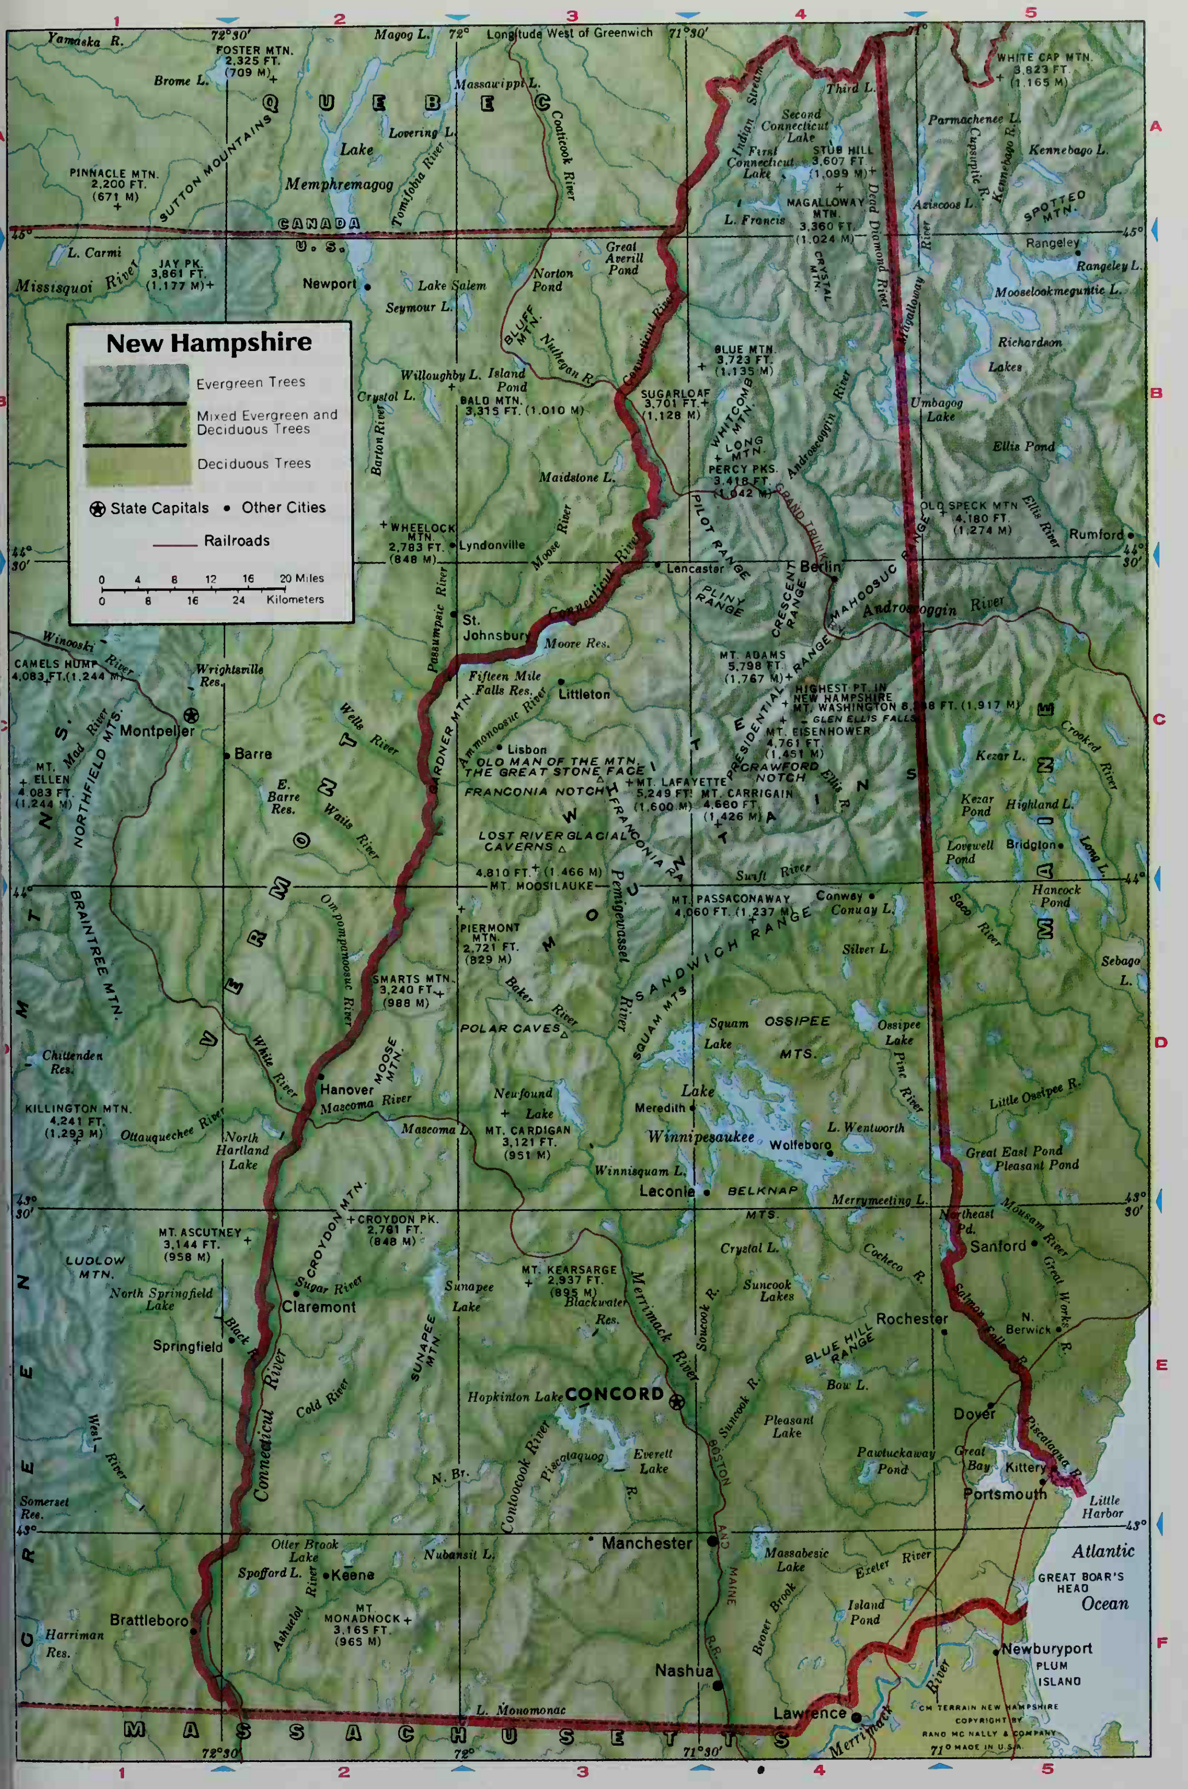
The Merrimack Valley extends northward from the Massachusetts border to central New Hampshire. It is named for the Merrimack River, which winds through the hilly, uneven valley. Large crops of hay and fruits grow in the rich soil between the hills. Many of the state's chief mill and factory towns are in the valley.

The Hills and Lakes region surrounds the Merrimack Valley on the east, north, and west. It extends in a broad half-circle from Maine almost to the Vermont border. Most of New Hampshire's large lakes nestle among forested hills in the region.

The Connecticut River Valley stretches in a long narrow strip down New Hampshire's western border. The Connecticut River flows through the area for 211 miles (340 kilometers). Rich farmland lies in the lowlands. Hardwood forests cover the hills. Hydroelectric plants supply power for public utilities. Their dams form long lakes in the valley.

The White Mountains Region lies north of the Eastern New England Upland. It has rugged mountains separated by narrow river valleys. Spruce, fir, and yellow birch provide wood for New Hampshire's paper mills

Manuel Dos Passos, Bruce Coleman Inc.



The Mount Washington Observatory stands on top of New Hampshire's highest peak. The observatory keeps daily records of weather conditions in the White Mountains.

Specially created for *The World Book Encyclopedia* by Rand McNally and World Book editors

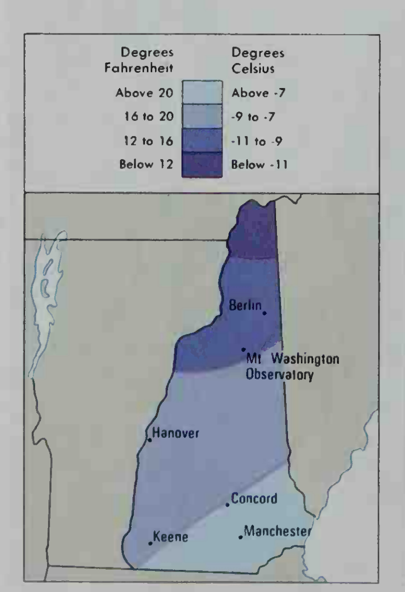
and other wood products industries. The White Mountains attract summer and winter tourists.

An area of forest-covered hills in Coos County forms the northernmost part of the region. Lumbering and paper manufacturing are this area's chief industries. Dairy and potato farms thrive in the west.

Coastline. New Hampshire has a general coast along the Atlantic of only 13 miles (21 kilometers). This is the shortest coastline of any state bordering an ocean. Hampton, Rye, and other beaches lie along the shore. A group of islands called the Isles of Shoals lies 9 miles (14 kilometers) offshore. Four—Lunging, Seavey, Star, and White—belong to New Hampshire. The others are part of Maine.

Mountains. The Presidential Range of the White Mountains has the highest peaks in New England. Mount Washington is the highest mountain in this 86-peak range and reaches 6,288 feet (1,917 meters). Several other peaks in the Presidential Range are more than 1 mile (1.6 kilometers) high. These include Mount Adams, 5,798 feet (1,767 meters); Mount Jefferson, 5,715 feet (1,742 meters); Mount Clay, 5,532 feet (1,686 meters); Mount Monroe, 5,385 feet (1,641 meters); and Mount Madison, 5,363 feet (1,635 meters). The Franconia Range, also in the White Mountains, includes the famous Profile Mountain, a shoulder of Cannon Mountain. Each year, thousands of sightseers visit the area to view the remarkable Old Man of the Mountain (or Great Stone Face), a profile of an old man's face caused by a rock formation near the mountaintop.

New Hampshire's mountains include five *monadnocks.* A monadnock is made up of rock that did not wear down when all the land around it was leveled by erosion. The monadnocks and their heights are Mount Moosilauke, 4,810 feet (1,466 meters); Mount Monadnock, 3,165 feet (965 meters); Mount Cardigan, 3,121 feet (951 meters); Mount Kearsarge, 2,937 feet (895 meters); and Sunapee Mountain, 2,743 feet (836 meters).



Rivers and lakes. New Hampshire's chief rivers rise in the mountainous north. The Connecticut River begins near the Canadian border and flows generally southward. It separates New Hampshire and Vermont. After leaving New Hampshire, the 407-mile (655-kilometer) river cuts across Massachusetts and Connecticut and empties into Long Island Sound. The Pemigewasset River flows south from Franconia Notch. The Merrimack River is formed where the Pemigewasset meets the Winnipesaukee River at Franklin. The Merrimack flows south into Massachusetts. The Androscoggin and Saco rivers flow through northeastern New Hampshire, and then cross into Maine. The Piscataqua and Salmon Falls rivers, in the southeast, form part of the New Hampshire-Maine border and empty into Portsmouth Harbor.

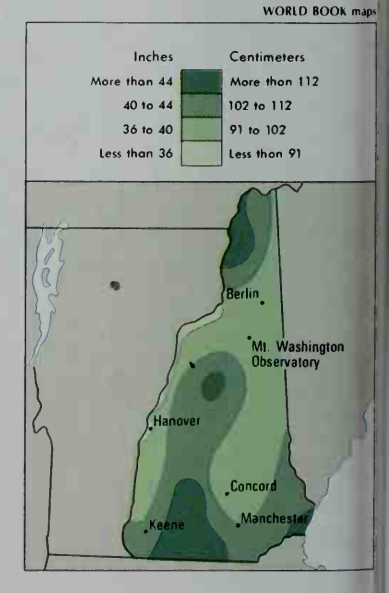
Average January temperatures

New Hampshire winters are cold with heavy snowfalls. Southeastern New Hampshire has the mildest temperatures.

Average July temperatures



New Hampshire has cool summers with low humidity. The temperatures are warmer in the southern part of the state.

Average yearly precipitation

Much of the state's precipitation comes as snow. The heaviest precipitation is in the south and far north of the state.

WORLD BOOK maps

About 1,300 lakes lie scattered throughout New Hampshire's hills and mountains. The largest, Lake Winnipesaukee, covers about 70 square miles (180 square kilometers) and has many islands. Other lakes include Ossipee, Squam, Sunapee, Umbagog (partly in Maine), and Winnisquam.

Plant and animal life. Forests cover about 85 percent of New Hampshire. Valuable trees include ashes, basswoods, beeches, birches, cedars, elms, firs, hemlocks, maples, oaks, pines, spruces, and tamaracks. Shrubs and flowering plants thrive in the state's forests. Shrubs include American elders, blueberries, mountain laurel, and sumacs. Wildflowers, which grow throughout New Hampshire, include black-eyed Susans, daisies, fireweed, gentians, goldenrod, purple trillium, violets, and wild asters.

Deer, rabbits, foxes, mink, beavers, raccoons, squirrels, and chipmunks are common throughout New Hampshire. Black bears and moose live in the northern forests. Game birds include ruffed grouse, pheasants, woodcocks, ducks, and geese. Among the many birds that nest in the state are robins, bluebirds, purple finches, sparrows, and warblers.

New Hampshire's freshwater fish include brook, brown, lake, and rainbow trout; largemouth and smallmouth bass; and landlocked salmon, pickerel, perch, whitefish, and bullheads. Saltwater fish found in New Hampshire include bluefish, cod, cunner, cusk, flounder, haddock, hake, mackerel, pollock, striped bass, and tuna. The state's coastal waters have clams, lobster, oysters, and shrimp.

Climate. New Hampshire has cool summers with low humidity. In winter, heavy snow falls in much of the state. January temperatures average about 16 °F (−9 °C) in the north and about 22 °F (−6 °C) in the south. The state's lowest temperature, −47 °F (−44 °C), was recorded at Mount Washington on Jan. 29, 1934. July temperatures average about 66 °F (19 °C) in the north and 70 °F (21 °C) in the south. The state's highest temperature, 106 °F (41 °C), was recorded at Nashua on July 4, 1911.

New Hampshire gets about 42 inches (107 centimeters) of *precipitation* (rain, melted snow, and other moisture) a year. The state's average yearly snowfall ranges from about 50 inches (130 centimeters) near the Atlantic Ocean to over 100 inches (250 centimeters) in the north and west.

Economy

Service industries provide the largest portion of New Hampshire's *gross state product*—the total value of goods and services produced in a state in a year. Major activities within the service industries include education, health care, real estate, and retail trade. However, manufacturing is the state's single most important economic activity. New Hampshire's beautiful seacoast, lakes, mountains, and unspoiled wilderness attract many tourists. Tourist activities contribute billions of dollars a year to the state.

New Hampshire's low tax rates have attracted many new businesses and residents to the state. New Hampshire has no general sales or personal income taxes. Thousands of people who work in Massachusetts live in New Hampshire to take advantage of the low taxes.

Production and workers by economic activities

Economic activities	Percent of GSP* produced	Employed workers: Number of people	Employed workers: Percent of total
Manufacturing	24	115,100	15
Finance, insurance, & real estate	22	51,200	7
Community, business, & personal services	19	234,500	32
Wholesale & retail trade	16	177,600	24
Government	8	81,200	11
Transportation, communication, & utilities	6	24,900	3
Construction	4	44,900	6
Agriculture	1	13,400	2
Mining	†	700	†
Total	100	743,500	100

*GSP = gross state product, the total value of goods and services produced in a year.
†Less than one-half of 1 percent.
Figures are for 1998.
Sources: U.S. Bureau of Economic Analysis and U.S. Bureau of Labor Statistics.

Natural resources. New Hampshire's climate and soils support dense forests. Minerals are found in many areas of the state, but the mining output is small.

Soil. Rock and a thin layer of soil cover most of New Hampshire's hills and mountains. The soil in New Hampshire's valleys is chiefly clay and loam, and coarse gravel and sand. The clay and loam support farm crops. The gravel and sand supply low-cost roadbuilding material.

Forests. Forests cover about 85 percent of New Hampshire. Commercially valuable softwood trees include balsam fir, cedar, hemlock, spruce, tamarack, and white pine. Valuable hardwoods include ash, basswood, beech, birch, maple, and oak.

Minerals. New Hampshire's chief mined resources are its deposits of granite, and sand and gravel. Large quantities of gray, red, and other kinds of granite give New Hampshire the nickname of the *Granite State.*

Service industries account for the largest part of the gross state product of New Hampshire. These industries are located in towns and cities throughout the state, especially in Dover, Manchester, and Nashua.

New Hampshire's leading service industry, in terms of the gross state product, is finance, insurance, and real estate. The state's growing urban areas and tourist trade make real estate a major part of this industry. Manchester is New Hampshire's major insurance and banking center. Large holding companies are headquartered in Hampton and Nashua.

Community, business, and personal services rank second among New Hampshire's service industries. Community, business, and personal services employ more people than any other industry in the state. This industry group consists of a variety of establishments, including private health care, law firms, vacation resorts, and repair shops. The White Mountains and the lake and

coastal areas of New Hampshire have many resorts.

Wholesale and retail trade form the third-ranking service industry in terms of the gross state product. Distributors of automobiles and groceries are important parts of the wholesale trade sector. Major retail establishments include discount stores, food stores, service stations, and restaurants.

Government ranks fourth among service industries in New Hampshire. Government services include the operation of public schools and hospitals, and military establishments. Many people are employed by the public school system. The Portsmouth area is the home of the Portsmouth Naval Shipyard.

Transportation, communication, and utilities rank fifth among the state's service industries. Transportation is less important in New Hampshire than in many other states, because most of the population lives within a relatively small area. More information about transportation and communication appears later in this section.

Manufacturing. Goods manufactured in New Hampshire have a *value added by manufacture* of more than $11 billion a year. Value added by manufacture represents the increase in value of raw materials after they become finished products.

Computer and electronic products are the state's leading type of product in terms of value added by manufacture. Computers are the leading product in this sector. They are assembled in Hudson, Manchester, Nashua, Portsmouth, and Salem. Telephone equipment and computer microchips are also important. Nashua has a large plant that makes military communication systems.

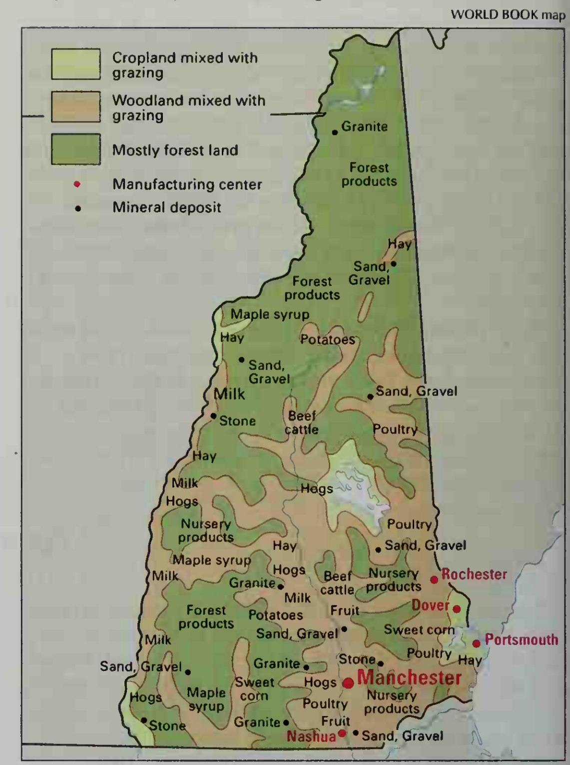
Machinery ranks second in terms of value added. Printing and metalworking machinery are among the leading machinery products. Other products from this area include ball bearings, machine tools, and equipment for making lenses and other optical instruments.

Other products made in New Hampshire include fabricated metal products, paper products, printed materials, and rubber and plastic products. Fabricated metal products are made in Laconia, Manchester, and Rochester. Paper mills are a major part of the economy in Coos County in the northern part of the state. New Hampshire's printed materials include business forms, magazines, and newspapers. Rubber and plastic products include shoes, belts and gaskets, and plastic films.

Agriculture. Farmland covers only 7 percent of New Hampshire. The state has approximately 2,900 farms.

Dairy farming is New Hampshire's most important agricultural activity. Dairy farms operate throughout the state, but they are especially numerous in the west along the Connecticut River. Other livestock products in New Hampshire include beef cattle, eggs, and hogs.

Hay, the state's leading field crop, is used mainly for cattle feed. Apples are New Hampshire's leading fruit crop. Potatoes and sweet corn are the most important vegetables. Other agricultural goods include greenhouse and nursery products and maple syrup. Many farms grow evergreens for use as Christmas trees.



Mining. Sand and gravel are the state's chief mined products. The leading areas for sand and gravel production are Hillsborough and Merrimack counties in the south-central part of the state. Sand and gravel are used to make roadbeds and concrete.

Building stone and crushed stone are also important

Economy of New Hampshire

This map shows the economic uses of land in New Hampshire and where the state's leading farm, mineral, and forest products are produced. Major manufacturing centers are shown in red.

WORLD BOOK map

mined products in New Hampshire. Several parts of the state have granite quarries. The Concord quarries, in Merrimack County, have supplied granite for many famous buildings in the United States.

Electric power. About 60 percent of New Hampshire's power needs are supplied by the Seabrook Nuclear Power plant, the state's only nuclear plant. About 25 percent is produced by coal-burning plants. Hydroelectric plants on the Connecticut River and petroleum-burning plants provide most of the rest of the state's electric power. The hydroelectric plants include Comerford Dam near Monroe, Wilder Dam near Hanover, and the Samuel C. Moore Dam near Littleton.

Transportation. New Hampshire's first railroad began operating in 1838. Today, six rail lines provide freight service in the state. New Hampshire has no local commuter rail service. The state's largest airport is in Manchester. The airport provides flights to Boston, New York City, and several other cities.

Roads and highways in the state total about 15,000 miles (24,000 kilometers). The New Hampshire Turnpike parallels the seacoast. The Spaulding Turnpike extends the seacoast turnpike from Portsmouth to the Union area. The Everett Turnpike links Concord and Massachusetts. Interstate 89 connects Concord to Vermont.

Communication. About 45 newspapers are published in New Hampshire. Eight of these are dailies. The state's leading newspapers include *Foster's Democrat* of Dover, *The Keene Sentinel,* the Laconia *Citizen, The*

(Nashua) *Telegraph,* the *Portsmouth Herald,* and *The Union Leader* of Manchester.

New Hampshire's first newspaper, the *New Hampshire Gazette,* began publication in 1756 at Portsmouth. The first radio station in the state, WLNH, was founded at Laconia in 1922. The first television station, WMUR-TV, began operation at Manchester in 1954. New Hampshire now has six television stations and about 70 radio stations. Cable television systems and Internet providers serve many communities.

Government

Constitution of New Hampshire took effect in 1784. It replaced a temporary Constitution that had been adopted in 1776. Constitutional amendments may be proposed by a three-fifths vote of each house of the New Hampshire state legislature, or by a constitutional convention. To become law, a proposed constitutional amendment needs the approval of two-thirds of the people voting on the issue in an election. A majority of the members of both houses of the New Hampshire legislature may propose a constitutional convention. The proposal must be approved by two-thirds of the citizens voting on it. If no constitutional amendment is proposed, the question of holding a convention must be voted on by New Hampshire residents every 10 years.

Executive. The governor of New Hampshire holds office for a two-year term. A governor may be reelected any number of times.

The executive branch of the New Hampshire government is somewhat unusual. The state has no lieutenant governor. However, it does have an executive council, which is made up of five members. Members of the executive council are elected by the people to two-year terms. Most major executive officials appointed by the governor must be approved by the executive council.

The state governors of New Hampshire

	Party	Term
Meshech Weare	None	1776-1785

*Democratic-Republican. †Also called the Know-Nothing Party.

These officials include the attorney general and the heads of many departments and commissions. The New Hampshire legislature elects the secretary of state and state treasurer to two-year terms.

Legislature is called the General Court. By law, it consists of a 24-member Senate and a 400-member House of Representatives. The U.S. House of Representatives is the only legislative body in the country with more members than the New Hampshire house. New Hampshire's towns and *wards* (divisions of cities) send from 1 to 11 legislators to the House of Representatives, depending on their populations. Representatives serve two-year terms. Voters in each of the 24 senatorial districts elect one senator to a two-year term. The senatorial districts are also based on population.

Legislative sessions begin the Wednesday after the first Tuesday of January. The state legislators receive a fixed salary of $200 for their two-year term. Their allowance for travel expenses covers 45 session days. Legislators are paid for 15 business days during special sessions of the General Court. The governor or the General Court can call special sessions of the New Hampshire legislature.

Courts. The Supreme Court of New Hampshire has a chief justice and four associate justices. The next lower court, the Superior Court, has a chief justice and 16 associates. A probate judge presides over each of the 10 probate courts, 1 in each county. The state also has municipal and district courts. The governor, with approval of the executive council, appoints all state and local judges. Judges may serve until they are 70 years old.

Local government in New Hampshire operates as one of the purest forms of democracy in the world. The state's 221 towns are nicknamed "little republics." They are so named because they have almost complete self-government. Each year, the voters assemble for a town meeting at which they can participate directly in governmental decisions. Voters elect town officials, approve budgets, and make decisions on other local business. The chief administrative officials at the town level are the *selectmen*. Most of the towns have three selectmen. Selectmen serve three-year terms. A few towns have abandoned or modified the traditional form of government by giving greater power to an elected council and, in some cases, to an appointed executive.

New Hampshire's 13 incorporated cities use either the mayor-council or city-manager form of government. The cities have *home rule*. That is, they are free to write and amend their own charters. Each of the state's 10 counties also has its own government. County officials include the sheriff, attorney, treasurer, register of deeds, register of probate, and county commissioners. These officials are elected to two-year terms.

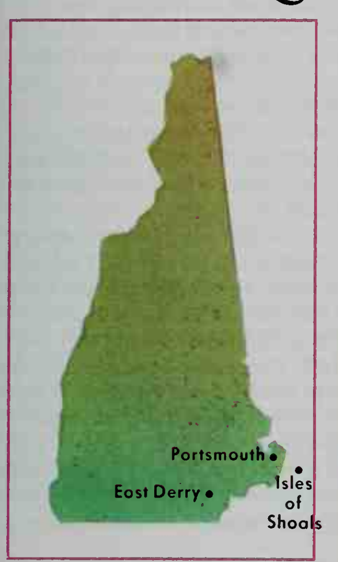
Revenue. Taxes account for about half of the state government's *general revenue* (income). About a fifth comes from federal government grants and programs. Charges for government services are another important source of general revenue. New Hampshire collects no general sales or personal income taxes. Taxes on corporate income, motor fuels, motor vehicle licenses, and public utilities are the largest sources of tax revenue. A lottery helps finance public schools. But the state's contribution to schools is low, and towns and cities rely heavily on local property taxes to fund public schools.

Politics. New Hampshire became a Republican state shortly before the Civil War (1861-1865). Until 1850, the state usually voted Democratic. But most of New Hampshire's people opposed slavery and then became Republicans. Since 1856, Republicans have won most of the major elective offices in New Hampshire. However, Democratic strength has increased since the 1960's.

Republicans have won New Hampshire's electoral votes in about three-fourths of the presidential elections since 1856. For the state's electoral votes and its voting record in presidential elections, see **Electoral College** (table).

History

Indian days. About 5,000 Indians probably lived in what is now New Hampshire before the Europeans came. Most belonged to two branches of the Algonquian Indian family—the Abenaki and the Pennacook. The Abenaki branch included the Ossipee and the Pequawket tribes. The Pennacook included the Amoskeag, Nashua, Piscataqua, Souhegan, and Squamscot tribes. New Hampshire Indians built wigwams of bark and skins. They hunted and fished, and farmed small fields of corn. The tribes lived together in peace, but often warred against their common enemy, the Iroquois.



Exploration. No one knows who were the first European settlers to reach New Hampshire. But wide-scale exploration of the area began in the early 1600's. In 1603, Martin Pring of England sailed a trading ship up the Piscataqua River. Pring and his crew may have landed in Portsmouth. The French explorer Samuel de Champlain landed on the New Hampshire coast in 1605. In 1614, the English captain John Smith reached the Isles of Shoals. He named them *Smith's Isles*.

Settlement. In 1619, England's King James I founded the Council for New England to encourage American settlement. The council granted David Thomson land in present-day New Hampshire. In 1623, Thomson and his followers settled at Odiorne's Point (now a part of Rye). Edward Hilton settled Hilton's Point (now Dover) in the 1620's. Some historians believe these settlements began at the same time. Others think Hilton's began later. Other early settlements include Strawbery Banke (now Portsmouth), established in 1630; and Exeter and Hampton, founded in 1638.

In 1622, the Council for New England gave John Mason and Sir Ferdinando Gorges a large tract of land in present-day New Hampshire and Maine. In 1629, the land was divided between the two men. In 1634, Mason and Gorges gained more land in the area. Mason called his land *New Hampshire*, after his native county, Hampshire, England. New Hampshire was made part of Massachusetts in 1641. But in 1680, King Charles II of England made New Hampshire a separate province. The king appointed John Cutt as New Hampshire's first provincial governor (then called president).

French and Indian wars were fought in New Hampshire and the rest of New England off and on from 1689

Historic New Hampshire

John Smith reached the Isles of Shoals off the coast of present-day New Hampshire in 1614. He named them *Smith's Isles.*

Robert Rogers of New Hampshire led a group of daring soldiers called Rogers's Rangers during the French and Indian War.

New Hampshire *minutemen* hurried to Boston to fight the British in 1775 after the Revolutionary War broke out in Massachusetts.

Alan B. Shepard, Jr., in 1961 became the first American to travel in space. Shepard was born in East Derry.

The Portsmouth Naval Shipyard was established in 1800. The shipyard built warships during World War I and specialized in constructing submarines during World War II.

Important dates in New Hampshire

1603 Martin Pring of England explored the mouth of the Piscataqua River.

1614 Captain John Smith of England landed on the Isles of Shoals.

1620's David Thomson and Edward Hilton made the first permanent settlements in New Hampshire.

1641 The Massachusetts Colony gained control of New Hampshire.

1680 New Hampshire became a separate royal colony.

1776 New Hampshire broke away from Britain and adopted a temporary constitution.

1784 New Hampshire adopted its present constitution.

1788 New Hampshire became the ninth state when it ratified the U.S. Constitution on June 21.

1853 Franklin Pierce of Hillsboro became the 14th President of the United States.

1944 The International Monetary Conference was held at Bretton Woods.

1961 Alan B. Shepard, Jr., of East Derry became the first American to travel in space.

1964 The New Hampshire sweepstakes lottery began. It was the first legal U.S. lottery since the 1890's.

1986 Christa McAuliffe, a Concord teacher, was among the seven crew members killed when the space shuttle *Challenger* broke apart shortly after take-off.

1996 Jeanne Shaheen, a Democrat, became the first woman to be elected governor of New Hampshire.

to 1763. The French and their Indian allies battled to gain control of the area from the British. Guided by Indians, French forces pushed down from Canada. Robert Rogers, the leader of a group of soldiers called Rogers's Rangers, and John Stark, both of New Hampshire, won fame as colonial military leaders during this period. See **French and Indian wars.**

Colonial New Hampshire was a rural society. Most of the people kept busy clearing the wilderness, building houses, and growing food. In 1767, when New Hampshire took its first census, the colony had 52,700 people. The king of England appointed the governor and governor's council. But the people elected assemblymen to represent them in colonial affairs.

The Revolutionary War. During the 1760's, the United Kingdom passed a series of laws that caused unrest in New Hampshire and the other American colonies. Most of these laws either imposed severe taxes or restricted colonial trade. In December 1774, Paul Revere rode to New Hampshire to warn of a British military build-up in Massachusetts. A band of New Hampshire residents, led by John Sullivan, seized military supplies from a British fort in New Castle. This was one of the first armed actions by colonists against the British.

After the Revolutionary War broke out in Massachusetts in 1775, hundreds of New Hampshire "minutemen" hurried to Boston to fight the British. New Hampshire was the only one of the 13 original colonies in which no actual fighting occurred.

New Hampshire became the first colony to form a government wholly independent of the United Kingdom. It did so on Jan. 5, 1776, when it adopted a temporary constitution. On July 9, 1778, New Hampshire ratified the Articles of Confederation (the forerunner of the United States Constitution). On June 21, 1788, New Hampshire became the ninth state to ratify the U.S. Constitution. New Hampshire's ratification put the Constitution into effect.

The 1800's. New Hampshire remained an agricultural state from 1800 until the outbreak of the American Civil War in 1861. But it began an industrial growth that has continued to the present day. Manchester, the largest industrial center, became the state's first incorporated city in 1846. Portsmouth developed as a leading clipper-ship port in the early 1800's, and the first railroad opened in 1838. During the 1850's, business leaders built hosiery plants, woolen mills, and factories that made boots and shoes, machine tools, and wood products.

Several people from New Hampshire gained national fame during this period. They included Franklin Pierce, the 14th president of the United States, and Daniel Webster, a leading orator and U.S. senator.

New Hampshire was a leading opponent of slavery. About 34,000 state residents served with the Union forces during the Civil War, and the Portsmouth Naval Shipyard built ships that blockaded Southern ports.

Industrial development increased greatly after the Civil War ended in 1865. The textile, woodworking, and leather industries were among those that grew at record rates. Thousands of French-Canadian and European immigrants came to New Hampshire to fill the labor needs caused by expansion of mills and factories. At the same time, many farmers left the state to claim free land in the West. Farming activity decreased in New Hampshire as industry grew.

The early 1900's. During World War I (1914-1918), the Portsmouth Naval Shipyard built warships. New Hampshire's cotton and woolen textile industries declined in the 1920's and 1930's. Leather and shoe manufacturing became the state's leading industry. New Hampshire improved its highway system during the 1920's, and private utility companies built hydroelectric plants in the state. The Great Depression of the 1930's slowed the growth of the state's economy. Conditions improved after the Depression eased in the late 1930's.

The mid-1900's. During World War II (1939-1945), Portsmouth built submarines and repaired warships, and New Hampshire's textile mills supplied materials for military uniforms. These economic activities helped end depression conditions. In 1944, representatives of 44 na-

The International Monetary Conference was held in 1944 at Bretton Woods. Representatives from 44 nations made plans to restore world trade after World War II. They also drew up the plans for two United Nations agencies—the International Monetary Fund and the World Bank.

tions held the historic International Monetary Conference at Bretton Woods in the White Mountains. They planned postwar world trade and simplified the transfer of money among nations. In addition, they drew up plans for two United Nations agencies—the International Monetary Fund and the World Bank. See **Bretton Woods.**

New Hampshire became increasingly urban and industrial during the mid-1900's. In the 1950's, the state approved the formation of a Business Development Corporation and established an Industrial Park Authority. These two agencies worked to aid new businesses. They also tried to attract industry to New Hampshire.

New Hampshire's once important shoe industry declined sharply because of competition from other states and other countries, especially Italy. But the rapid growth of New Hampshire's electronics industry more than made up for losses in the shoe industry.

In 1961, Alan B. Shepard, Jr., of East Derry became the first American to travel in space. John W. King, a Democrat, served as governor from 1963 to 1969. King was only the third Democrat since 1875 to serve as governor.

In 1963, New Hampshire adopted the first legal lottery in the United States since the 1890's. The lottery is called a *sweepstakes.* The state uses the profits from the sweepstakes to help pay for public education. The first sweepstakes were held in September 1964.

Recent developments. Christa McAuliffe, a Concord high school teacher, was chosen to be the first "ordinary citizen" in space. She was among the seven crew members killed when the space shuttle Challenger broke apart shortly after take-off on Jan. 28, 1986.

New Hampshire today is one of the few states that does not collect a general individual income tax or a general sales tax. This low-tax policy helps attract new industries and other businesses to the state. But low taxes result in less money to pay for state-funded programs and services and for aid to local communities.

During most of the 1980's, New Hampshire experienced economic prosperity and rapid population growth, especially in the southern part of the state. In the late 1980's and early 1990's, however, a national recession resulted in the loss of many jobs, particularly in the areas of real estate, banking, and the defense industry. The state's economy improved in the mid-1990's.

University of New Hampshire

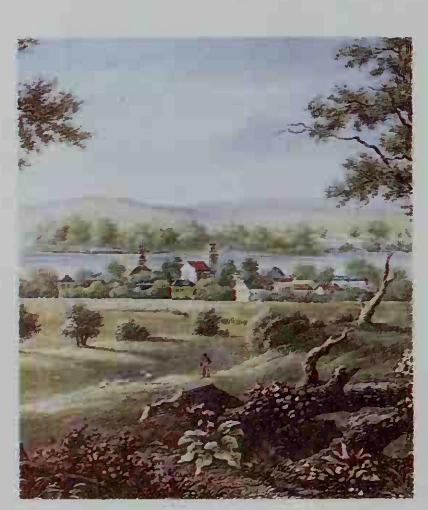
The University of New Hampshire in Durham is part of a state-supported system of higher education. Thompson Hall, *shown here,* serves as the university's administration building.

New Hampshire, University of, is a state-supported coeducational system of higher education. The official name of the system is the University System of New Hampshire. The system includes the main campus of the University of New Hampshire in Durham, another campus in Manchester, state colleges in Keene and Plymouth, and the School for Lifelong Learning, which offers older students degrees at centers throughout New Hampshire.

The Durham campus has colleges of engineering and physical sciences, liberal arts, and life sciences and agriculture. It also has a school of health and human services, a school of business and economics, a graduate school, and a two-year school of applied science. The Durham campus grants bachelor's, master's, and doctor's degrees. The Manchester campus offers bachelor's degrees. The Keene and Plymouth campuses grant bachelor's and master's degrees.

The university was founded in 1866 as the New Hampshire College of Agriculture and Mechanic Arts. It became the University of New Hampshire in 1923.

Critically reviewed by the University System of New Hampshire



New Harmony, Indiana (pop. 916), became famous as an educational and cultural center during the 1820's. Today, this quiet town in Posey County is a trading center for a farming region in the lower Wabash River Valley (see **Indiana** [map]).

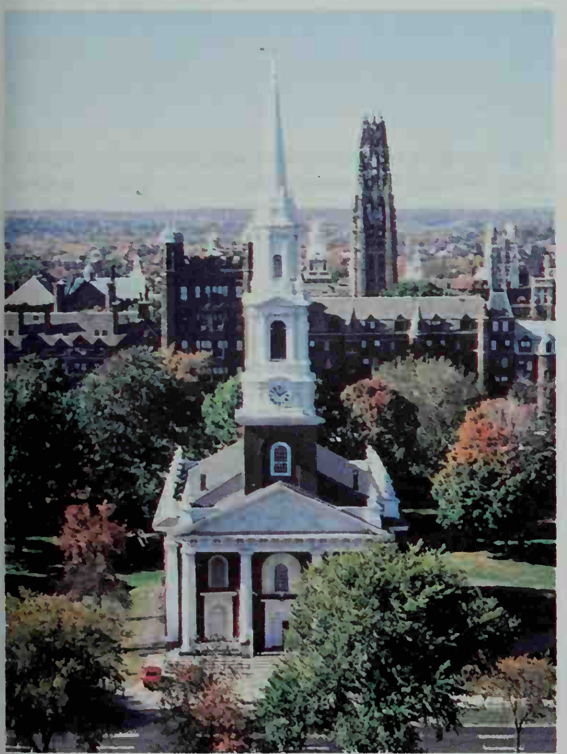
George Rapp (1757-1847), the leader of a religious group called Harmonists, founded the village of Harmonie in 1814. Rapp brought the Harmonists from the kingdom of Württemberg in Germany to escape religious persecution. They spent 10 years in Butler County, Pennsylvania, before migrating to Indiana. The Harmonists were celibate and could not own property. In 1824, Rapp led his followers back to Pennsylvania and founded the village of Economy, which is now called Ambridge. The society died out there near the end of the 1800's.

Robert Owen, a wealthy social reformer and industrialist from Scotland, purchased the Harmonists' Indiana town in 1825. He renamed it New Harmony and attracted new residents with the promise of an earthly *utopia* (perfect society). Owen established a social order based on community ownership and equality of work and profit. His partner was William Maclure, a wealthy

New Harmony, *below,* was a communal society. The restored hedge labyrinth, *right,* was first designed by George Rapp as entertainment.

Granger Collection; Jo Ann Holbrook

scientist from Philadelphia who is sometimes called the "Father of American Geology." In the 1820's, Maclure sent the first seed for the Chinese *golden-rain* trees to Thomas Say, a geologist in New Harmony. These golden-rain, or *gate,* trees now line the streets of the town.



The experiment in community living made New Harmony famous. Scientists and scholars flocked to the town. But few of the 1,000 or more Owenites understood the principles of the experiment, and they split into several factions. By 1827, Owen's plan had failed. New Harmony remained an educational, scientific, and cultural center until the American Civil War (1861-1865). The Minerva Club, the first woman's club to have a constitution and bylaws, was organized at New Harmony in 1859. Some of the buildings erected by the Harmonists and Owenites have been restored. David L. Anderson

See also **Indiana** (Schools; Places to visit); **Owen, Robert; Owen, Robert Dale.**

New Haven (pop. 123,626) is the home of Yale University and the second largest city in Connecticut. Only Bridgeport has a larger population.

The city. A mayor and board of aldermen govern New Haven. The city lies on the northern shore of Long Island Sound (see **Connecticut** [political map]). Its bay is 4 miles (6.4 kilometers) long and 2 miles (3.2 kilometers) wide. Three small rivers, the Mill, Quinnipiac, and West, flow into the bay. At the northern border of the city stand two impressive rock hills—West Rock, rising 670 feet (204 meters), and East Rock, 359 feet (109 meters).

The historic downtown Green lies at the center of New Haven. Three churches built in the 1810's stand along one side of the Green. The Yale campus lies to the north and west of the Green and covers about 175 acres (71 hectares). Offices and City Hall and other government buildings line the other sides of the Green.

F. Byrne Stoddard, Jr.

Center Church, a New Haven landmark dating from the early 1800's, stands on one side of the downtown Green. The tall building in the background is Yale University's Harkness Tower.

A memorial in front of City Hall marks the site of the jail where the black slaves who rebelled on the ship *La Amistad* were held during their trial (see **Amistad Rebellion**). New Haven is now the home port for a life-sized replica of *La Amistad.*

Economy. Yale University and the Southern New England Telephone Company are the city's largest employers. The Knights of Columbus, a Roman Catholic organization that is a major insurance provider, has its national headquarters in New Haven. The city's factories produce car radiators, cardboard boxes, electrical wire, hardware tools, lingerie, and sporting firearms.

Cultural life and recreation. Yale University, founded in 1701, is one of the oldest institutions of higher learning in the United States (see **Yale University**). Other New Haven colleges include Albertus Magnus College and Southern Connecticut State University.

The city's cultural attractions include the Peabody Museum of Natural History, the Eli Whitney Museum, the Yale Center for British Art, the Yale University Art Gallery, and the Beinecke Rare Book and Manuscript Library. New Haven is the home of the Connecticut Chamber Orchestra and the New Haven Symphony Orchestra, one of the oldest symphony orchestras in the nation. The city's theaters include the Long Wharf Theater, the Yale Repertory Theatre, and the Shubert Performing Arts Center. Yale's football team plays in the Yale Bowl.

History. The Quinnipiac Indians originally inhabited the area. Adriaen Block, a Dutch explorer, visited the harbor in 1614. A group of English Puritans led by Theophilus Eaton and John Davenport founded a town there in 1638. At first, they called it *Quinnipiac (Long River Place),* after the original Indian village. In 1640, they changed the town's name to New Haven, after the English city of Newhaven. In 1784, New Haven became a city. Its first mayor was political leader and judge Roger Sherman (see **Sherman, Roger**). New Haven and Hartford were twin capitals of Connecticut from 1701 until 1875, when Hartford became the sole capital.

During the 1700's and early 1800's, New Haven's business centered on its port. During the 1800's, the city became an industrial center. The growth of Yale University also contributed to the area's development. Renewal projects in the late 1900's included the Audubon Arts Center complex and Wooster Square. Once a run-down area, Wooster Square now includes a historic district and commercial and industrial buildings. Stephen Fagin

New Hebrides Islands. See **Vanuatu.**

New Holland. See **Australia** (History).

New Ireland is the second largest of the more than 200 islands of the Bismarck Archipelago, which forms part of the nation of Papua New Guinea. Only New Britain is larger than New Ireland in the island group. New Ireland is about 230 miles (370 kilometers) long and covers about 3,340 square miles (8,651 square kilometers) in the southwest Pacific (see **Papua New Guinea** [map]). It has about 87,000 people. Mountains cover much of the island, and coral reefs surround it.

David A. M. Lea

Camerique from H. Armstrong Roberts

Atlantic City is a world-famous New Jersey resort. Hotels, gambling casinos, restaurants, shops, and beaches line the Atlantic City Boardwalk. New Jersey has many beautiful vacation areas along the Atlantic seaboard that attract millions of visitors to the state each year.

New Jersey *The Garden State*

New Jersey is a state of industrial cities and towns, glistening beaches, and popular summer resorts. It is the fifth smallest state of the United States. Only Hawaii, Connecticut, Delaware, and Rhode Island have a smaller area. But New Jersey ranks ninth in population among the states, and few states manufacture more products or attract more vacationers.

New Jersey is the most densely populated state. All of New Jersey's people live in one of the state's nine metropolitan areas. The state's cities include such busy manufacturing centers as Camden, Elizabeth, Jersey City, Newark, Paterson, and Trenton. However, New Jersey also has many small, quiet towns. A large number of these towns are the homes of people who work in New York City or Philadelphia. Both of these giant cities are neighbors of New Jersey.

The thousands of New Jerseyites who work in New York City and Philadelphia commute daily by train, automobile, or bus. The Holland and Lincoln tunnels and the George Washington Bridge link New Jersey with New York City. Four bridges connect New Jersey with Philadelphia.

The contributors of this article are Paul G. E. Clemens, Professor of History, and Robert M. Hordon, Associate Professor of Geography, both at Rutgers, the State University of New Jersey.

New Jersey's location gives it great economic importance. The state lies between the Hudson and Delaware rivers, and between New York City and Philadelphia. Miles of wharves stretch along the New Jersey side of the Hudson. Ocean liners, freighters, and other ships from all parts of the world dock there and along the Delaware.

Products made in New Jersey are used throughout the United States and in many other parts of the world. They find giant nearby markets in New York City and Philadelphia. New Jersey is one of the leading states in the production of chemical and pharmaceutical products. The state's other leading manufactures include electronics and food products.

Service industries are an important part of the New Jersey economy. Many of the state's workers are employed in such activities as education, health care, and retail trade, especially in northeastern New Jersey.

New Jersey's vacation areas along the Atlantic Coast contrast sharply with the state's industrial cities. More than 50 resort cities and towns, including Atlantic City, Ocean City, and Cape May, line the New Jersey coast. The resort communities provide a wide variety of recreation activities for vacationers. Atlantic City's gambling casinos attract many visitors.

New Jersey and its people have played important roles in United States history. The state earned the nick-

G. Ahrens, H. Armstrong Roberts

A scenic mill stands in Clinton, a rural town in northwestern New Jersey. Despite its small size and large population, the state has many small, quiet towns.

name *Cockpit of the Revolution* because of the many battles fought on its soil during the Revolutionary War. American patriots and British redcoats clashed nearly a hundred times in New Jersey. People compared these actions with cockfights. General George Washington turned the tide of the war at Trenton in 1776 when he led his tattered army across the Delaware River and surprised the enemy. Trenton and Princeton each served as the nation's capital during the 1780's.

In 1884, Grover Cleveland of New Jersey was elected the 22nd President of the United States. He was elected President again in 1892. Woodrow Wilson served as president of Princeton University and governor of New Jersey before he was elected the 28th President in 1912. Wilson was reelected in 1916, and led the nation through World War I.

Three of the world's greatest scientists and inventors worked in New Jersey for many years. Thomas Edison invented the electric light and the phonograph in his laboratory in Menlo Park. Samuel F. B. Morse developed the first successful U.S. electric telegraph near Morristown. Albert Einstein worked many years at the Institute for Advanced Study in Princeton.

New Jersey's many truck farms, orchards, and flower gardens give it the nickname of the *Garden State*. Trenton is the capital of New Jersey and Newark is the largest city in the state.

Interesting facts about New Jersey

WORLD BOOK illustrations by Kevin Chadwick

The first drive-in motion picture theater was opened on June 6, 1933, on Crescent Boulevard outside Camden. The theater presented two shows each night on a 40 by 50 foot (12 by 15 meter) screen. Inclined rows at the theater accommodated 500 cars. Richard Hollingshead, Jr., the owner of the theater, originated the idea for the drive-in.

First drive-in theater

A huge clock in a riverfront park in Jersey City can be read from across the Hudson River in New York City. The clock, which came from the old Colgate-Palmolive building, is 50 feet (15 meters) across. The minute hand, about 26 feet (8 meters) long, moves 1 mile (1.6 kilometers) every 34 hours 4 minutes.

Colgate-Palmolive clock

The first electric sewing machine was made in 1889 by the Singer Manufacturing Company at its factory in Elizabethport (now Elizabeth).

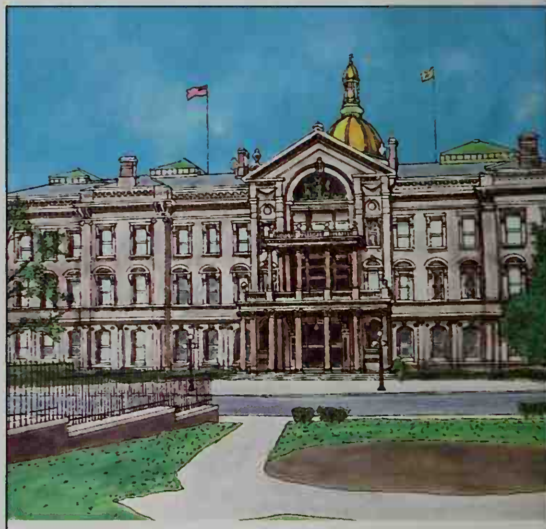
Newark, New Jersey's largest city, is the center of a large industrial area in the northeastern part of the state. Newark ranks as one of the nation's leading manufacturing centers.

New Jersey in brief

Symbols of New Jersey

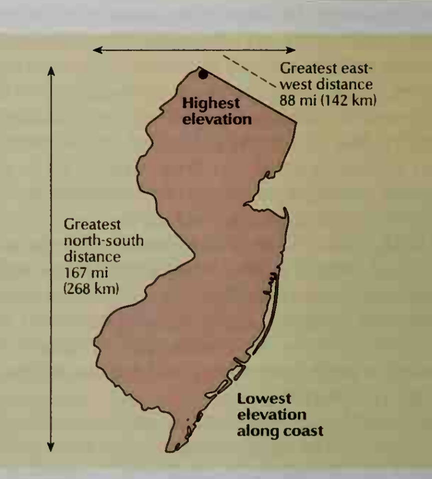
The state flag, adopted in 1896, bears a version of the state seal. On the seal, adopted in 1928, three plows on a shield represent agriculture. A helmet symbolizing sovereignty and a crest with a horse's head appear above the shield. Supporting the shield are Liberty, left, and Ceres, right, the Roman goddess of grain and a symbol of abundance.



State flag

State seal

New Jersey (brown) ranks 46th in size among all the states and is the smallest of the Middle Atlantic States (yellow).



The State Capitol is in Trenton, the capital since 1790. Perth Amboy and Burlington served as twin capitals from 1703 to 1775. There was no definite capital from 1775 to 1790.

General information

Statehood: Dec. 18, 1787, the third state.
State abbreviations: N.J. (traditional); NJ (postal).
State motto: *Liberty and Prosperity.*
State song: none.

Land and climate

Area: 7,790 mi² (20,175 km²), including 371 mi² (960 km²) of inland water but excluding 425 mi² (1,102 km²) of coastal water.
Elevation: *Highest*—High Point, 1,803 ft (550 m) above sea level. *Lowest*—sea level along the Atlantic Ocean.
Coastline: 130 mi (209 km).
Record high temperature: 110 °F (43 °C) at Runyon on July 10, 1936.
Record low temperature: −34 °F (−37 °C) at River Vale on Jan. 5, 1904.
Average July temperature: 75 °F (24 °C).
Average January temperature: 31 °F (−1 °C).
Average yearly precipitation: 45 in (114 cm).

Important dates

1524 Giovanni da Verrazzano explored the New Jersey coast.

1660 The Dutch established a permanent settlement at Bergen (now part of Jersey City).

1776 New Jersey adopted its first constitution.

1787 New Jersey became the 3rd state when it ratified the U.S. Constitution on December 18.

Sources of information

For information about tourism, write to: the New Jersey Commerce and Economic Growth Commission, Office of Travel and Tourism, 20 W. State Street, P.O. Box 820, Trenton, NJ 08625-0820. The Web site at www.state.nj.us/travel also provides information.
For information on the economy, write to: New Jersey Council of Economic Advisors, P.O. Box 269, Trenton, NJ 08695-0269.
The state's official Web site at www.state.nj.us also provides a gateway to much information on New Jersey's economy, government, and history.

1858 e first dinosaur skeleton discovered in North nerica was found buried in Haddonfield.

1879 Thomas A. Edison invented the electric light in Menlo Park.

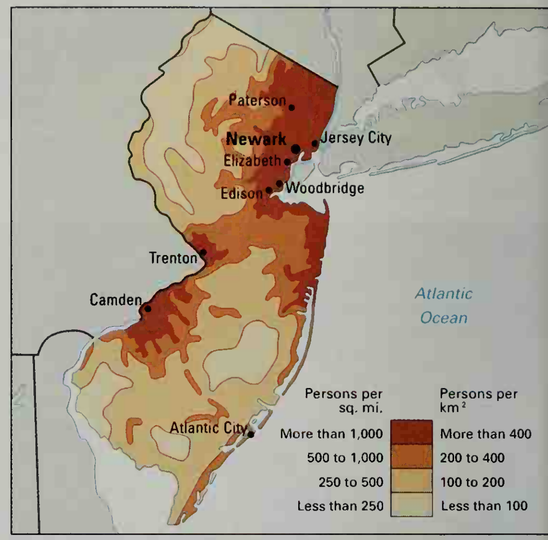
1969 The state's voters approved a lottery to raise money for state government and for education.

1978 Casino gambling began in Atlantic City.

1987 New Jersey celebrated the bicentennial of its statehood.

People

Population. The 2000 United States census reported that New Jersey had 8,414,350 people. The population of New Jersey had increased 9 percent over the 1990 census figure, 7,730,188. According to the 2000 United States census, New Jersey ranks ninth in population among the 50 states.



All of the people in New Jersey live in metropolitan areas (see **Metropolitan area**). Nine metropolitan areas lie either partly or entirely in New Jersey. The metropolitan areas are Atlantic-Cape May, Bergen-Passaic, Jersey City, Middlesex-Somerset-Hunterdon, Monmouth-Ocean, Newark, Philadelphia (Pennsylvania), Trenton, and Vineland-Milleville-Bridgeton. For the populations of these metropolitan areas, see the *Index* to the political map of New Jersey.

Six metropolitan areas in the northern part of New Jersey, together with four metropolitan areas in New York and five in southwestern Connecticut make up a consolidated metropolitan area. The New York-Northern New Jersey-Long Island Consolidated Metropolitan Statistical Area has a population of about 21 million.

Newark is New Jersey's largest city, with a population of about 274,000. The state's other cities with more than 75,000 people, in order of population, include Jersey City; Paterson; Elizabeth; Trenton, the state capital; and Camden.

Population density

New Jersey is the most densely populated state. A majority of its people live in the northeast. The most thinly populated areas are in the northwest and the south.

WORLD BOOK map; based on U.S. Census Bureau data.

Workers harvest cranberries from a bog near Chatsworth. New Jersey ranks as a leading cranberry-growing state. Farmers there also grow blueberries and peaches.

© J. T. Miller, The Stock Market

A roadside farmstand in Belle Mead sells flowers and produce. New Jersey's many truck farms, flower gardens, and orchards earn it the nickname the *Garden State.*

R. Krubner, H. Armstrong Roberts

The Cape May Mall has many quaint shops and restaurants. Cape May, one of New Jersey's most popular seaside resorts, is located at the southern tip of the state.

Princeton University, founded in 1746, is the fourth-oldest institution of higher learning in the United States. The Firestone Library in the background is one of the many beautiful buildings on the campus.

Michael J. Beanan, Princeton University

New Jersey's largest population groups include people of Italian, Irish, German, and English descent. About 14 out of every 100 of New Jersey's people are African Americans. Hispanic Americans account for about 13 percent of the population, while Asians make up about 6 percent.

Schools. Colonial New Jersey had no public schools. Children attended school only if their parents could pay tuition. A public school system began in 1817, when the Legislature established a permanent school fund.

A state commissioner of education and a 13-member State Board of Education direct the state's public school system. The governor, with the Senate's approval, appoints the board members to six-year terms. The governor appoints the commissioner to a term that coincides with his or her own. The Legislature is responsible for education, but it delegates administrative responsibilities to local school boards. The Commission on Higher Education directs New Jersey's public college system.

New Jersey law requires children from age 6 through 15 to attend school. For the number of students and teachers in New Jersey, see **Education** (table).

Two of the oldest U.S. universities and colleges are in New Jersey. They are Princeton University (1746) and Rutgers, the State University of New Jersey (1766).

Libraries. Thomas Cadwalader founded New Jersey's first public library at Trenton in 1750. The State Library in Trenton has large law and general reference collections that serve state government officials and are open to the public. The New Jersey Library Network includes many member libraries of all types, organized into regions. Member libraries can call on major libraries in each region for reference and interlibrary loan services. Libraries at Princeton and Rutgers universities have the largest collections among the state's colleges. The Harvey S. Firestone Memorial Library of Princeton University is New Jersey's largest research library.

Museums. The New Jersey State Museum in Trenton features archaeology, decorative arts, fine arts, and natural history exhibits. It includes an auditorium, exhibition halls, and a planetarium. The Newark Museum includes a planetarium and art, science, and natural history exhibits. The Liberty Science Center in Jersey City features exhibits on inventions and health. The Montclair Art Museum and Princeton University Art Museum display excellent collections of paintings and sculpture.

Universities and colleges

Visitor's guide

New Jersey is one of the great coastal playgrounds of the United States. Every year, millions of vacationers flock to the state's seaside resorts. They swim in the Atlantic Ocean, sunbathe on sandy beaches, and stroll along boardwalks lined with shops and museums. Visitors also enjoy many historic sites in the state.

New Jersey attracts many people who enjoy outdoor sports. They can catch game fish in the ocean or cast for trout in stocked streams. Hunters shoot ducks in coastal areas, and deer, pheasants, and rabbits on inland shooting grounds. Sailing is popular in the coastal bays. The state also has fine ski areas and golf courses.

The Miss America Pageant, held each September or October in Atlantic City's Convention Center, is New Jersey's best-known annual event. This nationally televised pageant features women from every state.

Vincent Abbatiello, Rutgers University

Rutgers University Trial Gardens in New Brunswick

Places to visit

Following are brief descriptions of some of New Jersey's many interesting places to visit:

Barnegat Lighthouse, near Barnegat Light, is a favorite subject of painters and photographers. The lighthouse is part of a state park that also includes a museum and a sandy beach.

Delaware Water Gap is a deep narrow gorge formed where the Delaware River cuts through the Kittatinny Mountains. This scenic gap separates New Jersey and Pennsylvania north of Columbia, New Jersey, and forms part of the Delaware Water Gap National Recreation Area.

Monmouth Battlefield State Park, near Freehold, is the site of the Battle of Monmouth, the last major battle in the North during the Revolutionary War in America (1775-1783).

New Jersey State Aquarium, in Camden, features a tank with many kinds of fish, a seal pool, and a trout stream.

Princeton is the home of Princeton University and Princeton Battlefield, the site of an important colonial victory in the Revolutionary War in America. The university's Nassau Hall served as the U.S. Capitol in 1783.

Seaside resorts include Cape May, Ocean City, Seaside Heights, and the Wildwoods. Atlantic City's boardwalk was the first built in the United States. In addition, the resort has a convention center for major events. Many visitors are attracted by Atlantic City's gambling casinos. Cape May, the oldest resort in the United States, has over 250 Victorian buildings.

Trenton has many points of interest, including the New Jersey State Museum, the State Capitol, and the Old Barracks, used by British soldiers during the French and Indian wars (1689-1763) and by the Hessians at the Battle of Trenton (1776).

Waterloo Village, in Stanhope, is a restored village of the 1700's. The village includes a grist mill, blacksmith shops, and many furnished homes.

National park and historic site. Morristown National Historical Park, established in 1933, lies in and near Morristown. It includes Ford Mansion, George Washington's headquarters during the winter of 1779-1780; Fort Nonsense, a restoration of a fort built in 1777; and several camps used by American soldiers during the Revolutionary War. See **National Park System** (table: National historical parks). The Edison National Historic Site in West Orange includes Thomas A. Edison's home, laboratories, library, and models of his inventions.

State parks and forests. New Jersey has 40 state parks and 11 state forests. Liberty State Park, near the Statue of Liberty and Ellis Island, offers an excellent view of New York City's skyline. The park also has a science museum with interactive exhibits. For information on New Jersey's state parks, write to Division of Parks and Forestry, P.O. Box 404, Trenton, NJ 08625. New Jersey and New York together maintain Palisades Interstate Park.

Annual events

January-March
Super Science Weekend in Trenton (January); Classic Car Auction, Flea Market, and Antique Show in Atlantic City (February); Sail Expo in Atlantic City (February and March).

April-July
Annual Shad Festival in Lambertville (April); Cherry Blossom Display in Newark (April); Annual Battle of Monmouth in Manalapan (June); First Union Bicycle Race in Trenton (early June); New Jersey Seafood Festival in Belmar (June); Opera Festival in Princeton (June-July); Pathmark Women's Professional Tennis Classic in Mahwah (July); New Jersey Offshore Grand Prix Ocean Races in Point Pleasant (July); New Jersey Shuffleboard Championships in Ocean City (July); Whitesbog Blueberry Festival in Browns Mills (July); New Jersey Festival of Ballooning in Readington (July).

August-September
Hummingbird Extravaganza in Swainton (August); Sussex Country Farm and Horse Show in Sussex (August); Baby Parades in Avalon, Ocean City, Sea Isle City, and Wildwood (August); Miss America Pageant in Atlantic City (September or October).

October-December
Victorian Week in Cape May (October); Cranberry Festival in Chatsworth (October); Grand Christmas Exhibition in Wheaton Village (November and December); Reenactment of Washington's Crossing of the Delaware in Titusville (December 25); Victorian Christmas Celebration in Cape May (December).

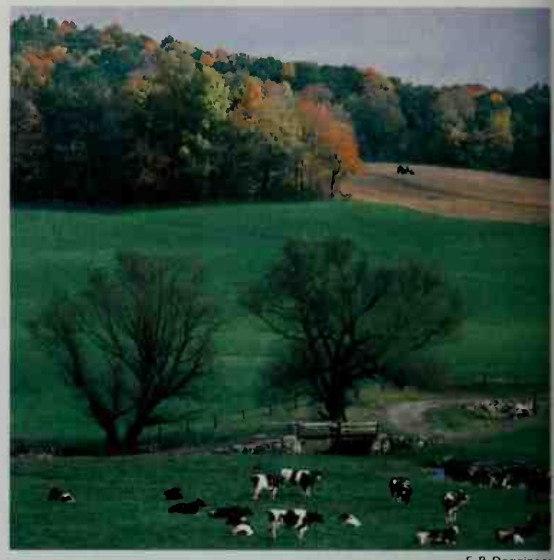
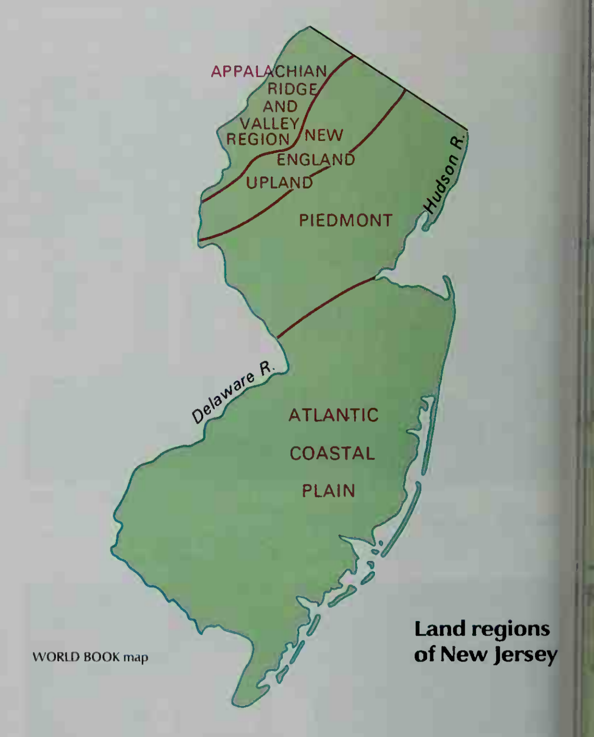
Land and climate



Land regions. New Jersey has four main land regions. They are, from northwest to southeast: (1) the Appalachian Ridge and Valley Region, (2) the New England Upland, (3) the Piedmont, and (4) the Atlantic Coastal Plain.

The Appalachian Ridge and Valley Region is a mountainous area in the northwestern corner of the state. It is part of a large region of the same name that runs from New York to Alabama. In New Jersey, it includes the Kittatinny Mountains and several valleys. The Kittatinny Mountains run parallel to New Jersey's northwestern border. The Delaware Water Gap, which is formed where the Delaware River cuts through the mountains, is one of the most scenic areas in the East. The Appalachian Valley lies southeast of the Kittatinny Mountains. This wide valley is part of the larger Great Valley. Shale and limestone formations lie in various parts of the Appalachian Valley. Herds of dairy cattle graze on grassy slopes in the valley, and farmers there raise apples and vegetables.

The New England Upland, usually called the *Highlands,* lies southeast of the Appalachian Ridge and Valley Region. The region extends into New York and Pennsylvania. Flat-topped ridges of hard rock, called *gneiss,* cover much of the New England Upland in New Jersey. Many lakes nestle among the ridges of the New England Upland in New Jersey. These lakes are among the state's most important tourist attractions.



The Piedmont crosses northern New Jersey in a belt 20 miles (32 kilometers) wide southeast of the New England Upland. The Piedmont covers an area from New York to Alabama. It covers only about a fifth of New Jersey, but about three-fifths of the state's people live there. The region includes such large industrial cities as Elizabeth, Jersey City, Newark, and Paterson. The cities of the Piedmont region owe much of their industrial importance to the many large rivers in the area. These rivers include the Hudson, the Passaic, the Ramapo, and the Raritan.

The Atlantic Coastal Plain is a gently-rolling lowland that covers the southern three-fifths of New Jersey. It is part of a plain with the same name that stretches from New York to Florida. In New Jersey, more than half the plain lies less than 100 feet (30 meters) above sea level. In the west and southwest, fertile soil supports many truck farms. Camden, Trenton, and other cities lie along the wide Delaware River in the western part of the plain. To the east, pine forests and salt marshes cover much of the Atlantic Coastal Plain. For this reason, large areas of the region are thinly populated. Salt marshes, shallow lagoons, and meadows lie near New Jersey's Atlantic coast. Over 50 resort cities and towns, including Atlantic City, Ocean City, and Cape May, lie on the eastern edge of the Atlantic Coastal Plain.

E. R. Degginger

A herd of dairy cattle grazes on a pasture in the Appalachian Ridge and Valley Region of northwestern New Jersey. This area includes the Kittatinny Mountains and several valleys.

Specially created for *The World Book Encyclopedia* by Rand McNally and World Book editors

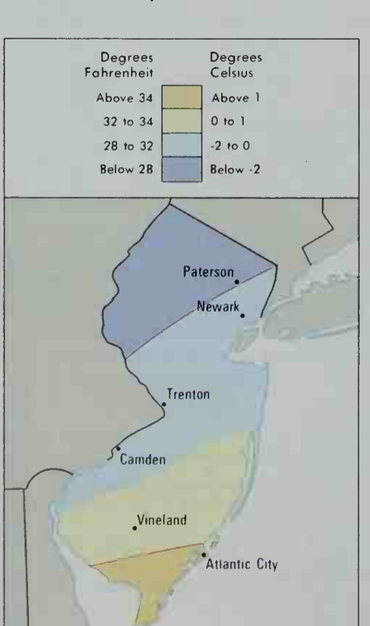
Coastline. A long, narrow sandbar makes up most of New Jersey's 130-mile (209-kilometer) coastline. Many inlets break the coast and lead to bays between the sandbar and the mainland. New Jersey's coastal bays include, from south to north, Great Egg Bay, Great Bay, Little Egg Harbor, Barnegat Bay, Sandy Hook Bay, Raritan Bay, and Newark Bay.

Mountains. New Jersey's most mountainous area is in the northwest. High Point, the state's highest peak, has an elevation of 1,803 feet (550 meters). It is in the Kittatinny Mountains in the Appalachian Ridge and Valley Region. The New Jersey Highlands, in the New England Upland Region, has mountains averaging more than 1,000 feet (305 meters). Other ranges in New Jersey include the Sourland and Watchung mountains, which generally rise about 450 feet (137 meters) in the Piedmont Region.

Rivers and lakes. New Jersey's most important rivers are the Delaware and the Hudson. The Delaware forms the state's western border and empties into Delaware Bay. The Hudson separates New Jersey and New York in the northeast and flows into the Atlantic Ocean. The Raritan is the longest river entirely within New Jersey. It flows about 75 miles (121 kilometers) through the north. Other important rivers in the north include the Hackensack, Millstone, Musconetcong, and Passaic. Southern New Jersey rivers include Great Egg Harbor, Maurice, Mullica, and Toms.

New Jersey has more than 800 lakes and ponds, mostly in the north. Lake Hopatcong is the state's largest lake. Other large lakes include Budd, Culvers, Green Pond, Greenwood (partly in New York), Lake Mohawk, and Swartswood.

Plant and animal life. Forests cover about two-fifths of New Jersey. Beech, birch, maple, oak, sweet gums, yellow poplar, and other hardwoods are the most valuable trees in the northern part of the state. Important trees of southern New Jersey include cedar, pitch pine, and short-leaf pine. The purple violet, the state flower, grows in wooded areas throughout the state. Honeysuckle, goldenrod, and Queen Anne's lace grow in many areas. Other flowers found in New Jersey include azaleas, buttercups, mountain laurels, rhododendrons, and Virginia cowslips.



The state's animals include deer, foxes, minks, muskrats, opossums, otters, rabbits, raccoons, and skunks. Wild ducks and geese are found along the marshy

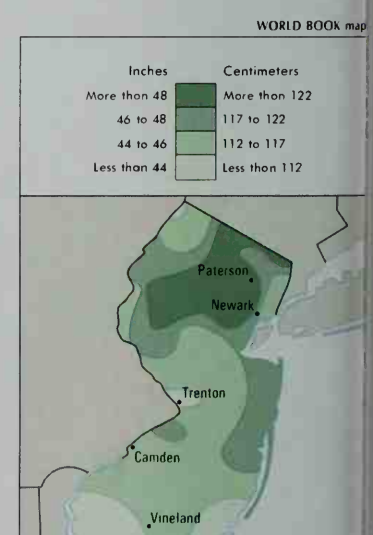
Average January temperatures

New Jersey has cold winters. Temperatures are coldest in the north and mildest in the southern tip of the state.

Average July temperatures



Breezes from the Atlantic Ocean cool the coast in summer. The western part of the state has the hottest temperatures.

Average yearly precipitation

New Jersey has a fairly even amount of precipitation, but the north gets much more annual snowfall than the south.

WORLD BOOK map

shores of the Atlantic Ocean. Game birds of the meadows and woodlands include partridges, pheasants, quail, ruffed grouse, and wild turkeys.

Clams, crabs, lobsters, menhaden, and oysters live in New Jersey's coastal waters. The state's bays and streams abound with bass, bluefish, crappies, pickerel, pike, salmon, shad, sturgeon, trout, and weakfish.

Climate. New Jersey has warm to hot summers and cold winters. Ocean breezes reduce summer temperatures and increase winter temperatures in a narrow strip along the eastern coast. Average July temperatures range from 76 °F (24 °C) in the southwest to 70 °F (21 °C) in the north. On July 10, 1936, Runyon had the state's highest temperature, 110 °F (43 °C). Average January temperatures range from 34 °F (1 °C) at Cape May to 26 °F (−3 °C) in the Appalachian Ridge and Valley Region. On Jan. 5, 1904, River Vale had the state's lowest temperature, −34 °F (−37 °C).

Snowfall averages about 13 inches (33 centimeters) a year in the south, and 50 inches (127 centimeters) in the north. New Jersey averages about 45 inches (114 centimeters) of *precipitation* (rain, melted snow, and other forms of moisture) a year. Precipitation is fairly evenly distributed throughout the state.

E. R. Degginger

A salt marsh near Brigantine forms part of the Atlantic Coastal Plain region of New Jersey. This gently rolling lowland covers the southern three-fifths of the state.

Economy

Despite its small size, New Jersey ranks among the leading industrial states. Most of the state's factories are in the Elizabeth-Jersey City-Newark area and in the Trenton-Camden area. Service industries have become the pillar of New Jersey's economy. Most of these industries are concentrated in the state's metropolitan areas.

The 127-mile (204-kilometer) long, beach-lined Atlantic seaboard is the center of New Jersey's tourist trade. Tourist activities in the state account for about $28 billion a year. New Jersey's proximity to New York City and Philadelphia helps the state's economy. These cities provide large markets for goods and services produced within New Jersey.

Natural resources of New Jersey include fertile soils and small deposits of minerals. Unlike many other states, New Jersey does not rely on its own resources for the raw materials of its industries.

Soil. Three types of soil are most common in New Jersey. In the north, the soil has a high limestone and glacial mineral content. Farmers in this region raise field crops and operate dairy farms. A rich subsoil of greensand marl lies under rich loam in central New Jersey. This mixture yields good vegetable crops. When mixed with fertilizer, the sandy soil of the south supports fruit orchards and vegetable farms.

Minerals. Stone—especially granite and traprock—is New Jersey's most abundant mined resource. Northern and central New Jersey produce almost all the stone in the state. Sand and gravel are found throughout New Jersey. Camden, Middlesex, Morris, and Ocean counties produce sand and gravel for construction. Cumberland County produces a large amount of industrial sand for glassmaking and foundry work. Other mined resources include clay, gemstones, greensand marl, peat, and zinc.

Service industries account for the largest part of New Jersey's *gross state product*—the total value of all goods and services produced in a state in a year.

New Jersey's leading service industries are (1) community, business, and personal services and (2) finance, insurance, and real estate. Each of these groups contributes an equal share to the gross state product.

Community, business, and personal services include such businesses as private health care, hotels and casinos, and private research laboratories. Atlantic City has many hotels and casinos. Business services include computer programming, management consulting, and temporary help. One of the world's most famous private research complexes, Bell Laboratories, is near New

Production and workers by economic activities

Nabisco Brands, Inc.

Cookies are inspected at a factory in Fair Lawn. Food processing ranks as New Jersey's third most important manufacturing activity. New Jersey is a leading food-processing state.

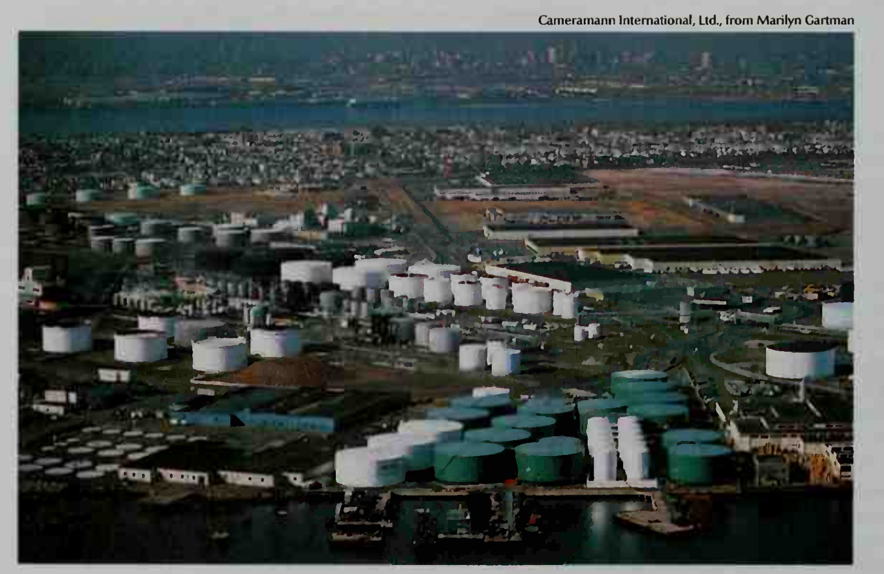
Providence. Now part of Lucent Technologies Inc., Bell Laboratories was formerly operated by AT&T Corp.

Northern New Jersey is one of the nation's leading centers of commercial real estate, which includes office buildings and factories. The largest U.S. life insurance company, Prudential, is headquartered in Newark.

Wholesale and retail trade ranks next among New Jersey's service industries. Northern New Jersey is one of the country's leading centers for the wholesale trade of chemicals and machinery. The Newark-Elizabethtown port is a major U.S. port for international trade. The Newark and Bergen-Passaic areas lead in retail trade, which includes discount stores and service stations.

Other service industries include (1) government and (2) transportation, communication, and utilities. Government services include military activities and the operation of public schools and hospitals. Many people are employed by New Jersey's public school system. Two major United States utility companies, Public Service Enterprise Group and GPU Energy, are based in New Jersey. Information about transportation and communication in the state appears later in this section.

Manufacturing. Goods manufactured in New Jersey have a *value added by manufacture* of about $48 billion a year. Value added by manufacture represents the increase in value of raw materials after they become finished products. New Jersey ranks among the leading states in manufacturing and processing. Many foreign manufacturers operate factories in New Jersey.



New Jersey is one of the leading states in chemical production, and chemicals rank as New Jersey's leading manufactured product. Pharmaceuticals are the most valuable types of chemicals made in the state. Several major pharmaceutical companies—American Home Products, Aventis Pharma, Johnson & Johnson, Merck, Pharmacia, and Schering-Plough—have their world headquarters in New Jersey. Shampoo, lotion, perfume, and other personal care products also make up an important part of New Jersey's chemical industry. Other chemical products made in New Jersey include detergents, industrial chemicals, paint, and plastics resins.

Computer and electronic products rank second in terms of value added by manufacture. The state's electronic manufactures include wireless and broadcast communications equipment, electronic components, and surveillance and navigation equipment.

Food products rank third among New Jersey's manufactured products. Factories in northeastern New Jersey process a wide variety of foods, including bakery products, beverages, fruits, meats, roasted coffee, sugar and confectionery products, and vegetables. Food-processing plants in southwestern New Jersey process and can fruits and vegetables brought in from nearby truck gardens and orchards.

Other products manufactured in New Jersey include fabricated metal products, plastics and rubber products, printed materials, and machinery. Fabricated metal products made in New Jersey include metal cans, pipe fittings, and nails and screws. The state's plastics products include bags, sheets, and bottles. The major types

Cameramann International, Ltd., from Marilyn Gartman

A chemical plant in Bayonne is one of about 1,000 such facilities in New Jersey. The production of chemicals is the state's leading manufacturing activity.

of printed materials produced in New Jersey are business forms, books, and newspapers. Types of machinery made in New Jersey include metalworking machinery, papermaking machinery, and refrigeration equipment.

Agriculture. Farmland covers nearly 20 percent of New Jersey's land area. The state has about 9,600 farms.

Greenhouse and nursery products are New Jersey's most valuable source of agricultural income. These products are raised chiefly in the northeastern part of New Jersey for sale in the New York City area. Millions of roses are grown in the state yearly. New Jersey greenhouses also raise chrysanthemums, geraniums, lilies, orchids, and poinsettias. The state's leading nursery products include grass sod and such ornamental shrubs as arborvitae, holly, and juniper.

Milk is the second most valuable source of farm income in New Jersey. Dairy farms flourish in the northwestern part of the state, especially in Hunterdon, Sussex, and Warren counties. Burlington and Salem counties in southern New Jersey also rank high in milk production.

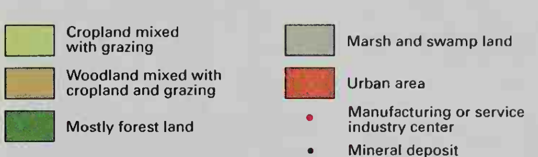
New Jersey is also an important vegetable-growing state. The state is one of the nation's leading producers of asparagus, bell peppers, eggplant, endive, lettuce, and spinach. New Jersey farmers also raise cabbage, snap beans, and sweet corn. The largest vegetable farms are in the southern half of the state.

Blueberries and cranberries are the most valuable fruit crops grown in the state. New Jersey ranks among the leading states in the production of these fruits. The state also ranks high in the production of apples, peaches, and strawberries. Most of New Jersey's fruit orchards are in the southern third of the state. Warren County, in northwestern New Jersey, is a major producer of apples.

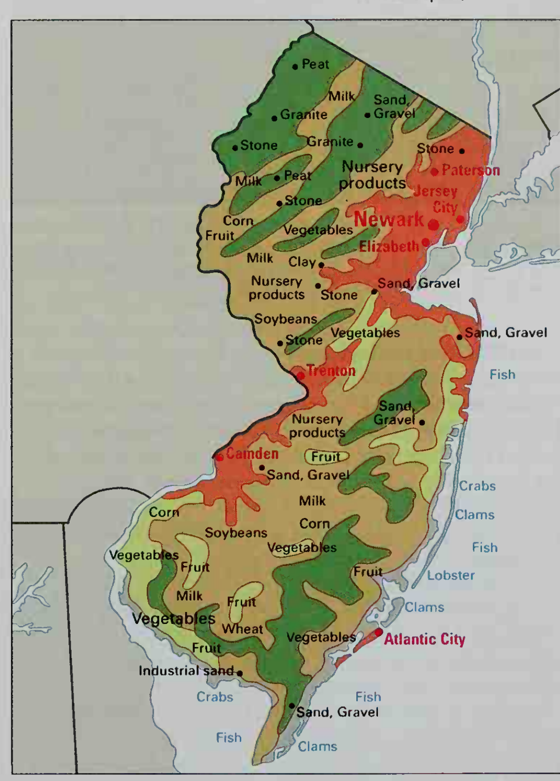
Soybeans, corn, and wheat are New Jersey's chief field crops. Soybeans and wheat are grown primarily in the southernmost counties. Corn is grown mainly in New Jersey's northwestern and southwestern counties.

Mining. The most important products mined in New Jersey are crushed stone, and sand and gravel. The most valuable types of crushed stone quarried in the state are traprock and granite. Most of the traprock comes from Somerset and Mercer counties. Granite comes from Morris and Sussex counties. Sand and gravel are mined mainly in coastal areas. The state's other mined products include clays, greensand marl, and peat.

Fishing industry. New Jersey's commercial fish catch has an annual value of about $100 million. The state is a leader in the value of clams caught. Huge clam beds extend from Barnegat Bay to Cape May. The fish catch also includes blue crab, flounder, lobster, mackerel, menhaden, porgies, scallops, squid, swordfish, and whiting.



Electric power. Nuclear power plants provide about 75 percent of New Jersey's electric power. Coal-burning plants provide about 15 percent of the state's electric power. Plants that burn natural gas supply most of the remaining power. Petroleum-burning plants produce a small amount of the state's electric power.

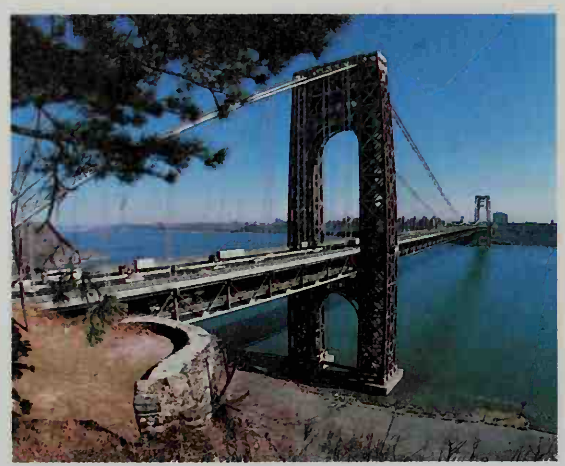


Transportation. New Jersey lies between New York City and the western and southern states. This location makes its highways and railroads important links in the nation's transportation system. New Jersey is a leader in *containerization* (transporting goods by containers along a network of airplanes, ships, trains, and trucks).

Passenger trains connect many New Jersey cities with New York City and Philadelphia. These trains include swift commuter lines that carry thousands of New Jerseyites to jobs in these two large cities. Several railroad lines provide freight service in New Jersey.

Economy of New Jersey

This map shows the economic uses of land in New Jersey and where the state's leading farm and mineral products are produced. Major manufacturing centers are shown in red.



WORLD BOOK map

E. R. Degginger

Farmworkers plant lettuce on a New Jersey truck farm. Such farms supply vegetables for people in nearby cities. New Jersey is an important vegetable-growing state.

Cameramann International, Ltd. from Marilyn Gartman

The George Washington Bridge spans the Hudson River from Fort Lee to New York City. Thousands of commuters who live in New Jersey and work in New York City use it daily.

In 1891, New Jersey became the first state to help local communities build roads. New Jersey now has about 35,000 miles (56,000 kilometers) of roads and highways. The New Jersey Turnpike is 122 miles (196 kilometers) long. It runs from Deepwater in the southwest part of the state to Ridgefield Park in the northeast. The turnpike was opened in 1952 and was extended in 1956. It is 12 lanes wide in some areas, making it one of the widest highways in the United States. More than 200 million vehicles travel the turnpike each year. The 173-mile (278-kilometer) Garden State Parkway crosses New Jersey between the New York state line near Montvale and Cape May, at New Jersey's southern tip. The Garden State Parkway was completed in 1957.

Bridges and tunnels link New Jersey and neighboring states. The George Washington Bridge, which is one of the world's longest suspension bridges, spans the Hudson River between Fort Lee and New York City. The Bayonne Bridge, which is one of the longest steel arch bridges in the world, crosses Kill Van Kull, a channel between Bayonne and Staten Island. Bridges across the Delaware River include the Benjamin Franklin Bridge between Camden and Philadelphia and the Delaware Memorial Bridge Twin Span between Deepwater and the New Castle, Delaware, area. The Holland and Lincoln auto tunnels and the PATH tubes—four rapid transit tunnels—link New Jersey and New York City. All of these tunnels run beneath the Hudson River.

Newark International Airport is one of the country's busiest airports. It serves many passengers going to or from New York City as well as those headed to or from northeastern New Jersey. The first regular air passenger service in the United States began operating in 1919 between Atlantic City and New York City.

New Jersey has a number of important ports along the Hudson and Delaware rivers, in Newark and Raritan Bay, and along Kill Van Kull and Arthur Kill. New Jersey's part of the Atlantic Intracoastal Waterway extends for 117 miles (188 kilometers) from Manasquan Inlet to Cape May. This waterway is protected from the ocean by barrier beaches, and thus offers safe passage for small boats.

Communication. About 245 newspapers, including about 20 dailies, are published in New Jersey. The leading papers include the *Courier-Post* of Cherry Hill, the *Star-Ledger* of Newark, *The Press of Atlantic City, The Record* of Hackensack, and *The Times* of Trenton. New York City and Philadelphia newspapers have wide circulation in New Jersey. The state's first weekly newspaper, the *New Jersey Gazette,* began publishing in Burlington in 1777. New Jersey's first daily newspaper, the *Newark Daily Advertiser,* was founded in 1832. Nearly 450 periodicals are published in the state.

New Jersey has about 85 radio stations and 10 television stations. Cable TV systems and Internet providers also serve communities statewide. Many pioneer efforts in radio broadcasting took place in New Jersey. Joseph Henry transmitted the first radio impulse at Princeton in 1840. WJZ, the second licensed commercial broadcasting station in the country, was established in Newark in 1921. This station now operates in New York City under the call letters WPLJ The first New Jersey television station, WATV, began operating in Newark in 1948. It is now WNET of New York City. Today, only *UHF* (ultrahigh frequency) commercial stations broadcast in New Jersey. The state created the New Jersey Public Broadcasting Authority in 1969. The authority operates a four-station UHF statewide public television system. New York and Pennsylvania stations also serve New Jersey.

New Jersey boasts many other "firsts" in communication. The first interstate long-distance telephone call was made from New Brunswick, New Jersey, to New York City in 1877. The first coast-to-coast direct dialing system was established in Englewood in 1951. Telstar 1, the first communications satellite to transmit live television across the Atlantic, was designed at New Jersey's Bell Laboratories. The satellite was launched in 1962.

Government

Constitution of New Jersey was adopted in 1947. New Jersey had two earlier constitutions, adopted in 1776 and 1844. Either house of the state Legislature may propose constitutional amendments. Amendments must be approved by three-fifths of the members of both houses, or by a majority vote of both houses in two successive years. To become law, amendments must also be approved by a majority of the voters in a general election. The Constitution does not provide for a constitutional convention that can amend the Constitution.

Executive. The governor is the only New Jersey executive official elected by the people. The governor may serve any number of terms, but not more than two in succession.

The governor is responsible for appointing most of the high-level executive officials of New Jersey's government. These officials include the attorney general; secretary of state; state treasurer; and the commissioners of banking and insurance, personnel, community affairs, education, environmental protection, health and senior

services, and labor. The state Board of Agriculture appoints the secretary of agriculture. Board members are recommended by an agricultural convention and appointed by the governor. All the governor's appointments must be approved by the state Senate. Most executive officials serve four-year terms.

Legislature of New Jersey consists of a 40-member Senate and an 80-member General Assembly. Voters in each of the state's 40 legislative districts elect one senator and two members of the Assembly. Senate terms are on 10-year cycles of two, four, and four years. Senators are elected to a two-year term in the election after each U.S. population census. The next two terms are each for four years. Members of the Assembly are elected to two-year terms. The New Jersey legislature meets annually, beginning on the second Tuesday of January. Legislative sessions have no time limit.

Courts. New Jersey's highest court, the state Supreme Court, hears cases involving constitutional problems, capital punishment, and other major matters. The Supreme Court has a chief justice and six associate justices. The state Superior Court is New Jersey's chief trial court. It has three divisions—Appellate, Law, and Chancery. The Superior Court has 362 judges. The governor, with the Senate's approval, appoints both the members of the Supreme and Superior courts to seven-year terms. If the governor reappoints them once, the judges may serve until they are 70 years old.

Lower courts include municipal courts, surrogate courts, and tax courts. The governor of New Jersey, with the Senate's approval, appoints all lower court judges except those of the single-municipal courts. Judges of single-municipal courts are appointed by local governments. New Jersey voters elect surrogate judges.

Local government. New Jersey is the only state in which county governments are called *boards of chosen freeholders.* This name comes from colonial days, when only *freeholders* (property owners) could hold public office. All 21 New Jersey counties have boards of from three to nine members. All freeholders in New Jersey's 21 counties are elected to three-year terms.

New Jersey's 566 municipalities include cities, towns, townships, boroughs, and villages. Most have the mayor-council, commission, or council-manager form of government. Most of the large cities have the mayor-council form. Municipalities get their charters from the state. They choose from among a variety of charters. Before a municipality can adopt a new charter or revise an existing one, it must create a charter study commission. Local voters must approve the new or revised charter.

Revenue. Taxes account for more than half of the state's *general revenue* (income). Most of the rest comes from federal grants, charges for government services, rents on leased property, casino taxes, and a state

The state governors of New Jersey

*Democratic-Republican

lottery. The chief sources of tax revenue are a personal income tax and a general sales tax. Other major sources are taxes on public utilities, corporate income, motor fuels, motor vehicle licenses, tobacco products, insurance premiums, and taxes on inheritance.

Politics. In the late 1800's, most New Jersey governors were Democrats. Since 1900, the office has been about equally divided between Democrats and Republicans. The Republicans had a majority in the state Senate and General Assembly during most of the early 1900's. But Democrats won increased support in state elections during the late 1950's and early 1960's. Since then, control of the houses of the legislature has passed between the Democrats and the Republicans several times.

Since 1856, New Jersey's electoral votes have been evenly split between Republican and Democratic presidential candidates. For New Jersey's electoral votes and voting record, see **Electoral College** (table).

History

Indian days. Before European settlement, perhaps 8,000 Indians lived in what is now New Jersey. They spoke an Algonquian dialect and called themselves *Lenape,* meaning *genuine people.* Europeans called them the Delaware. The Indians lived by hunting, fishing, gathering, and by planting corn, squash, and beans. See **Delaware Indians.**

Exploration. Giovanni da Verrazzano, an Italian navigator in the service of France, was probably the first European to explore the New Jersey coast. He reached the coast in 1524. Henry Hudson, an English sea captain employed by the Netherlands, explored the Sandy Hook Bay area in 1609. He also sailed up the river that now bears his name. The Dutch explorer Cornelius Mey sailed the Delaware River in 1614. Cape May was later named for him. Many Dutch trading ships visited the New Jersey area during the 1600's.

Settlement. The Dutch and the Swedes were the first white settlers in New Jersey. The Dutch founded an outpost in Pavonia (now part of Jersey City) about 1630. Indian uprisings prevented permanent settlement until 1660. That year, the Dutch built the fortified town of Bergen (now part of Jersey City). Bergen was New Jersey's first permanent white settlement.

Traders and settlers from Sweden arrived in southern New Jersey in 1638. The Dutch settlers feared Swedish competition in the fur trade. The Dutch forced the Swedes out of the New Jersey area in 1655.

English control. English armies won control of New Jersey and other Dutch North American possessions in 1664. King Charles II of England gave the New Jersey area to his brother, James, Duke of York. James, in turn, gave it to two of his friends, Lord John Berkeley and Sir George Carteret. James named the area New Jersey in honor of Carteret, who had served as governor of Jersey, an island in the English Channel. Berkeley and Carteret offered to sell the land to colonists at low prices. They also allowed settlers to have political and religious freedom. These policies attracted many settlers to New Jersey.

In 1674, a group of Quakers headed by Edward Byllynge bought Berkeley's share of New Jersey. Two years later, the colony was divided into two sections—West Jersey and East Jersey. Byllynge and his associates made West Jersey the first Quaker colony in America. Carteret owned East Jersey until his death in 1680. Another group of Quakers, called the *Twenty-Four Proprietors,* bought East Jersey in 1682.

New Jersey's political and religious freedom attracted a variety of groups. Puritans, Baptists, and Scotch-Irish arrived during the late 1600's. White settlers imported slaves from Africa. However, the large number of landowners and groups of settlers led to disputes over who owned the land. The colonists also objected to paying rent to the owners. Many colonists rioted during the 1690's. The owners gave up East and West Jersey in 1702. England then united the two colonies as a single royal colony.

Colonial days. New Jersey had twin capitals from 1703 to 1775. They were Perth Amboy, the former capital of East Jersey, and Burlington, the former capital of West Jersey. At first, the governor of New York also ruled New Jersey. But strong protests from the colonists forced England to give New Jersey its own governor in 1738. Lewis Morris, the first colonial governor, served from 1738 to 1746.

Colonial New Jersey was a rural society. By the 1760's, the colony had about 100,000 people. The English king appointed the colonial governor and a 12-member council. The people elected a colonial assembly. But only freeholders who owned property valued at 50 pounds or more were allowed to vote. Fifty pounds in 1760 equals about $2,000 today.

The Revolutionary War. During the 1760's, Britain passed a series of laws that caused unrest in New Jersey and the other American Colonies. Most of these laws either set up severe taxes or restricted colonial trade. Some New Jerseyites urged the colonists to remain loyal to Britain in spite of the laws. But many colonists believed that political and religious freedom could be retained only through independence from Britain.

In 1774, a group of New Jerseyites dressed as Indians burned a supply of British tea stored in a ship at Greenwich, near Salem. This event, called the *Greenwich Tea Burning,* was similar to the more famous Boston Tea Party of 1773. Like the Boston Tea Party, the action symbolized colonial opposition to British taxation policies. See **Boston Tea Party.**

The Revolutionary War began in Massachusetts in 1775. Large numbers of New Jerseyites joined the patriots in their fight for independence, and many other New Jerseyites fought on the British side. New Jersey's location between New York City and Philadelphia made it a major battleground during the war. The Americans and British fought nearly a hundred engagements in New Jersey. The most important ones included the battles of Trenton in 1776, Princeton in 1777, and Monmouth in 1778.

Before the Battle of Trenton, George Washington made his famous surprise crossing of the Delaware River on Christmas night. During the war, Washington's army camped two winters at Morristown and a third at

Detail of *Washington at Monmouth* (1857), an oil painting on canvas by Emanuel Leutze; Monmouth County Historical Association

George Washington led colonial forces in the Battle of Monmouth in 1778. The many important Revolutionary War battles fought in New Jersey earned it the nickname *Cockpit of the Revolution.*

Bound Brook. See **Revolutionary War in America** (The war in the North).

During the Revolutionary period, two New Jersey cities served as the temporary national capital. They were Princeton, from June 30 to Nov. 4, 1783, and Trenton, from Nov. 1 to Dec. 24, 1784.

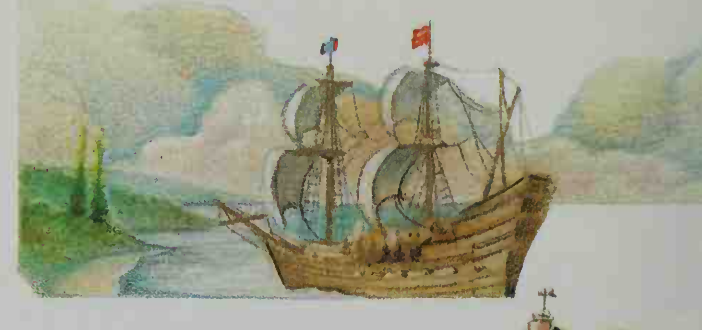
New Jersey declared its independence from Britain and adopted its first constitution on July 2, 1776. On Nov. 26, 1778, it ratified the Articles of Confederation (the forerunner of the United States Constitution).

The New Jersey delegates to the Constitutional Convention of 1787 proposed a plan to protect the interests of small states. This *New Jersey Plan* suggested that all states have equal representation in Congress. But the convention adopted the *Great Compromise* instead. The compromise created the present two-house Congress. The states have equal representation in the Senate. Their representation in the House of Representatives is based on population. New Jersey became a state on Dec. 18, 1787, when it ratified the U.S. Constitution. It was the third state to do so. William Livingston became New Jersey's first state governor.

The 1800's. One of the most famous duels of all time was fought at Weehawken in 1804. Aaron Burr, the Vice President of the United States, shot and killed his political rival, Alexander Hamilton. In 1804, New Jersey passed legislation to begin the gradual freeing of slaves held in the state. The act freed all children born into slavery when the men reached the age of 25 and the women reached 21.

Public demand for a more democratic state government led to the adoption of a new state constitution in 1844. The new Constitution provided for the separation of powers among the legislative, judicial, and executive branches of the state government. The Constitution also provided for a bill of rights and for the election of the governor by the people. In 1845, Charles C. Stratton became the first New Jersey governor so elected.

About 88,000 New Jersey men served in the Union army during the American Civil War (1861-1865). But there was much pro-Southern sympathy in the state. In 1864, New Jersey was one of only three states that voted against the reelection of President Abraham Lincoln.



New Jersey was one of the first great industrial states. As early as 1792, Paterson had become a textile center. Later, the city became known for the manufacture of locomotives and for silk production. Other New Jersey cities grew because of industry. Trenton specialized in clay products, iron, and steel. John Roebling, who built the Brooklyn Bridge, had his firm in Trenton. Camden, Elizabeth, Jersey City, Newark, and Passaic all became major manufacturing centers in the 1800's.

Improvements in transportation during the first half of the 1800's helped New Jersey to grow industrially. New canals connected New Jersey cities to Philadelphia and New York City. New railroads expanded the transportation system. As industry grew, thousands of Europeans came to New Jersey cities to work in factories. At first, most came from Ireland and Germany. Later, large numbers came from Italy and eastern Europe. By 1910, more than half the state's people had been born outside the United States or had parents who were born in other countries. With the growth of industry, city populations increased and farm populations decreased. By 1900,

Important dates in New Jersey

1524 Giovanni da Verrazzano explored the New Jersey coast.

1609 Henry Hudson explored Sandy Hook Bay and sailed up the Hudson River.

1630? The Dutch established an outpost in Pavonia.

1660 The Dutch established a permanent settlement in Bergen (now part of Jersey City).

1664 The Dutch surrendered New Jersey to England.

1776 New Jersey adopted its first constitution.

1783-1784 Princeton and Trenton each served briefly as the national capital.

1787 New Jersey became the third state when it ratified the U.S. Constitution on December 18.

1844 New Jersey adopted its second constitution.

1858 The first dinosaur skeleton discovered in North America was found buried in Haddonfield.

1869 Rutgers defeated the College of New Jersey (now Princeton), by a score of 6 to 4, in New Brunswick in the world's first intercollegiate football game.

1879 Thomas A. Edison developed the first practical incandescent lamp in Menlo Park.

1911 Many reforms were enacted under Governor Woodrow Wilson.

1947 New Jersey adopted its third constitution.

1952 The New Jersey Turnpike opened.

1969 New Jersey voters approved a state lottery to raise money for the state government and for the schools.

1976 New Jersey adopted an individual income tax.

1978 Casino gambling began in Atlantic City.

1993 Christine Todd Whitman became the first woman to be elected governor of New Jersey.

more New Jerseyites were living in cities and towns than in rural areas.

During the late 1800's, New Jersey became the home of many of the nation's *trusts* (industrial monopolies). Trusts were illegal in many other states, but New Jersey law allowed them. New Jersey also attracted many *holding companies* during this period. A holding company is a company that controls the stock and policies of one or more other companies. By 1900, hundreds of large corporations obtained charters under New Jersey laws and set up headquarters in the state.

The early 1900's. Concern about possible abuses of big businesses led to a reform movement in New Jersey. In 1910, the people elected Woodrow Wilson, the president of Princeton University, as governor. Under Wilson, the state passed laws providing for direct primary elections, workers' compensation, and a public utilities commission. The legislature also passed laws restricting business monopolies. Wilson's achievements as governor helped lead to his election as president of the United States in 1912. He was reelected in 1916.

Thomas A. Edison helped develop the motion picture while working in New Jersey. Fort Lee became the motion picture capital of the world in the early 1900's. There, Fatty Arbuckle, Mary Pickford, Pearl White, and other stars made movies that introduced a new era in entertainment.

After the United States entered World War I in 1917, Hoboken became a major port for shipping troops overseas. Thousands of American soldiers sailed for France from this Hudson River port. During the war, Camp Dix and Camp Merrit served as military training centers. New Jersey factories contributed chemicals, munitions, and ships to the war effort.

Between 1900 and 1930, New Jersey's population more than doubled. During the same period, the state's annual value of manufacturing rose from about $500 million to almost $4 billion. New Jersey, like other states, suffered widespread unemployment during the Great Depression of the 1930's.

Museum of Modern Art

Early motion pictures were made in studios at Fort Lee. Silent film star Mary Pickford, shown with director Maurice Tourneur, *left,* made *Poor Little Rich Girl* at Fort Lee in 1917.

The mid-1900's. New Jersey's electronics and chemical industries began large-scale operations about 1940. These industries grew during World War II (1939-1945), when the state produced communications equipment, ships, and weapons and ammunition.

In 1947, New Jersey voters approved a new state constitution. The Constitution extended the governor's term from three to four years and increased the powers of the office. The new Constitution also reorganized the state's court system.

In the mid-1900's, the state's population expanded steadily into many rural areas. The expansion included construction of homes and of commercial and industrial plants. Commercial and industrial growth occurred most rapidly among chemical, electronics, food-processing, pharmaceutical, and research firms.

The New Jersey Turnpike opened in 1952 and soon became one of the nation's busiest highways. The turnpike links the Philadelphia and New York City metropolitan areas. The Garden State Parkway, completed in 1955, runs along the New Jersey coast.

During the 1960's, older New Jersey cities faced the problem of spreading slums, especially in black neighborhoods. In July 1967, riots broke out in black neighborhoods of several cities. The worst riot occurred in Newark, where 26 persons were killed and more than 1,000 were injured. Property damage totaled between $10 million and $15 million.

In the late 1960's, the state adopted a sales tax and several bond issues to help pay for major government programs. One bond issue supplied money for new state colleges, highways, institutions, and commuter train facilities. Another paid for water conservation projects and for a program to fight water pollution. In 1969, voters approved a state lottery to raise money for the state government and for the schools.

The late 1900's. The state continued to seek new sources of revenue. In 1976, the Legislature adopted an individual income tax for the first time. Also in 1976, the voters passed a referendum permitting gambling casinos in Atlantic City to help raise more money for the disabled and the elderly. The first casino opened in 1978.

Large urban renewal projects of the late 1900's upgraded parts of several New Jersey cities. The program in Trenton included construction of a group of state government office buildings and a cultural center. In Newark, the state built or expanded several college and university facilities, including a new branch campus for Rutgers The State University of New Jersey.

Although passenger railroad travel has declined nationwide since the mid-1900's, New Jersey kept its position as a major rail center. Newark Airport began a major construction program in 1963 to expand passenger and cargo service. In the 1980's, it became one of the world's busiest airports.

New Jersey, the most densely populated state, faces problems related to overcrowding. Its population density strains the environment and puts huge demands on the state government to provide social services.

Recent developments. In 1994, Christine Todd Whitman became the state's first female governor. She left office in 2001 when President George W. Bush named her to head the U.S. Environmental Protection Agency.

Questions

What unique name do the county governments in New Jersey have?
What are the largest cities in New Jersey?
How did Lord John Berkeley and Sir George Carteret attract settlers to New Jersey?
What are New Jersey's four main land regions?
What is New Jersey's best-known annual event? When and where does it take place?
What New Jersey governor became President of the United States?
What is the most important economic activity of New Jersey?
What percentage of New Jersey's people live in cities and towns?
When and at what place was the first library in New Jersey established?
What cities in New Jersey served as the national capital during the Revolutionary War period?

New Jersey Plan. See Constitution of the United States (The compromises); New Jersey (The Revolutionary War).

New Kingdom of Granada. See Colombia (History).

New Left was a radical political and social movement of the 1960's and early 1970's in the United States. The New Left included many college students and other young people. The movement was considered "new" in relation to the "old left" of the 1930's. The "old left" generally was guided by Marxist ideas and supported Soviet policies.

Members of the New Left demanded sweeping and fundamental changes in American society. They attacked most major institutions for claiming to support demo-

cratic principles but failing to end such injustices as poverty, racial discrimination, and class distinctions. Many New Leftists opposed capitalism and believed the desire for profits leads to *imperialism,* a policy that favors extending influence over another country.

People who identified themselves with the New Left were not all members of a single organization, and they frequently disagreed among themselves. Members of the New Left ranged from pacifists to violent revolutionaries. Many New Leftists favored such tactics as nonviolent civil disobedience. But their actions often led to bloody clashes with the police and other law enforcement officials. The most important elements of the New Left included the militant wings of the peace movement during the Vietnam War, the movement for racial equality, and the students' rights movement.

The peace and civil rights movements appealed especially to young people. Their experiences in civil rights and peace demonstrations convinced many of them that war and discrimination could be ended only by a general reformation of American society. Several radical student organizations appeared in the early 1960's, including the Students for a Democratic Society (SDS) and the Free Speech Movement. Radical students began to consider the university as an accomplice of war and racism. They used disruptive tactics in an effort to reform their universities or to use them as a base for revolutionary activities.

Most members of the New Left showed little interest in conventional politics and did little to get sympathetic candidates elected to public office. But many people believe that the antiwar movement helped persuade President Lyndon B. Johnson not to run for reelection in 1968.

After 1968, the New Left split into several factions. For example, the revolutionaries split over tactics for defeating imperialism. Some urged an alliance with American workers, but others favored organizing the world's poor and nonwhite peoples.

The New Left failed to bring about radical changes in American society. But it formed the basis for several movements that remain active today, such as the women's and environmentalist movements. Christopher Lasch

New London, Connecticut (pop. 25,671), is the home of the United States Coast Guard Academy. It is also the trading, banking, transportation, and distribution center for southeastern Connecticut. The city's position at the mouth of the Thames River, near the eastern entrance of Long Island Sound, makes it an important seaport (see **Connecticut** [political map]). New London and Norwich form a metropolitan area with 293,566 people. During the mid-1800's, New London's whaling fleet was second in size only to that of New Bedford, Massachusetts. Today, copper, paper products, and steel coils are the principal cargoes shipped to New London's State Pier.

New London is the center of research and development for a pharmaceutical manufacturer. The U.S. Naval Submarine Base and a submarine manufacturer are located across the Thames River in Groton. Their presence has attracted a number of defense-related consulting and engineering firms to New London. The city is the home of Connecticut College and Mitchell College.

New London was settled in 1646 and incorporated in 1784. In 1781, during the Revolutionary War in America, the city was burned by a British raiding party led by the American traitor Benedict Arnold. New London has a council-manager form of government. Stephen Fagin

New London Naval Submarine Base, in Groton, Connecticut, is the chief training center of the United States Navy's submarine force. It also houses the Submarine School and headquarters of the Submarine Group TWO. The base covers 497 acres (201 hectares) on the Thames River, 1 mile (1.6 kilometers) northeast of New London. Connecticut gave the land to the federal government in 1868 for naval purposes. The U.S. Navy established a coaling station there in 1872. The Navy first used submarines at the New London naval base in 1900.

The submarine base houses the offices of over 40 separate military commands. It also is the home of the U.S.S. *Nautilus* Memorial and the Submarine Force Library and Museum. The *Nautilus,* the world's first nuclear-powered submarine, was built in Groton and launched in 1954. Critically reviewed by the United States Navy

New mathematics was an educational movement during the late 1950's and the 1960's that attempted to change the teaching of mathematics in the United States. The growth of space exploration, computer technology, and other scientific fields had created a need for better training in mathematics. To meet this need, several independent groups of mathematicians and educators in the United States tried to design better math curriculums. Their general goals were to modernize course content, give students a deeper understanding of mathematical principles, and encourage creative problem solving.

Traditional math programs stressed the development of basic computational skills—such as how to add, subtract, multiply, and divide—through repetitious drills and memorization. New math programs urged students to understand concepts rather than learn rules. To provide a better understanding of numbers, for example, many programs taught students to work problems in numeration systems with bases other than 10 (see **Numeration systems**).

The educators who developed the new programs agreed on general goals but disagreed on specific goals and methods. As a result, many different curriculums were created. All became known as the *new mathematics* or *new math.*

Because of several obstacles, however, few schools established effective new math programs. For example, many institutions did not give teachers an adequate opportunity to learn the new material. Textbooks continued to present old methods and goals. Sections on new math topics—such as bases other than 10 and *sets* (collections of objects or ideas)—were merely added to the old lessons. (See **Set theory.**)

New math topics were often taught with the old focus on computational skills rather than on the learning of concepts. For example, teachers asked students to translate numbers from base 10 to another base rather than work math problems entirely within the non-10 base.

During the 1970's, students' achievement scores declined, and many people blamed new math. New math fell out of favor and was replaced by an even stronger focus on basic skills. Thus, new math was never widely implemented. Karen Connors Fuson

Scattered pines grow in a canyon near Los Alamos. Thousands of people visit New Mexico each year to enjoy its warm climate, beautiful scenery, and rich Spanish and Indian cultures.

New Mexico *The Land of Enchantment*

New Mexico, a Southwestern state of the United States, is called the *Land of Enchantment* because of its scenic beauty and rich history. Every year, thousands of tourists go to this state for hunting, fishing, skiing, or sightseeing. New Mexico is the fifth largest state in area. Only Alaska, Texas, California, and Montana have a greater area. But the state is thinly populated. Mountain ranges, rugged canyons, and rocky deserts cover much of New Mexico.

A person vacationing in New Mexico might see the state as a land of beautiful scenery, Spanish fiestas, and Indian ceremonies. But a scientist would think of New Mexico as a center of research into rockets and nuclear energy. An oil company executive might regard the state as a rich source of gasoline for automobiles, or of natural gas for cooking and heating. A retired couple might choose to make their home in the southern part of New Mexico because its location and high altitude provide warm, sunny days and cool nights. A rancher might be impressed by New Mexico's vast stretches of grazing land.

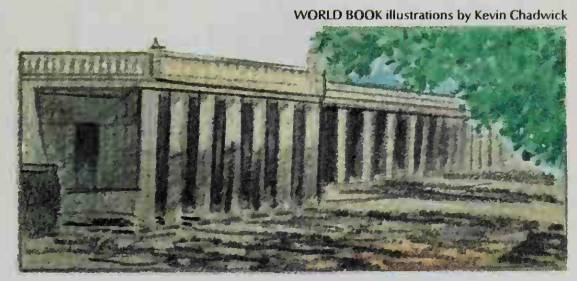
Much of New Mexico's growing industry springs from the science of the nuclear age. The first atomic bomb was built and exploded in New Mexico in 1945. Today, scientists in New Mexico search for a way to make space rockets travel on nuclear power. Other scientists develop ways to use nuclear power for generating electricity, or work on improving nuclear weapons for defense.

New Mexico ranks among the leading states in mining. Natural gas and petroleum are New Mexico's most important mineral products by far. Large deposits of gas and petroleum lie in both the northwestern and southeastern parts of the state. In addition, New Mexico's resources include major deposits of coal, copper, potash, and uranium.

Cattle ranching is the most important type of farming in the state. Thousands of cattle graze on the vast plains

The contributor of this article is Stanley A. Morain, Director of the Earth Data Analysis Center at the University of New Mexico.

Interesting facts about New Mexico



El Camino Real (the Royal Highway) stretched from Santa Fe to Mexico City. It was the first road established by Europeans in what is now the United States. It was traveled about 1581 and was later used primarily as a trade route. Portions of it still exist and can be explored.

The Smokey Bear Historical State Park was established in Capitan in 1979. The symbol of Smokey was first used by the United States Forest Service in 1944. In 1950, a real "Smokey Bear" was found clinging to a burned tree after a fire swept through Lincoln National Forest. The orphaned bear cub became the living Smokey Bear. The bear died in 1976 and was buried in what is now Smokey Bear Historical State Park.

WORLD BOOK illustrations by Kevin Chadwick

The Palace of the Governors

The Palace of the Governors in Santa Fe is the oldest government building in the United States. The Spanish built it as part of a fortress during the winter of 1609-1610. In 1909, it was converted to the Palace of the Governors History Museum. The building now houses exhibits on Spanish, Mexican, and American colonization dating back to the late 1500's.

© Edna Douthat

Taos Pueblo is a Pueblo Indian village in north-central New Mexico. The Pueblo Indians have traditionally lived in stone or adobe structures that resemble modern apartment buildings.

and in the mountain valleys of New Mexico.

New Mexico's colorful past gives the state important tourist attractions. Still standing are the ruins of an apartment house with about 800 rooms built by the Indians hundreds of years before Christopher Columbus arrived in America. Spain ruled the land for more than 220 years. The Spanish influence may be seen today in the names of places, in the churches of early missionaries, in foods, and in customs and holidays. Colorful people such as Kit Carson, Geronimo, and Billy the Kid played major parts in the history of the New Mexico area in territorial days.

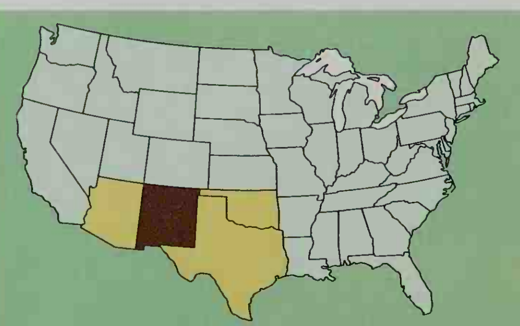
Many other historical features capture the interest of visitors to New Mexico. Within the state remain portions of the oldest road established by Europeans in the United States. This route, called *El Camino Real* (the Royal Highway), was first traveled about 1581. Santa Fe, the capital of New Mexico, ranks as the oldest seat of government in the United States. It was founded as the capital of a Spanish province as early as 1609 or 1610. The largest city in New Mexico is Albuquerque, which the Spaniards founded in 1706.

© James Blank, West Stock

Albuquerque is New Mexico's largest city. It serves as an industrial, trade, and transportation center of the Southwest.

New Mexico in brief

Symbols of New Mexico

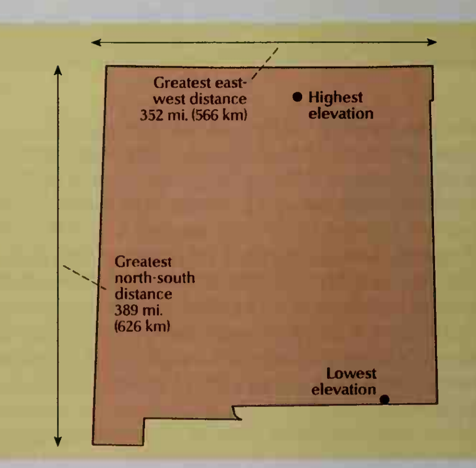


On the state flag, adopted in 1925, the ancient sun symbol of the Zia Pueblo Indians appears in crimson on a gold field. These were the colors of Queen Isabella of Castile that the Spanish Conquistadors brought to the New World. On the state seal, commissioned in 1912, a large eagle shielding a smaller eagle represents the annexation of New Mexico by the United States.

State flag

State seal

New Mexico (brown) ranks 5th in size among all the states and 2nd in size among the Southwestern States (yellow).



The State Capitol is in Santa Fe, which was founded as the capital of the Spanish province of New Mexico in 1609 or 1610.

General information

Statehood: Jan. 6, 1912, the 47th state.
State abbreviations: N. Mex. or N.M. (traditional); NM (postal).
State motto: *Crescit Eundo* (It Grows as It Goes).
State song: "O, Fair New Mexico." Words and music by Elizabeth Garrett.

Land and climate

Area: 121,599 sq. mi. (314,939 km²), including 234 sq. mi. (605 km²) of inland water.
Elevation: *Highest*—Wheeler Peak, 13,161 ft. (4,011 m) above sea level. *Lowest*—2,817 ft. (859 m) above sea level at Red Bluff Reservoir in Eddy County.
Record high temperature: 122 °F (50° C) at Waste Isolation Pilot Plant near Carlsbad on June 27, 1994.
Record low temperature: −50 °F (−46 °C) at Gavilan, near Lindrith, on Feb. 1, 1951.
Average July temperature: 74 °F (23 °C).
Average January temperature: 34 °F (1 °C).
Average yearly precipitation: 13 in. (33 cm).

Important dates

1540-1542 Francisco Vásquez de Coronado of Spain explored the New Mexico region.

1598 Juan de Oñate founded New Mexico's first permanent Spanish settlement at San Juan.

1821 New Mexico became a province of Mexico. William Becknell opened the Santa Fe Trail.

1848 Mexico ceded New Mexico to the United States.

Electoral votes: 5

Sources of information

For information about the state's tourism and economy, write to: New Mexico Department of Tourism, 491 Old Santa Fe Trail, Santa Fe, NM 87503. The Web site at www.newmexico.org also provides tourist information.
The state's official Web site at www.state.nm.us also provides a gateway to much information on New Mexico's economy, government, and history.

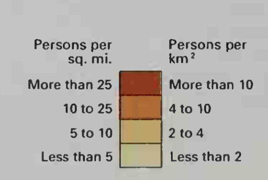
1912 New Mexico became the 47th state on January 6.
1922 Geologists discovered oil in southeastern and northwestern New Mexico.
1945 The world's first atomic bomb was exploded near Alamogordo.
1970's Completion of the San Juan-Chama project brought water through the Rocky Mountains to north-central New Mexico.
1998 New Mexico celebrated the 400th anniversary of the settlement of San Juan.

People

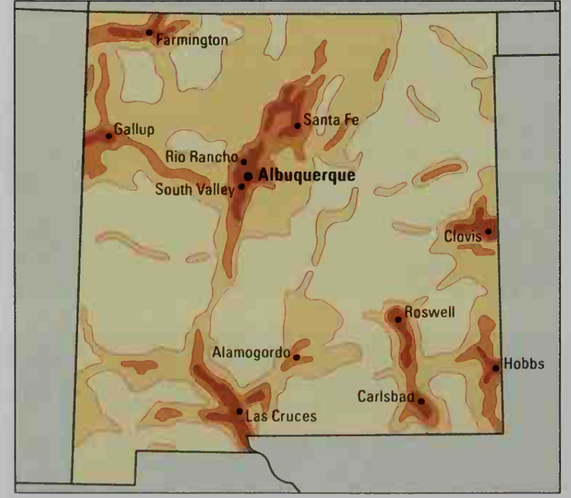
Population. The 2000 United States census reported that New Mexico had 1,819,046 people. This includes over 750,000 Hispanic Americans and nearly 175,000 American Indians. The population had increased 21 percent over the 1990 figure, 1,515,069. According to the 2000 census, New Mexico ranks 36th in population among the 50 states. More than half of New Mexico's people live in the state's three metropolitan areas. These areas are Albuquerque, Las Cruces, and Santa Fe.

Most New Mexicans are descended from one of the three major groups that settled the area—Indians, Spaniards, and English-speaking Americans. New Mexico has a higher percentage of Indians and Hispanics than any other state. About 42 percent of the people are Hispanic, and nearly 10 percent are Indian. The way of life of the Indians may be much like that of their ancestors. The Indians might live in a *pueblo* (village) or on a reservation. The Spanish influence shows in place names, foods, and customs. Many New Mexicans speak both English and Spanish. Non-Hispanic whites, the state's largest group, account for about 45 percent of the population. New Mexico has small numbers of African Americans and Asians.

Schools. In the early 1600's, Spanish Roman Catholic priests began establishing schools in New Mexico to teach Christianity to the Indians. Public education was established in the state in the late 1800's.



The State Board of Education, which consists of 10 elected members and 5 members appointed by the governor, establishes school policies. The board hires a superintendent of public instruction, who carries out the policies. State law requires children from ages 5 through 17 to attend school. For the number of students and teachers in New Mexico, see **Education** (table).

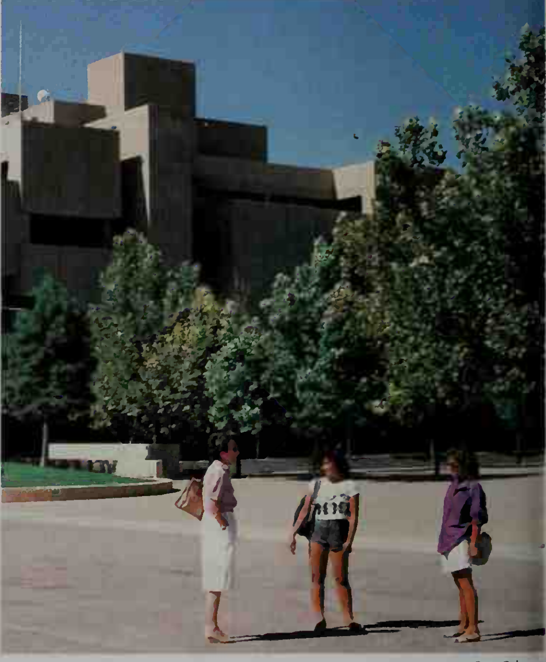


Libraries and museums. The New Mexico Territorial Library was established in Santa Fe in 1851. Part of this collection was used to form the State Library. The state's first public library was founded in Cimarron in 1871.

The Museum of New Mexico in Santa Fe includes the Fine Arts Museum, Museum of Indian Arts and Culture, Museum of International Folk Art, and Palace of the Governors. The Wheelwright Museum of the American Indian, also in Santa Fe, features Navajo ceremonial art. The New Mexico Museum of Natural History and Science in Albuquerque has exhibits on the Southwest. The Los Alamos Bradbury Science Museum traces the development of nuclear energy. The Albuquerque Museum has cultural artifacts relating to the region. Other museums include the Farm and Ranch Heritage Museum in Las Cruces, the National Atomic Museum in Albuquerque, and the Roswell Museum and Art Center in Roswell.

Population density

Much of New Mexico is covered by mountains and deserts, making it one of the most thinly populated states. About a third of the people live in or near Albuquerque.



WORLD BOOK map based on U.S. Census Bureau data.

Universities and colleges

This table lists the universities and colleges in New Mexico that grant bachelor's or advanced degrees and are accredited by the North Central Association of Colleges and Schools.

Visitor's guide

New Mexico's scenery and outdoor activities attract visitors throughout the year. The state offers skiing in winter, fishing in spring and summer, and hunting in the fall. Scenic beauty ranges from rose-colored deserts to snow-capped mountains. Lovers of history can visit Indian ruins, frontier forts, and Spanish missions.

Indian ceremonies, Spanish fiestas, and local rodeos are among the most interesting events for visitors. The dates of events may vary from year to year, and among the different tribes and pueblos. Numerous Indian ceremonies are held throughout the year.

Inter-Tribal Indian Ceremonial in Gallup

Places to visit

Following are brief descriptions of some of New Mexico's most interesting places to visit:

Carlsbad Caverns National Park. This series of huge caves in southeastern New Mexico is one of the world's great natural wonders. Lighted trails offer an excellent opportunity for visitors to see fantastic rock formations. Hundreds of thousands of bats fly out of the caverns at dusk and return at dawn. See Carlsbad Caverns National Park.

Chaco Culture National Historical Park, located near Farmington, is the site of ruins of early Indian culture. See **Chaco Culture National Historical Park.**

Gila Wilderness, near Silver City, became—in 1924—the first area in the country to be set aside as a national wilderness. It is preserved in its natural condition.

Los Alamos Bradbury Science Museum shows the development of nuclear energy.

Pecos National Historical Park, near Santa Fe, contains the ruins of what was once the largest Indian pueblo in New Mexico. See Pecos National Historical Park.

Puyé Cliff Dwellings are ancient Indian "apartment houses" west of Española.

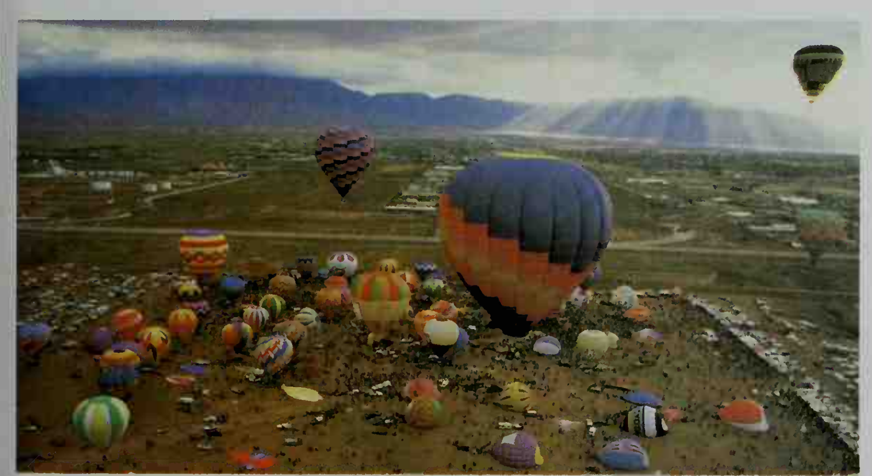
Salmon Ruins, near Bloomfield, is a site of archaeological importance. It features pueblo ruins and a nearby museum.

San Miguel Mission, in Santa Fe, was built by the Spaniards in about 1610 and was restored in 1710.

National forests, monuments, and wilderness areas. New Mexico has seven national forests. Gila, north of Silver City, is the largest. The others are Apache, near Luna and Reserve; Carson, near Taos; Cibola, which consists of several separate forests; Coronado, near Rodeo; Lincoln, near Alamogordo; and Santa Fe, near Santa Fe. Apache and Coronado national forests lie partly in Arizona. Several areas of the forests are preserved as national wilderness areas.

There are 10 national monuments in New Mexico. They include outstanding remains of ancient Indian civilization. They are Aztec Ruins, an ancient pueblo; Bandelier, the ruins of four pueblos; Capulin Volcano, the cone of an extinct volcano; El Malpais, prehistoric lava flows near Grants; El Morro, the site of Inscription Rock; Fort Union, an old Santa Fe Trail military post; the Gila Cliff Dwellings, a onetime Indian settlement; Petroglyph, the site of ancient rock art outside Albuquerque; Salinas Pueblo Missions, with pueblo ruins and a Spanish mission; and White Sands, a deposit of gypsum sand.

State parks and monuments. New Mexico has 40 state parks and 5 state monuments. For detailed information about the parks and monuments, write Superintendent, State Park and Recreation Division, P.O. Box 1147, Santa Fe, NM 87503.



Annual events

January-March
King's Day Dances in most Indian pueblos (January 6); Winter Festival in Red River (January); Winter Ski Fiesta in Santa Fe (late February); Rio Grande Arts and Crafts Festival in Albuquerque (early March); dances at most Indian pueblos (Easter).

April-June
Green Corn Dance at San Felipe Pueblo (May 1); Ralph Edwards Festival in Truth or Consequences (early May); Four-Corners Hot-Air Balloon Fiesta near Farmington (late May); Taos Spring Arts Celebration (May-June); Sandia Classic Hang Gliding Competition in Albuquerque (mid- June).

July-September
Apache Indian Ceremonial in Mescalero (July 4th weekend); Rodeo de Santa Fe (mid-July); Puyé Cliff Ceremonial at Santa Clara Pueblo (last Saturday and Sunday in July); Green Corn Dance at Santo Domingo Pueblo (August 4); "Billy the Kid" Pageant in Lincoln (early August); Inter-Tribal Indian Ceremonial in Gallup (mid-August); Santa Fe Indian Market (late August); Great American Duck Race in Deming (late August); Fiesta de Santa Fe (mid-September); New Mexico State Fair in Albuquerque (mid-September); Feast Day in Taos Pueblo (late September).

October-December
The Whole Enchilada Fiesta in Las Cruces (early October); Eastern New Mexico State Fair in Roswell (early October); Navajo Fair in Shiprock (early October); International Balloon Fiesta in Albuquerque (mid-October); Farolito Walk on Canyon Road in Santa Fe (December 24); Christmas Eve Dances in Mission Churches at many Indian pueblos (December 24); Christmas Eve Luminaria Tours in Albuquerque (December 24).

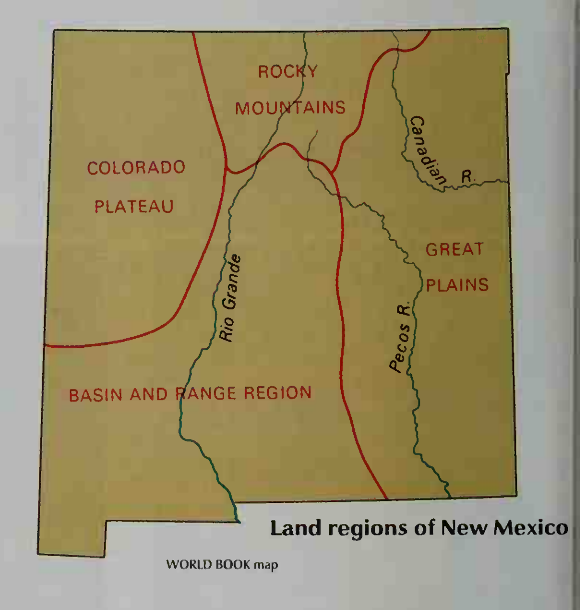
Land and climate

Land regions. New Mexico has four main land regions: (1) the Great Plains, (2) the Rocky Mountains, (3) the Basin and Range Region, and (4) the Colorado Plateau.

The Great Plains of New Mexico are part of the vast Interior Plain that sweeps across North America from Canada to Mexico. In New Mexico, the Great Plains cover roughly the eastern third of the state. They extend from a high plateau in the north to the Pecos River Valley in the south. Streams have cut deep canyons in the plateau as it slopes away from the Rocky Mountains. Cattle and sheep graze there. To the south are dry farming and irrigated agriculture. The eastern edge of the state, south of the Canadian River, is called the *High Plains* or *Llano Estacado* (Staked Plain). The Llano Estacado also covers much of northwestern Texas (see **Texas** [Land regions]).

The Rocky Mountains extend into north-central New Mexico from Colorado south to a point near Santa Fe. In winter, deep snow piles up on the mountains. In spring, the snow melts and provides water for irrigated crops in the fertile Rio Grande Valley. The Rio Grande, which rises in Colorado, cuts between ranges of mountains. To the east are the Sangre de Cristo (Blood of Christ) Mountains. Wheeler Peak, 13,161 feet (4,011 meters) high, is the highest point in the state. The Nacimiento and Jemez ranges are west of the river.

The Basin and Range Region covers about a third of the state. It extends south and west from the Rockies to the borders with Arizona and Mexico. This region includes scattered ranges of rugged mountains—the Guadalupe, Mogollon, Organ, Sacramento, and San Andres ranges. Broad desert *basins* (low places where the streams have no outlet) lie between the mountains. The largest basins are the Jornada del Muerto (Journey of the Dead) and the Tularosa. The Rio Grande flows through the Basin and Range Region.



The Colorado Plateau, in northwestern New Mexico, is a broken country of wide valleys and plains, deep canyons, sharp cliffs, and rugged, lonely, flat-topped hills called *mesas*. The best-known mesa in the state is Acoma. The Indians built a city on top of Acoma. To the west of Acoma is a 40-mile (64-kilometer) strip of *malpais,* an area of extinct volcanoes and lava plains. Ship Rock, a steep hill that resembles a ship under full sail, has been a famous landmark in San Juan County for hundreds of years. Ship Rock rises 1,678 feet (511 meters) above the flat land around it. The San Juan Basin lies in the northwest section of the Colorado Plateau. The *Continental Divide* passes through both the Colorado Plateau and the Basin and Range Region. Streams west of the divide run into the Pacific Ocean. Water east of it runs to the Gulf of Mexico.

Rivers and lakes. The Rio Grande runs like a backbone down the length of New Mexico. At the state's southern boundary it turns east and forms the border

Ken Gallard, Click/Chicago

Sheep graze on a New Mexico ranch. Farmers in the state raise sheep and cattle where low rainfall or rough land prevents crop farming. Ranching is the state's leading agricultural activity.

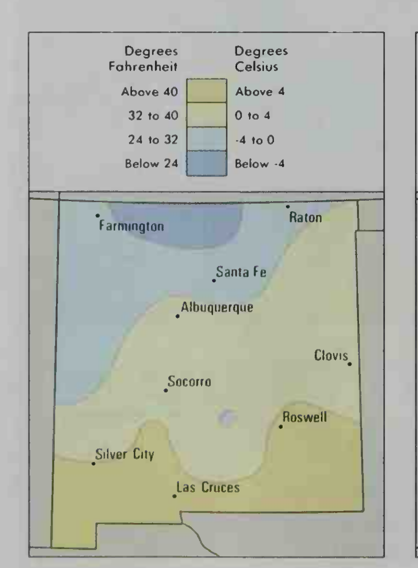
Specially created for *The World Book Encyclopedia* by Rand McNally and World Book editors

between Texas and Mexico. A series of dams stores water for irrigation. Elephant Butte Dam, near Truth or Consequences, blocks the Rio Grande and forms Elephant Butte Reservoir, New Mexico's largest lake. Its water irrigates land in New Mexico, Texas, and Mexico. Another important river is the Pecos. It rises in the Sangre de Cristo Mountains, and then flows south. The Pecos provides irrigation water for the land around Carlsbad and Roswell. The San Juan River drains the northwest corner of the state. The Canadian River rises in the northeast part. Its waters are stored for irrigation at the Conchas Dam, near Tucumcari. The Gila River, in the southwest, flows west into Arizona.

New Mexico has few natural lakes. Most famous are the deep Bottomless Lakes, a group of pools near Roswell. Artificially created lakes other than Elephant Butte Reservoir include Abiquiu, Avalon, Bluewater, Caballo, Cochiti, Conchas, Eagle Nest, El Vado, Heron, McMillan, Navajo, Sumner, and Ute.

Plant and animal life. Forests cover about a fourth of New Mexico. Common trees include aspens, cottonwoods, Douglas firs, junipers, piñons (nut pines), ponderosa pines, scrub oaks, spruces, and white firs. The yucca, New Mexico's state flower, grows in most areas. Desert plants include cactus, creosote bush, gramma grass, mesquite, white and purple sage, and soapweed. Cattle ranchers guard their livestock from the poisonous locoweed. Wild mountain plants include forget-me-nots, saxifrages, sedges, alpine larkspur, and other flowers.

Animal life is plentiful in New Mexico. Among the larger animals are black bears, coyotes, mountain lions, pronghorn antelope, deer, and elk. Other animals include badgers, beavers, bobcats, chipmunks, foxes, jack rabbits, minks, otters, and prairie dogs.



Among the state's game birds are ducks, grouse, pheasants, quail, and wild turkeys. Many varieties of geese and sandhill cranes migrate to New Mexico for the winter. Common fishes include black bass, catfish, crappies, perch, suckers, and trout. Two kinds of poisonous snakes, the rattlesnake and the coral snake, live in New Mexico. The southwestern desert is the home of such spiders as the tarantula and the black widow.

Climate. New Mexico has a dry, warm climate. A person may hang out clothes in the rain knowing the rain will stop soon, and the air will dry the clothes quickly. The state averages less than 20 inches (51 centimeters) of *precipitation* (rain, melted snow, and other forms of moisture) a year. It varies from over 20 inches in the northern mountains to less than 10 inches (25 centimeters) in the south and central areas. Snow falls throughout the state. The south receives only about 2 inches (5 centimeters) a year. The high mountains may get as much as 300 inches (760 centimeters) of snow each year.

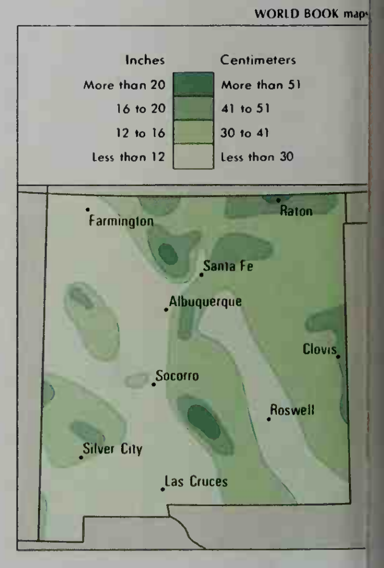
Average January temperatures
Temperatures vary widely throughout the state during wintertime. The far southern section has the mildest winters.



Average July temperatures
The state has warm summers. The mildest temperatures occur in the mountainous areas of northern New Mexico.

Average yearly precipitation
New Mexico has a dry climate. Much of the west receives less than 12 inches (30 centimeters) of rain a year.

WORLD BOOK maps

The average July temperature is about 74 °F (23 °C). January temperatures are generally warmer in the south than in the north. The state's average January temperature is 34 °F (1 °C). Day and night temperatures vary widely on the same day. The thin, dry air does not stay warm after sundown because of the high altitude. The lowest temperature recorded in New Mexico was −50 °F (−46 °C) at Gavilan, near Lindrith, on Feb. 1, 1951. The highest temperature was 122 °F (50 °C) near Carlsbad on June 27, 1994.

Economy

While New Mexico has limited water resources and large tracts of desert, the state's natural resources continue to play a major role in its economy. Tourism, mining, and agriculture provide valuable jobs for the state's workers.

The state's scenic beauty and reputation as an arts and cultural center attract tourists all year. The state's handcrafted Indian pottery and jewelry are world famous. Tourists flock to New Mexico's many ski resorts in the winter. Large petroleum and natural gas reserves make New Mexico an important mining state, and cattle ranching provides the most farm income.

Large federal government research laboratories are among New Mexico's leading employers. Electronic products are the state's major type of manufacture.

Natural resources include large mineral deposits and rich, renewable resources based on the soil. These include forests, grasses, plants, and animals.

Minerals. New Mexico is rich in mined products that supply energy. It has large reserves of natural gas, petroleum, and uranium. The state is the nation's leading producer of potash, a vital fertilizer material, and of perlite. New Mexico has one of the largest copper reserves in the nation. The state also ranks high in the production of gypsum, mica, molybdenum, pumice, salt, and zeolites. Other resources include gold, iron ore, lead, magnetite, manganese, silver, and zinc.

Soil. More than half of New Mexico's soil is stony and shallow, and not good for farming. Some desert land contains chemicals that prevent trees from growing. However, this land supports some shrubs, flowers, and grasses. The eastern part of the state has sandy soil.

Water is precious in New Mexico, and water resources are extremely important. New Mexico and other Western states have joined with Mexico to share the use of water in various streams. Each area gets a share. For example, Colorado users must allow a certain amount of Rio Grande water to flow into New Mexico. New Mexico's resources include underground water.

New Mexico has 10 major storage projects that help make good use of water. These projects regulate the flow of the Canadian, Pecos, Rio Grande, and San Juan rivers, and that of some of their tributaries.

Forests cover about a fourth of the state. There are commercially valuable timberlands in eight mountain areas. The most common trees include the aspen, cottonwood, Douglas-fir, juniper, piñon, ponderosa pine, scrub oak, spruce, and white fir.

Intel Corporation

Computer and electronic equipment is New Mexico's leading manufactured product. These technicians produce microprocessors at an Intel Corporation facility in Rio Rancho. They wear special clothing that prevents dust or hair from getting into the tiny circuits.

Production and workers by economic activities

Economic activities	Percent of GSP* produced	Employed workers	
		Number of people	Percent of total
Community, business, & personal services	18	287,500	30
Government	17	186,500	20
Manufacturing	16	51,800	6
Wholesale and retail trade	14	205,900	22
Finance, insurance, & real estate	13	59,300	6
Transportation, communication, & utilities	8	39,500	4
Mining	7	19,100	2
Construction	5	60,400	6
Agriculture	2	35,900	4
Total	100	945,900	100

*GSP = gross state product, the total value of goods and services produced in a year. Figures are for 1998.
Sources: *World Book* estimates based on data from U.S. Bureau of Economic Analysis and U.S. Bureau of Labor Statistics.

Service industries provide the greatest part of New Mexico's *gross state product*—the total value of all goods and services produced in a state in a year. Many of the service industries are concentrated in the state's metropolitan areas.

New Mexico's leading service industry is community, business, and personal services. This group employs more people than any other industry group in the state. Such services include private health care, motels and ski resorts, engineering companies, private research laboratories, and repair shops. Tourists visiting New Mexico contribute billions of dollars to its economy each year.

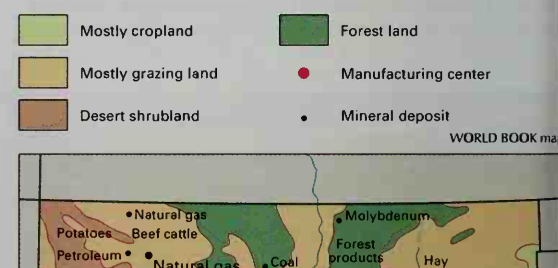
Government ranks second in terms of its contribution to New Mexico's gross state product. Federal government research laboratories and military bases play a major role in the state's economy. Los Alamos National Laboratory is a world leader in research of military and nonmilitary uses of nuclear energy. Sandia National Laboratories in Albuquerque is a center of nuclear weapons research. Military bases in New Mexico include Cannon Air Force Base in Clovis, Holloman Air Force Base in Alamogordo, Kirtland Air Force Base near Albuquerque, and White Sands Missile Range in the south-central part of the state. The Bureau of Indian Affairs, a federal government agency, assists the state's Indian population. Government services also include the operation of public schools and hospitals.

Wholesale and retail trade is the state's third-ranking service industry. The wholesale trade of groceries, motor vehicles, and petroleum products is important in New Mexico. Major retail businesses include automobile dealerships, discount stores, and food stores.

Finance, insurance, and real estate ranks next among New Mexico's service industries. Real estate provides the most income for this industry group. New Mexico's rapid population growth has led to the development of many new homes and office buildings. Albuquerque is the chief banking and insurance center in the state.

Transportation, communication, and utilities are the state's fifth-ranking service industry. Oil and gas pipeline companies are a large part of the transportation sector. Telephone companies play an important role in the communications sector. Utilities provide electric, gas, and water service. More information about transportation and communication appears later in this section.

Manufacturing. Goods made in New Mexico have a *value added by manufacture* of about $10 billion a year. This figure represents the increase in value of raw materials after they become finished products.



Computer and electronic equipment is New Mexico's leading manufactured product by far, accounting for about 80 percent of the state's value added by manufacture. Two major electronics companies, Honeywell and Intel, have large operations in the Albuquerque area. Honeywell's factory makes military communication systems. Intel's plant produces silicon chips for computers. Telephone equipment is another important type of electronic good manufactured in New Mexico.

Other products manufactured in New Mexico include chemicals, clothing, concrete, food products, petroleum products, and printed materials. Large oil refineries operate near Artesia, Farmington, and Gallup. The Albuquerque area is the state's chief manufacturing center.

Mining. New Mexico is a leading state in the annual

Economy of New Mexico

This map shows the economic uses of land in New Mexico and where the leading farm, mineral, and forest products are produced. Major manufacturing centers are shown in red.

value of mined products. Natural gas and petroleum together account for about 80 percent of the state's total income from mined products. Natural gas is produced in northwestern and southeastern New Mexico. Much of New Mexico's gas is sent by pipeline to other states. Lea County is the leading petroleum producer, and San Juan County is the leading natural gas producer.

Copper and potash account for most of New Mexico's income from nonfuel mined products. Copper is mined primarily in Grant County. Potash, an ingredient in many fertilizers, comes mainly from deep underground mines in Lea and Eddy counties in southeastern New Mexico. Large surface mines in the northwest produce most of the state's coal. New Mexico ranks among the leading producers of molybdenum, which is used mainly in making steel alloys. A single mine in Taos County produces all of the state's molybdenum. Uranium is mined in McKinley County. Gold and silver are recovered as by-products of copper processing.

Agriculture. New Mexico has about 16,000 farms and ranches. Farmland covers about 55 percent of the state's land area. Cattle ranching is the leading agricultural activity. Ranchers raise beef cattle in almost every part of the state. Most of the beef cattle are shipped to other states for fattening and slaughtering. Dairy cattle are raised mainly in southern and eastern New Mexico. Sheep ranching is also important. Most of New Mexico's cropland is irrigated. The state's leading crop is hay, used to feed cattle. New Mexico is a leading state in the production of chili peppers and pecans. Other crops include cotton, grain sorghum, onions, and wheat.

Electric power. Power plants that burn coal supply about 70 percent of the electric power generated in New Mexico. Most of the rest comes from plants that burn natural gas. Nearly half the power produced in New Mexico is sold to other states. New Mexico has abundant geothermal energy resources, but they are largely undeveloped.

Transportation. New Mexico has about 60,000 miles (97,000 kilometers) of roads and highways. The first road established by Europeans in what is now the United States—El Camino Real (the Royal Highway)—ran from Santa Fe to Mexico City, Mexico. Spaniards first traveled this route in about 1581. The Santa Fe Trail was opened in 1821 between Missouri and New Mexico. Today, Interstate 25 east of Santa Fe follows this old trail.

Albuquerque International Airport is the state's chief airport. New Mexico's first railroad, the Atchison, Topeka and Santa Fe (now part of Burlington Northern Santa Fe Corporation), began operating in the state in 1878.

Communication. The first Spanish-language newspaper in New Mexico, *El Crepúsculo de la Libertad* (The Dawn of Liberty), began in 1834 at Santa Fe. The *Santa Fe Republican,* the first English-language paper, was founded in 1847. Today, the state has about 50 newspapers, with about 15 dailies. The most widely read papers are the *Albuquerque Journal, The Albuquerque Tribune,* the *Las Cruces Sun-News,* and *The Santa Fe New Mexican.*

The state's first radio station, KOB, began broadcasting from Albuquerque in 1922. The first television station, KOB-TV, started regular programming from Albuquerque in 1948. New Mexico has about 100 radio stations and 15 television stations. Cable TV systems and Internet providers serve communities statewide.

Government

Constitution. New Mexico is governed under its original state Constitution. The Constitution was adopted in 1911, a year before New Mexico became a state. It has been amended more than 100 times.

Amendments may be proposed by either house of the state Legislature. They must be approved by a majority of the voters in a regular or special election. Some sections of the Constitution require special majority votes to be amended. These sections guarantee the voting rights and education of Spanish-speaking people. Amendments to these sections must be approved by three-fourths of the voters in the state and by two-thirds of the voters in each county. A constitutional convention may be called by a two-thirds vote of the Legislature, if a majority of the voters approve. The voters must approve amendments proposed by a constitutional convention.

Executive. New Mexico's governor serves a four-year term. Other executive officers elected to four-year terms are the lieutenant governor, secretary of state, auditor, treasurer, attorney general, and commissioner of public lands. Executive officers may hold office for any number of terms, but not for more than two terms in a row. The 10 members of the State Board of Education are also elected by the people, for six-year terms.

Much of the governor's authority lies in the power of appointment. For example, the governor appoints three of the seven members of the State Board of Finance and is a member of the board as well. The governor also appoints most of the directors or board members who run state agencies and institutions. The governor may veto legislation passed by the state Legislature.

Legislature of New Mexico consists of a 42-member Senate and a 70-member House of Representatives. There are 42 senatorial districts and 70 representative districts. Voters in each senatorial district elect one senator. Voters in each representative district elect one representative. Senators serve four-year terms. Members of the House of Representatives serve two-year terms.

The Legislature meets every year on the third Tuesday in January. The sessions are limited to 60 days in odd-numbered years, and to 30 days in even-numbered years. The governor may call the Legislature into special session. The Legislature may call itself into extraordinary session. The Constitution provides for a referendum, but not for initiative (see **Initiative and referendum**).

Courts. The state Supreme Court is the highest court. It has five justices elected to eight-year terms. Terms are staggered so an entirely new court is not elected in any one election. Every two years, the justices select a member of the court to be chief justice.

The Court of Appeals has seven judges, who are elected to eight-year staggered terms. Panels made up of three judges hear appellate cases. Most cases that this court hears may be taken to the Supreme Court.

District courts are the state's principal trial courts. New Mexico has 47 district judges elected from 13 judi-

WORLD BOOK photo by Michael Heller

The New Mexico House of Representatives meets in the House chambers in the State Capitol in Santa Fe. Each of the 70 representatives is elected to a two-year term.

cial districts. They hold district court sessions in each of the state's 33 counties. District judges are elected for six-year terms. They also serve as juvenile judges if the defendant is under 18 years old. Other New Mexico courts include magistrate, metropolitan, and probate courts.

Local government. New Mexico has 33 counties. A city-county council administers Los Alamos County. Each of the other counties is run by a board of commissioners. All commissioners are elected to four-year terms. They may serve two terms in a row but must then wait two years before they can be elected again to any public office. Council members are elected to two-year terms except those in Bernalillo and San Juan counties, who are elected to four-year terms.

State law gives *municipalities* (towns, villages, or cities) a wide choice of form of government. Most common are the mayor-council, commission, and city manager-commission forms. Cities can adopt their own charters. Alamogordo, Albuquerque, Clovis, Gallup, Las Vegas, Los Alamos, and Silver City have their own. Municipal elections occur every two years.

The governors of New Mexico

	Party	Term
William C. McDonald	Democratic	1912-1916

Gary E. Johnson	Republican	1995-

Revenue. Taxes account for about half of the state government's *general revenue* (income). Federal grants and other United States government programs and charges for state government services make up most of the rest. A general sales tax provides the greatest portion of New Mexico's tax revenue. Other sources of tax revenue include taxes on personal income, mining, and motor fuels.

Politics. In voter registration, Democrats usually outnumber Republicans by about 2 to 1. The eastern part of New Mexico was settled largely by Southerners, who generally vote for Democrats. In the north-central counties, the Spanish American population has been largely Democratic since the early 1930's. Centers of Republican strength lie in the northeast, northwest, and central portions of the state. For New Mexico's electoral votes and voting record in presidential elections, see **Electoral College** (table).

History

Indian days. Indians have lived in what is now New Mexico for thousands of years. Stone spearheads found at Folsom and other places indicate that Indians hunted in northeastern New Mexico at least 10,000 years ago. The spearheads are known as *Folsom points.* See **Folsom point.**

From about 500 B.C. to A.D. 1200, the Mogollon Indians lived in the valleys in the area of the New Mexico-Arizona border. At first the Mogollon Indians lived in houses dug partly into the ground. Later, they built villages that stood above the ground. See **Mogollon.**

Another group of ancient Indians lived in the region where New Mexico, Arizona, Utah, and Colorado meet. These Indians were the Anasazi, who had one of the most highly developed civilizations in North America. The Anasazi raised corn and cotton, and tamed wild turkeys. The large birds provided food and clothing. During the winter, the Indians wore robes made of turkey feathers and rabbit fur. Some Anasazi were cliff dwellers and built many-storied apartment houses of closely fitted stones. Many other Anasazi built apartment houses on flat surfaces. One such building, the *Pueblo Bonito* (pretty village), probably had about 600 or 700 rooms. Sometimes the Anasazi built towns on top of

The ruins of Indian cliff dwellings have been preserved at Bandelier National Monument near Santa Fe. The Anasazi people built homes on protected ledges, *lower right,* or lived in caves in cliff walls. Most cliff dwellings were built between A.D. 1000 and 1300.

Rubinsteen, West Stock

steep mesas. The Pueblo Indians are the descendants of these people. See **Anasazi.**

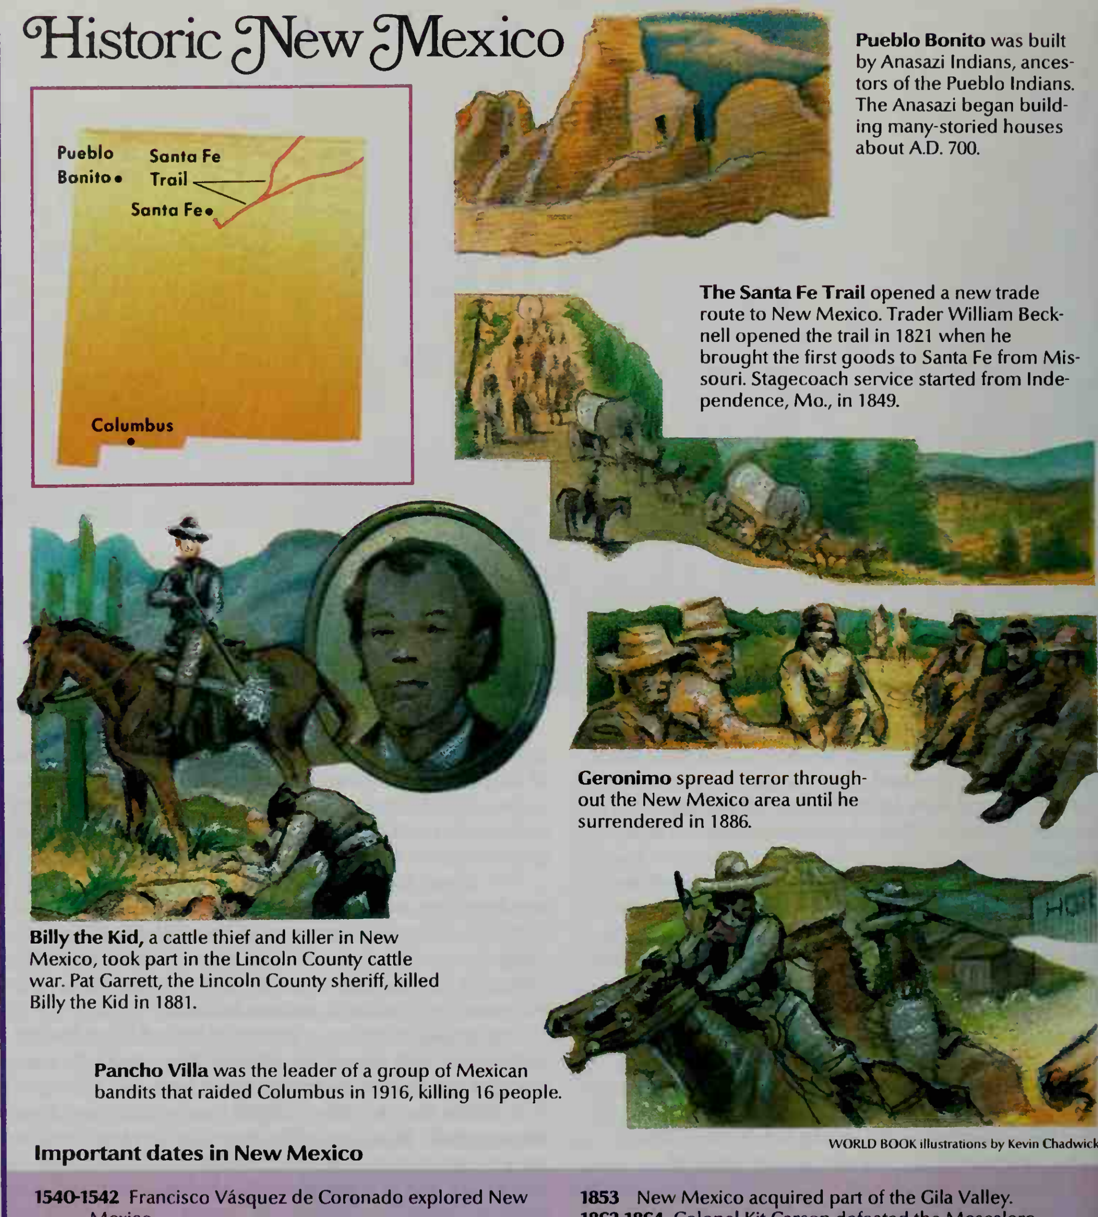
The Navajo and Apache tribes came from the north about A.D. 1500. The Ute and Comanche came a few years later.

Exploration and settlement. The first Spanish explorers reached the New Mexico area almost by accident. Álvar Núñez Cabeza de Vaca was a member of a group seeking gold in Florida in 1528. He and others became separated from the expedition's ships. In an attempt to reach New Spain (now Mexico), they sailed on barges to the Texas coast. In 1536, after wandering for eight years, Cabeza de Vaca and three companions—two white men and a black man—reached a settlement near the Pacific coast of New Spain. They told stories of seven cities of great wealth, called the *Seven Cities of Cíbola,* to the north. See **Cíbola, Seven Cities of.**

The Spaniards were determined to find the seven rich cities. Guided by Cabeza de Vaca's black companion, Estevanico, also called Estéban, a priest named Marcos de Niza made a search in 1539. He claimed the area as a province of Spain. Marcos de Niza also reported that he had seen one of the cities from a distance.

Francisco Vásquez de Coronado, also in search of the seven cities, explored present-day New Mexico and Arizona from 1540 to 1542. But he found only the pueblos of the Indians. Fray Augustín Rodríguez and Captain Francisco Sánchez Chamuscado traveled up the Rio Grande from New Spain in 1581. The report of a later explorer, Antonio de Espejo, led to colonization of the region.

The first Spanish colony in New Mexico was established in 1598 at the Pueblo of San Juan de Los Caballeros, near the Chama River. The colony was financed and established by Juan de Oñate. He became governor of the province of New Mexico. Oñate was succeeded as governor by Pedro de Peralta, who moved the capital to Santa Fe in 1609 or 1610. Santa Fe is the oldest seat of government in the United States.



The colony had little wealth and grew very slowly. It was kept alive mainly by the efforts of missionaries. Roman Catholic priests from Spain established schools to teach Christianity to the Indians. But repeated quarrels occurred between the church and civil authorities, and between the Spaniards and the Indians.

The Spaniards set up a system of forced labor for the Indians that was almost like slavery. The Spaniards also charged the Indians an annual tax of corn and blankets. In addition, they kept the Indians from worshiping their ancient gods. Popé, an Indian from the San Juan Pueblo, led a revolt in 1680. The Indians killed more than 400 Spaniards, and drove the rest to what is now Juarez, Mexico. The Indians destroyed almost every trace of the Roman Catholic Church.

In 1692, the Spanish governor Diego de Vargas took back the province with little trouble. Four years of scattered fighting broke the power of the Pueblo Indians. The colonists and priests returned to build homes and missions in and near Santa Fe. For 125 years, the Spaniards and Pueblo Indians lived fairly peacefully in this lonely outpost of the Spanish Empire.

Mexican rule. Trappers and traders came to New Mexico from the United States during the early 1800's. Spanish officials feared the newcomers, and expelled them or put them in prison. But the Spanish officials were replaced in 1821, after Mexico won its freedom from Spain. New Mexico became a province of Mexico. That same year, William Becknell, an American trader,

Historic New Mexico

Pueblo Bonito was built by Anasazi Indians, ancestors of the Pueblo Indians. The Anasazi began building many-storied houses about A.D. 700.

The Santa Fe Trail opened a new trade route to New Mexico. Trader William Becknell opened the trail in 1821 when he brought the first goods to Santa Fe from Missouri. Stagecoach service started from Independence, Mo., in 1849.

Geronimo spread terror throughout the New Mexico area until he surrendered in 1886.

Billy the Kid, a cattle thief and killer in New Mexico, took part in the Lincoln County cattle war. Pat Garrett, the Lincoln County sheriff, killed Billy the Kid in 1881.

Pancho Villa was the leader of a group of Mexican bandits that raided Columbus in 1916, killing 16 people.

WORLD BOOK illustrations by Kevin Chadwick

Important dates in New Mexico

1540-1542 Francisco Vásquez de Coronado explored New Mexico.

1598 Juan de Oñate founded the first permanent Spanish colony, at San Juan.

1609 or 1610 Governor Pedro de Peralta established Santa Fe.

1680 The Pueblo Indians revolted and drove the Spaniards out of northern New Mexico.

1692 Diego de Vargas reconquered New Mexico for Spain.

1706 Francisco Cuervo y Valdes founded Albuquerque.

1821 Mexico won its independence from Spain, and New Mexico became a province of Mexico. William Becknell opened the Santa Fe Trail.

1846 General Stephen W. Kearny took control of New Mexico during the Mexican War.

1848 Mexico ceded New Mexico to the United States.

1850 Congress created the Territory of New Mexico.

1853 New Mexico acquired part of the Gila Valley.

1862-1864 Colonel Kit Carson defeated the Mescalero Apache and Navajo Indians.

1876 Cattlemen began the Lincoln County War.

1886 The surrender of Geronimo ended the Apache Wars.

1912 New Mexico became the 47th state on January 6.

1916 Mexican bandits raided Columbus.

1922 Geologists discovered oil in the southeastern and northwestern regions of New Mexico.

1945 The first atomic bomb was exploded at Trinity Site near Alamogordo.

1950 Paddy Martinez, a Navajo Indian, found uranium in the northwest region.

1970's Completion of the San Juan-Chama project brought water to north-central New Mexico.

1998 New Mexico celebrated the 400th anniversary of the founding of the colony at San Juan.

opened the Santa Fe Trail to bring goods to New Mexico from Missouri.

Mexico ruled the area for the next 25 years, a period filled with unrest. In 1837, Mexicans and Indians in New Mexico rebelled against the Mexican government. They executed the governor and seized the Palace of Governors in Santa Fe. A Taos Indian, José Gonzales, was installed as their chief executive. But a month later, Mexico's General Manuel Armijo crushed the rebellion and became governor.

In 1841, an expedition from Texas (then an independent country) invaded New Mexico. The Texans claimed the land east of the Rio Grande. However, Mexican troops defeated the invaders and sent them as captives to Mexico City. They were later freed.

The Mexican War. As colonists from the United States pushed west, trouble developed between the United States and Mexico. In 1846, war broke out, and U.S. forces under General Stephen W. Kearny took control of New Mexico with little resistance. The Treaty of Guadalupe Hidalgo ended the war in 1848, and the U.S. took possession of the region. See Mexican War.

Territorial days. In 1850, Congress organized New Mexico as a territory. The territory also included what is now Arizona and parts of present-day Colorado and Nevada. In 1853, the Gadsden Purchase enlarged the territory (see **Gadsden Purchase**). Mexico sold the United States land south of the Gila River, between the Rio Grande and the Colorado River. New Mexico got its present boundaries in 1863, after Congress organized the territories of Colorado and Arizona.

Early in the Civil War (1861-1865), Confederate forces from Texas captured much of the region, including Albuquerque and Santa Fe. Union forces recaptured the territory in March 1862, after two battles southeast of Santa Fe. The first clash was fought in Apache Canyon, and the second in Glorieta Pass. Between 1862 and 1864, Colonel Kit Carson, a famous frontier scout, led the New Mexicans in forcing both the Mescalero Apache and the Navajo Indian tribes to live on a reservation.

During the late 1870's, cattlemen and other groups fought for political control of Lincoln County. The bitterness burst into open violence with the murder of rancher John G. Tunstall. Billy the Kid and other outlaws took a leading part in the fighting, which became known as the Lincoln County War. General Lew Wallace was appointed territorial governor in 1878. He pardoned the fighters to end the bloodshed. Pat Garrett, the sheriff of Lincoln County, killed Billy the Kid in 1881. Sheriffs, including Garrett, and territorial governors helped establish order during the 1880's.

The Apache Chief Victorio led frequent fierce attacks on settlers from 1879 until his death in 1880. Geronimo, one of the last hostile Apache leaders, spread terror through the area until he surrendered on Sept. 4, 1886. During the late 1800's, after railroads linked the territory to the rest of the nation, New Mexico experienced a cattle and mining boom.

Early statehood. New Mexico became the 47th state on Jan. 6, 1912. It had a population of about 330,000. The people elected William C. McDonald as the first state governor.

Mexican rebels, probably led by Pancho Villa, raided the town of Columbus in 1916, killing 16 Americans. The U.S. Army sent an expedition into Mexico to catch Villa, but it failed. During World War I, New Mexico sent over 17,000 men into the armed forces.

In the early 1920's, a long drought made life difficult for farmers and ranchers. Livestock prices dropped, and the stock owner's financial troubles spread. Banks closed and many people lost their savings. But new businesses developed. Oil was discovered in the 1920's, and huge potash deposits at Carlsbad were opened. In 1930, the famous caverns near Carlsbad became a national park, and the tourist industry grew.

World War II. When the United States entered World War II in 1941, the 200th Coast Artillery, composed of New Mexico soldiers, was in the Philippine Islands. The Japanese overwhelmed the regiment, along with the rest of the U.S. forces on Bataan Peninsula. Many of the soldiers were killed, and others spent over three years in Japanese prison camps. The war ended after U.S. planes dropped two atomic bombs on Japan in August 1945. The bombs had been produced at Los Alamos, a town and laboratory built secretly in the New Mexico mountains. The world's first atomic bomb was exploded at Trinity Site, near Alamogordo, on July 16, 1945.

The mid-1900's. After World War II ended in 1945, the government continued to spend large amounts of money in New Mexico for research. The state's economy and population both grew rapidly as the government provided funds for work on nuclear power develop-

ment and experiments with rockets. The economy also was aided by the discovery of uranium in northwestern New Mexico in 1950.

The state's coal industry grew in the mid-1960's. A large coal mine was opened near Raton, and coal-burning electric generating plants were built near Farmington. But production of potash decreased in the Carlsbad area due to competition from Canadian potash mines.

The New Mexico tourist industry continues to grow. Income from tourists almost doubled from the mid-1960's to 1970. Construction and improvement of winter sports resorts helped to increase tourism.

Lack of water has always created problems in New Mexico. Some of these problems were solved with completion of the San Juan-Chama project in the 1970's. This project brings water to north-central New Mexico through tunnels from branches of the San Juan River in the Rocky Mountain area. Reservoirs built near Chama and Abiquiu as part of the project provide recreational facilities and water for irrigation.

Recent developments. Today, New Mexico ranks as a leading center for space and nuclear research. The largest private employer in the state is Sandia National Laboratories of Albuquerque, which conducts research and does engineering work on the uses of nuclear energy. At Los Alamos, government scientists work on many projects involving military and nonmilitary uses of nuclear energy. Military bases and manufacturing for military projects also contribute to the economy.

Although military-related projects continue to play a large role in New Mexico's economy, reductions in U.S. military spending slowed this part of the economy. Substantial reductions took place in the early 1990's after the Soviet Union broke up and the Cold War ended. But the growth of nongovernment industries helped compensate for the military reductions. Tourism has continued to play a strong role in the state's economy into the 1990's. Manufacturing and construction industries in New Mexico experienced growth in the early 1990's. In 1998, New Mexico celebrated the 400th anniversary of the founding of the colony at San Juan. Stanley A. Morain

New Mexico, University of, is a state-controlled coeducational school in Albuquerque, New Mexico. It has colleges of architecture and planning, arts and sciences, education, engineering, fine arts, nursing, and pharmacy; schools of law, management, and medicine; and a University College. Students belong to the University College their first year, after which they may enter one of the other colleges. The university also has graduate divisions of public administration and dental programs. The university grants bachelor's, master's, and doctor's degrees. Branch campuses of the University of New Mexico are in Gallup, Los Alamos, and Valencia County, and graduate centers are in Los Alamos and Santa Fe.

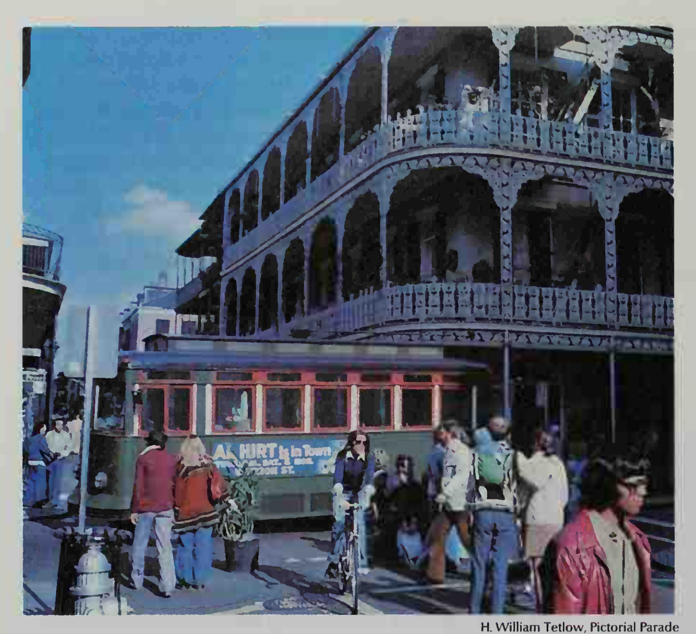
The university's Maxwell Museum of Anthropology contains a major collection of objects made by the Anasazi Indians, who were ancestors of the Pueblo Indians. In addition, the Albuquerque campus has museums of biology, geology, and meteoritics; art galleries; and a 2,200-seat concert hall. The University of New Mexico was founded in 1889.

Critically reviewed by the University of New Mexico

New Mexico State University is a coeducational institution in Las Cruces, New Mexico. It has colleges of agriculture and home economics, arts and science, business administration and economics, education, engineering, and human and community services. The graduate school grants master's and doctor's degrees. Cooperative programs in education, engineering, mathematics, physics, and accounting are available. The university also has special research facilities in computing and in plant genetics.

New Mexico State University was founded in 1888 as Las Cruces College, and in 1889 became New Mexico College of Agriculture and Mechanic Arts. The university received its present name in 1960.

Critically reviewed by New Mexico State University



New Netherland was a region in America claimed by the Dutch in the early 1600's. It included parts of what are now Connecticut, Delaware, New Jersey, and New York.

In 1621, merchants in the Netherlands formed the Dutch West India Company to compete with the Spanish Empire, colonize New Netherland, and develop the region's fur trade. Thirty families, sponsored by the trading company, began a Dutch colony at the mouth of the Hudson River in 1624. In 1625, the Dutch settlers founded New Amsterdam (now New York City) there. Peter Minuit, governor (or director-general) of New Netherland, bought Manhattan Island from the Indians in 1626. The Dutch set up trading posts at what are now Albany, New York; Hartford, Connecticut; and Trenton, New Jersey.

The Dutch West India Company attracted settlers from many European countries. About 20 languages were spoken in the colony, and many religions were represented. The Dutch colonists became allies of the Iroquois Indians, and they fought other tribes and neighboring French colonists. By the 1650's, a fierce trading rivalry had built up between the Dutch and the English. In 1664, the English sent a fleet of warships to capture New Netherland for the Duke of York. Many of the Dutch colonists refused to fight, and Governor Peter Stuyvesant was forced to surrender to the English. New Netherland became the English colony of New York.

Dan McCoy, Black Star

New Orleans's famous attractions include its historic French Quarter and colorful Mardi Gras parades. The lacy iron grillwork that decorates many French Quarter buildings is a trademark of the city. The Mardi Gras festivities end the day before Lent begins.

New Orleans

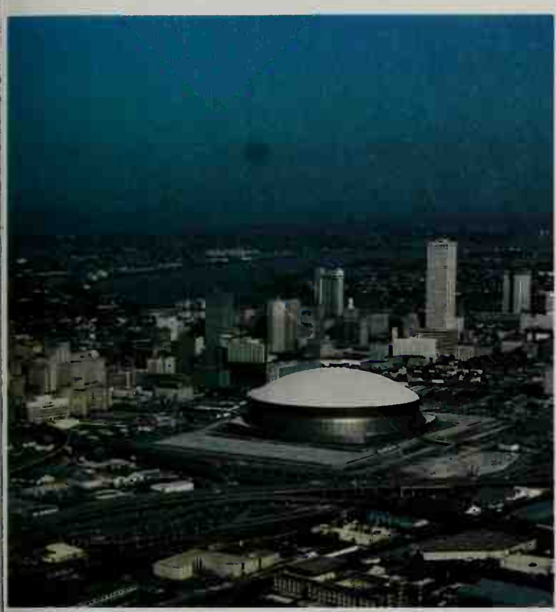
New Orleans, *AWR lee uhnz, awr LEENZ,* or *AWR luhnz,* is the largest city in Louisiana and one of the world's busiest ports. It is also a leading business, cultural, and industrial center of the Southern United States. New Orleans lies along the Mississippi River about 100 miles (160 kilometers) north of where the river flows into the Gulf of Mexico. This location has helped make the city a great shipping center.

Many people call New Orleans *America's Most Interesting City.* Each year, several million tourists visit New Orleans. The largest crowds come for the annual Mardi Gras celebration, with its spectacular parades and other merry festivities. Tourists are also attracted by the city's historic French Quarter, much of which has the charm of an old European town. In addition, a large number of visitors come to New Orleans to hear top jazz musicians perform in the city that helped give birth to jazz in the early 1900's.

New Orleans is the South's oldest major city. It was founded in 1718 by Jean Baptiste le Moyne, Sieur de Bienville. Bienville was governor of the French colony of Louisiana. He named New Orleans after Philippe, Duke of Orléans, who ruled France for King Louis XV, then a youth. The flags of France, Spain, the Confederate States, and the United States have flown over the city.

Today, New Orleans is a colorful blend of old and new. Most of the historic sites have been preserved, while urban renewal programs have replaced many decaying structures with striking new buildings. But like many other large U.S. cities, New Orleans faces such problems as crime, poverty, and slums.

Ralph E. Thayer, the contributor of this article, is Professor of Urban Planning and Public Administration at the University of New Orleans.



The city

New Orleans covers 364 square miles (943 square kilometers), including 165 square miles (427 square kilometers) of inland water. The city occupies all of Orleans Parish and has the same boundaries as the parish. In Louisiana, counties are called *parishes.*

New Orleans is often called the *Crescent City* because its original section—the French Quarter—lay along a giant curve in the Mississippi River. Today, the main part of the city lies between the river on the south and Lake Pontchartrain on the north. Much of New Orleans is below sea level and lacks natural drainage. To prevent floods during heavy rainstorms, the city relies on one of the world's greatest systems of drainage pumps. The system's 112 pumps can draw off 25 billion gallons (95 billion liters) of water a day. New Orleans has also built about 130 miles (209 kilometers) of walls, called *levees,* in order to help prevent floods. The longest levees lie

Facts in brief

Population: *City*—484,674. *Metropolitan area*—1,337,726.
Area: *City*—364 mi^2 (943 km^2). *Metropolitan area*—3,400 mi^2 (8,806 km^2), excluding inland water.
Climate: *Average temperature*—January, 54 °F (12 °C); July, 82 °F (28 °C). *Average annual precipitation* (rainfall, melted snow, and other forms of moisture)—54 inches (137 cm). For the monthly weather, see **Louisiana** (Climate).
Government: Mayor-council. *Terms*—4 years for the mayor and the seven council members.
Founded: 1718. Incorporated as a city in 1805.

Christopher R. Harris from Katherine Young

The Louisiana Superdome lies at the edge of downtown New Orleans. The 95,427-seat stadium, the world's largest indoor arena, is used for conventions, sports events, and trade shows.

along the Mississippi River and Lake Pontchartrain.

Downtown New Orleans borders the east bank of the Mississippi. Most of the city's residential districts lie west, north, and east of the downtown area. The rest occupy a finger-shaped area on the river's west bank. This area, known as Algiers, is the only part of New Orleans on the west bank.

Downtown New Orleans includes the French Quarter and the main business district. The French Quarter was named after the French colonists who first settled the area. It is also called the *Vieux Carré* (pronounced *vee yoo cair RAY*), meaning *Old Square.* Most buildings in the French Quarter, however, look more Spanish than French. Terrible fires swept through the area in 1788 and 1794. At that time, Spain ruled Louisiana, and so the rebuilding favored the Spanish style of architecture. This style can be seen in many homes and other buildings with their lovely, landscaped patios and graceful balconies of lacy iron grillwork.

Several of New Orleans's most historic structures border Jackson Square in the heart of the French Quarter. One landmark, the St. Louis Cathedral, was completed in 1851. It stands between the Presbytère and the Cabildo. The Presbytère, built from 1794 to 1813, was used as a courthouse. The Cabildo, begun in 1795 and completed in 1799, was the seat of the Spanish government in the Louisiana Territory. The United States acquired the territory from France in the Louisiana Purchase of 1803. The official transfer of the land took place in the Cabildo. The Presbytère and the Cabildo are now museums. Fire damaged much of the Cabildo in 1988. However, the museum has been fully restored.

The Pontalba Buildings, two block-long apartment buildings, face each other across Jackson Square. They were built as luxury town houses in 1849 and are among the city's most fashionable residences. The French Quarter is also known for its nightclubs on Bourbon Street and antique shops on Royal Street. It also has a number of restaurants famous for fine food.

New Orleans's main business district lies west of the French Quarter. Large department stores stand along Canal Street, the district's chief shopping area. This broad boulevard is 171 feet (52 meters) wide. The 33-story International Trade Mart rises at the south end of Canal Street. Many firms that deal in foreign trade have offices in the Trade Mart. A public observation deck at the top of the building offers a spectacular view of the city and the Mississippi River.

Many modern high-rise office buildings and hotels line Poydras Street between the riverfront and the gigantic Louisiana Superdome. The 95,427-seat Superdome, the world's largest indoor stadium, is used for sports events, conventions, and trade shows. City Hall stands in the nearby Civic Center.

Residential districts. West of downtown New Orleans is a large residential area known as Uptown. It includes some of the city's oldest neighborhoods. The most famous one is the Garden District, with its majestic old mansions and beautiful gardens. Americans who came to New Orleans after the Louisiana Purchase in 1803 developed the Garden District. Also in Uptown are Tulane University, Loyola University, and 340-acre (138-hectare) Audubon Park.

City Park and a number of attractive communities along the Lake Pontchartrain shore cover much of northern New Orleans. City Park occupies 1,500 acres (607 hectares) and is one of the nation's largest city-owned parks. The New Orleans Museum of Art is in the park. Lake Vista, the oldest community on the lakefront, was laid out during the 1930's. This area remains one of the city's finest examples of urban planning with its ranch-style houses surrounded by a belt of parks. New Orleans Lakefront Airport and the University of New Orleans also lie on the lakefront.

Most of New Orleans's newest neighborhoods have been built in the northeastern part of the city, commonly called New Orleans East. Large-scale development began there during the 1960's.

WORLD BOOK map

New Orleans lies in southeastern Louisiana.

The metropolitan area of New Orleans covers 3,400 square miles (8,806 square kilometers). It extends over eight parishes—Jefferson, Orleans, Plaquemines, St. Bernard, St. Charles, St. James, St. John the Baptist, and St. Tammany. More than a million people, about a third of Louisiana's people, live in this area. New Orleans's largest suburb, Metairie, lies west of the city and has a population of 146,136. Fast-growing suburbs have sprung up along the Mississippi between New Orleans and Baton Rouge with the development of large industries. Suburbs north of Lake Pontchartrain are also growing.

People

African Americans make up more than two-thirds of New Orleans's population. Whites and a small number of Hispanics and Asians account for most of the rest. Many white Orleanians are descendants of European immigrants who came to the city to find opportunity and freedom during the 1800's and early 1900's. Many other Orleanians arrived from Latin-American countries during the 1900's. Large numbers of blacks have lived in the city since the first slaves were brought in the early 1700's. In addition, many free blacks immigrated from the Dominican Republic during the 1600's and 1700's.

The New Orleans metropolitan area has experienced a shift in population common to other major urban cen-

Charming old homes line streets in New Orleans's Garden District. Americans who came to the city after the Louisiana Purchase of 1803 developed this section.

Dennis Cipnic, Black Star

Preservation Hall is one of the many places in New Orleans where fans can still thrill to the sounds of old New Orleans-style jazz. The city's musicians helped give birth to jazz during the early 1900's.

ters in the United States. Since the 1950's, a large number of middle-class white families have moved from the city to the suburbs. As a result of this population shift, wealthy whites and poor blacks now form the largest groups in New Orleans.

Ethnic groups. Nearly all the early African American residents of New Orleans came from Africa as slaves. They worked on farms and plantations in and near the city. In the early 1900's, African American musicians made New Orleans a world-famous center of jazz. Black jazz bands still follow a New Orleans custom and play in black funeral processions to and from cemeteries. See Jazz (Early jazz).

Today, more than 325,000 African Americans live in New Orleans and make up the city's largest ethnic group. Many of them are poor and live in mainly black communities near the downtown area. However, there is a growing African American middle class. Many of these people live in eastern New Orleans.

Other groups of Orleanians include those of Cuban, French, German, Irish, Italian, Mexican, Polish, or Vietnamese ancestry. Many residents who came from Latin America live southeast of the downtown area.

The descendants of New Orleans's early French and Spanish residents are known as *Creoles.* The term *Creole* comes from the Spanish word *criollo,* which means *native to the place.* The Creole influence is still strong in New Orleans. For example, on All Saints' Day (November 1), a citywide holiday that honors the dead, many Orleanians follow the Creole tradition of going to the cemetery in family groups. Creole cooking, a spicy blend of French and Spanish dishes, remains popular in restaurants throughout New Orleans.

Housing. About 40 percent of New Orleans's families own their homes. Most of the rest rent apartments. New high-rise apartment buildings have been erected in various parts of New Orleans. But about half the city's housing was built before 1940. In fact, much of the housing dates from the 1800's. Many of the older homes, especially those in the French Quarter and the Garden District, have been beautifully restored. But much other housing, greatly in need of repair, is neglected because of high repair costs and low personal incomes.

Education. New Orleans has about 140 public schools. About 90 percent of the public school students are blacks. The New Orleans metropolitan area also has about 125 Roman Catholic schools in the city and suburbs. There are also a number of other church-supported and private schools.

The University of New Orleans, the city's largest university, is part of the Louisiana State University system. Tulane University is New Orleans's oldest institution of higher learning. It was founded in 1834. Other universities and colleges in New Orleans include Dillard University; Loyola University New Orleans; New Orleans Baptist Theological Seminary; Notre Dame Seminary Graduate School of Theology; Our Lady of Holy Cross College; Southern University of New Orleans; and Xavier University.

The arts. New Orleans is a leading cultural center of the South. The New Orleans Theatre of the Performing Arts houses the New Orleans Opera House Association. The Louisiana Philharmonic, a symphony orchestra completely owned by its musicians, performs in the Orpheum Theatre.

New Orleans has been known for its jazz ever since the city helped give birth to the music in the early 1900's. Black musicians and a number of white musicians helped to develop jazz in the bars and nightclubs on Basin, Rampart, and other streets in the French Quarter. Today, old New Orleans-style jazz is still played in many places in the city. One of the most famous places

is Preservation Hall, a small building where fans sit on wooden benches or stand to hear jazz concerts.

Le Petit Théâtre du Vieux Carré is one of the city's best-known professional theater companies. The Dashiki Project Theatre is an outstanding black company.

Libraries and museums. The New Orleans Public Library operates a main library and several branches. Tulane University has an outstanding collection of books on Louisiana history. Tulane is also the home of the Amistad Collection, a group of books and other materials about black life and culture. In addition to public and university libraries, the historic New Orleans Collection is one of the finest repositories of material about the development of Louisiana and the South.

The New Orleans Museum of Art has a fine display of Spanish colonial paintings and decorative art. The Louisiana State Museum operates eight historic buildings in New Orleans, including the Cabildo and Madame John's Legacy, a beautifully restored house dating from the early 1700's. Other New Orleans museums include the Moss-Pitot House, a former plantation; the Confederate Memorial Museum; the National D-Day Museum; and the Old U.S. Mint, which features jazz and Mardi Gras memorabilia.

Jean Lafitte National Historical Park and Preserve includes a large area of wetlands and the site of the Battle of New Orleans. A visitor center features displays about the battle, which was the last clash of the War of 1812.

Recreation. New Orleans has over 100 parks. The two largest parks, City Park and Audubon Park, were plantations in the 1800's. City Park includes a bandstand and the 27,000-seat Municipal Stadium. Audubon Park's attractions include a large zoo. The Aquarium of the Americas, a large aquarium, stands in the French Quarter along the Mississippi River. Lake Pontchartrain and other nearby lakes are popular for boating, fishing, and sailing. The Bayou Sauvage National Wildlife Refuge in eastern New Orleans is an appealing outdoor attraction.

The city has two major league professional sports teams. It is the home of the New Orleans Saints of the National Football League and the New Orleans Hornets of the National Basketball Association.

Annual events. Every year, about a million visitors attend New Orleans's exciting Mardi Gras festival in February or March. The celebration climaxes the city's carnival season, which begins in January. Mardi Gras activity lasts about two weeks and ends on Shrove Tuesday, the day before the Christian observance of Lent starts. It features joyful parades and elaborate costume balls sponsored by private carnival organizations known as *krewes.* On Shrove Tuesday, also called Mardi Gras Day, the king of the Rex krewe leads a merry parade of several hundred floats. Brightly costumed riders on the floats toss beads, toys, and imitation gold coins called *doubloons* to eager crowds.

Another popular annual event in New Orleans is the Spring Fiesta, held in April or May. It includes guided tours through charming old houses in the French Quarter and the Garden District. The Jazz and Heritage Festival is another popular spring event. New Orleans hosts the annual Sugar Bowl football game on or near New Year's Day. The game, held in the Superdome, features two of the nation's top college teams.

Social problems. The chief social problems in New Orleans, as in most other large U.S. cities, include poverty, slums, and crime. Nearly a fifth of the city's families are poor. Most of the needy have little education and hold low-paying jobs or are unemployed. Many of the unemployed have not completed high school and lack the skills needed for jobs. Deteriorating housing in low-income areas is a serious problem. Many of the poor are forced to live in overcrowded, run-down housing. The city has been unable to finance much new housing.

High unemployment and crime rates especially trouble the city's black neighborhoods and contribute to racial tension. But New Orleans also has many suc-

Karen A. Yops

A lovely terrace is the setting for this restaurant in New Orleans. Many of the city's restaurants are famous for fine food and feature Creole cooking, a blend of French and Spanish dishes.

St. Louis Cathedral faces Jackson Square in the heart of the French Quarter. The towering spires of the church have made it a New Orleans landmark. The building dates from 1851.

Christopher R. Harris from Katherine Young

Shipbuilding is one of the leading industries in the New Orleans metropolitan area. The Avondale Shipyard of Jefferson Parish, *shown here,* is a major U.S. shipbuilding center.

cessful African Americans working in business, government, and other fields.

Economy

New Orleans's economy depends heavily on shipping and tourism. The Port of New Orleans ranks among the world's busiest seaports. The French Quarter helps attract more than 700 conventions to New Orleans yearly. In addition, the city is one of the South's major centers of business, industry, and transportation.

Trade and finance. The Port of New Orleans handles about 145 million tons (132 million metric tons) of cargo a year. About 5,000 ships from about 60 nations dock at the busy port annually. The chief exports are grain and other foods from the midwestern United States and petroleum products. The leading imports include chemicals, cocoa beans, coffee, and petroleum. The port handles more trade with Latin America than does any other U.S. port.

New Orleans is also a busy port for barges. The barges use the nation's two main inland waterways, the Mississippi River and the Gulf Intracoastal Waterway, which meet at New Orleans. The port of New Orleans handles about 50,000 barges yearly.

The New Orleans metropolitan area is one of the South's chief centers of retail and wholesale trade. It has about 8,500 retail firms and over 2,000 wholesale firms.

The New Orleans area is also a financial center. Many commercial banks and savings and loan associations operate in the area. Their loans help finance business expansion projects and other civic developments. The Sixth Federal Reserve District Bank operates a branch bank in New Orleans.

Industry. The New Orleans metropolitan area has about 1,000 manufacturing plants. They employ about 12 percent of the area's workers and produce more than $1 billion worth of goods yearly.

At the Michoud Assembly Facility, several companies produce equipment for the United States space program. Michoud made the Saturn 5 rocket that launched the Apollo 11 astronauts to the moon in 1969. In the 1980's, a huge new industrial center, the Almonaster-Michoud Industrial District (now called the New Orleans Business and Industrial District), was begun. It was built around the Michoud Assembly Facility. See the *Recent developments* section of this article for more details. The Avondale Shipyard, in Jefferson Parish, is one of the nation's largest shipbuilding centers. Other leading industries in the area make food products, petrochemicals, petroleum products, and primary metals.

Transportation. Barges and oceangoing ships dock at wharves on the Mississippi River, the Inner Harbor Navigation Canal, and the Mississippi River-Gulf Outlet. The Navigation Canal links the Mississippi and Lake Pontchartrain. The 76-mile (122-kilometer) Gulf Outlet gives shippers a 44-mile (71-kilometer) short cut between New Orleans and the Gulf of Mexico.

Louis Armstrong New Orleans International Airport, in the nearby city of Kenner, serves many commercial airlines. Private aircraft use New Orleans Lakefront Airport. Many trucking companies and several passenger and freight rail lines also serve the city. The Lake Pontchartrain Causeway, the world's longest bridge, extends about 29 miles (47 kilometers). It spans the lake and links New Orleans and its northern suburbs.

Communication. New Orleans has one daily newspaper, *The Times-Picayune.* It has the largest circulation of Louisiana's daily newspapers. Several television stations and about 30 radio stations serve the city.

Government

The city has a mayor-council form of government. Voters elect the mayor and the seven members of the City Council to four-year terms. The mayor may serve any number of terms but not more than two in a row.

The mayor appoints a chief administrative officer to help direct the city government. The mayor also plans civic improvements. The council makes the city's laws. The mayor may veto bills passed by the council. However, any bill the mayor vetoes may still become law if at least five council members vote to repass it.

A sales tax is the city government's largest source of local revenue. But New Orleans, like other big cities, does not raise enough money from local taxes to pay for the increasing costs of services and improvements. As a result, the city depends on the state and federal governments for about one-third of its revenue.

New Orleans's flag was adopted in 1918. The three stripes symbolize democracy. The fleurs-de-lis stand for the city's French heritage.

The city seal dates from 1852. The Indians honor the first inhabitants of the New Orleans area. The alligator represents the city's swamps.

History

Chickasaw, Choctaw, and Natchez Indians lived in what is now the New Orleans area before Europeans arrived. In 1682, the French explorer René-Robert Cavelier, Sieur de La Salle, sailed down the Mississippi River from the Great Lakes region. He claimed the entire Mississippi Valley for France.

French and Spanish rule. Sieur de Bienville founded New Orleans in 1718. In 1722, he made it the capital of the French colony of Louisiana, which covered the central third of the present-day United States.

In 1762, King Louis XV of France gave Louisiana to his cousin, King Charles III of Spain. The French Orleanians disliked the first Spanish governor of Louisiana, Antonio de Ulloa, and drove him from the city in 1768. But in 1769, soldiers arrived from Spain and restored Spanish rule in New Orleans.

The worst fire in what is now Louisiana broke out in New Orleans on March 21, 1788. It started in a house on Chartres Street and destroyed over 850 buildings. Rebuilding was underway when a fire swept through 200 more structures in 1794.

In 1800, France secretly regained the Louisiana region from Spain but did not reveal the fact until March 1803. The next month, France sold Louisiana to the United States. On November 30, in preparation for the region's official transfer, the French took down the Spanish flag that still waved over New Orleans and raised the French flag. On December 20, the American flag became the third flag to fly over the city in less than a month.

The early 1800's. In 1805, New Orleans was incorporated as a city. Louisiana joined the Union in 1812, and New Orleans became the state capital. Also in 1812, the steamboat *New Orleans* arrived at New Orleans after sailing down the Ohio and Mississippi rivers from Pittsburgh. It was the first steamer to navigate the Mississippi. River trade soon boomed at New Orleans.

During the War of 1812, British troops tried to capture New Orleans. The British sought the aid of Jean Laffite, leader of a pirate band based near the city. But Laffite joined the American forces that were defending New Orleans. General Andrew Jackson commanded the U.S. troops. Jackson's army and Laffite's pirates defeated the British in the Battle of New Orleans on Jan. 8, 1815. See **War of 1812** (The needless battle).

After the war, river trade brought increasing wealth to New Orleans. The city thrived as a cotton port and slave-trading center. The state capital was moved to Donaldsonville in 1830. But New Orleans again served as the capital from 1831 until 1849, when Baton Rouge became the capital. New Orleans held its first Mardi Gras celebration in 1838.

The *Paris of America*. By 1840, New Orleans had a population of 102,193 and was the nation's fourth largest city. In the mid-1800's, it attracted thousands of immigrants from Germany and Ireland. Professional opera and theater companies thrived in New Orleans during this period, and the lively and glamorous city became known as the *Paris of America*.

During the mid-1800's, New Orleans also gained a reputation as an unhealthy city. In 1832, a yellow fever epidemic swept through the city, taking about 7,700 lives. Doctors did not know that mosquitoes, which thrived in the swampy New Orleans area, were the chief carriers of the disease. The worst yellow fever epidemic in United States history hit New Orleans in 1853. It killed more than 11,000 people.

The Civil War and Reconstruction. In 1861, Louisiana withdrew from the Union and joined the Confederate States against the North in the Civil War. New Orleans's importance as a port made it a chief target of the Union forces. In April 1862, a Union fleet commanded by Captain David Farragut sailed up the Mississippi from the Gulf of Mexico. After bombarding several forts, the fleet reached New Orleans and forced it to surrender on May 1. General Benjamin F. Butler took charge of the city and made it the Union capital of Louisiana.

Union troops remained in New Orleans during the Reconstruction period after the war. Blacks and North-

Lithograph (1851) by T. H. Muller; Mariners' Museum, Newport News, Virginia. (Katherine Young)

New Orleans's riverfront served as a chief port for steamboats that traveled on the Mississippi River in the mid-1800's. The booming river trade of this period brought great wealth to New Orleans, which thrived as a cotton port.

erners then gained control of the city government. In 1866, a riot broke out between whites and blacks in New Orleans over a voting dispute. The riot resulted in the deaths of about 50 people—most of them blacks—and increased racial tension in the city. Widespread corruption in government and rising city debts also troubled New Orleans during the Reconstruction period. In 1877, the U.S. government withdrew its troops from the city.

During the late 1800's, New Orleans struggled to rebuild its economy. Trade at the port had slumped sharply after the Civil War, when the coming of the railroads to the Mississippi Valley caused steamboat traffic to decline. In 1878, another yellow fever epidemic killed more than 3,800 Orleanians.

Civic improvements. Port activity increased rapidly after 1879. That year, U.S. Army engineers directed by James B. Eads deepened the mouth of the Mississippi River. This project enabled oceangoing ships to reach New Orleans.

By 1900, New Orleans's population had reached about 287,000. It continued to climb steadily during the early 1900's, when thousands of Italian immigrants arrived. In 1905, New Orleans officials adopted a program to combat mosquitoes by destroying their breeding areas. This program ended the threat of yellow fever in the city.

By 1920, African American Orleanian musicians had helped New Orleans win fame as a jazz center. These musicians included Louis Armstrong, Jelly Roll Morton, and King Oliver.

During the 1920's, the development of tugboats powerful enough to push long lines of barges on the Mississippi River greatly increased trade at New Orleans's port.

An annual threat of floods from the Mississippi was largely ended with the completion of the Bonnet Carré Spillway in 1932. This channel connects the river to Lake Pontchartrain west of New Orleans. When floods threaten, water from the river is forced through the spillway and the lake to the Mississippi Sound.

In 1946, deLesseps S. Morrison, a Democratic reformer, was elected mayor of New Orleans. He served as mayor until 1961 and began a series of long overdue civic projects. In his first major accomplishment, Morrison combined five railroad stations into one, the Union Passenger Terminal. It opened in 1954. Other projects included the opening of the Greater New Orleans Bridge (now part of the Crescent City Connection) in 1958 and completion of the Civic Center in 1959.

Social changes. During the 1960's, far-reaching social changes occurred in New Orleans. In 1960, black students entered all-white public elementary schools in New Orleans for the first time since the Reconstruction period. The city's libraries, restaurants, and other public facilities also became integrated during the decade.

Large residential developments began in New Orleans East during the 1960's. In the mid-1960's, the production of rockets at the Michoud Assembly Facility made New Orleans a space age industrial center.

New construction. The Louisiana Superdome opened in 1975. It led to the building of several hotels and motels in downtown New Orleans. A World's Fair was held in New Orleans in 1984.

Development of a 7,000-acre (2,800-hectare) business and industrial park in eastern New Orleans took place in the 1980's and 1990's. The park, reserved for business construction only, created jobs in the area.

Political developments. In 1977, New Orleans voters elected Ernest N. (Dutch) Morial mayor. He was the city's first African American mayor. He was reelected in 1982 and remained in office until 1986. Marc H. Morial, a son of Ernest Morial, served as mayor from 1994 to 2002.

New South Wales is the oldest state in Australia. More people live in New South Wales than in any other Australian state. The state is located on the east coast of the Australian continent. Sydney is the capital and largest city of New South Wales (see **Australia** [political map]).

The land. New South Wales has an area of 309,500 square miles (801,600 square kilometers). Its coast consists of many rugged cliffs. Some of these cliffs form rocky headlands that enclose good harbors. Sandy beaches line parts of the coast. To the west, a narrow expanse of fertile land leads to the mountains of the Great Dividing Range. The highest peak in Australia, 7,310-foot (2,228-meter) Mount Kosciuszko, is part of this range. Grassy plains lie west of the mountains.

The state has a mild climate. Temperatures average about 50 °F (10 °C) in July and 75 °F (24 °C) in January. Average annual rainfall ranges from 80 inches (200 centimeters) in the eastern highlands to less than 10 inches (25 centimeters) on the western plains.

The people. Most of the 6,038,696 people of New South Wales are of British descent. However, many people from other parts of Europe migrated to New South Wales after World War II ended in 1945, and many Asian immigrants have arrived since the 1970's. About 100,000 Aborigines, descendants of the earliest inhabitants of Australia, live in the state. About three-fifths of the state's population lives in or near Sydney.

Economy. Farmland lies on the coastal plain, in the foothills of the Great Dividing Range, and on the plains west of the mountains. Irrigation systems supply water to many inland areas. Grazing is an important part of the state's rural income. About a third of Australia's sheep are raised in New South Wales. Wheat accounts for almost half the crop production in the state. Other products include bananas and citrus fruits, other grains, potatoes, sugar, and tobacco.

About a fifth of the value of Australia's mineral production comes from New South Wales. Coal ranks as the state's leading mineral product. Australia's first gold discovery was made in New South Wales in 1851. Other important minerals in the state include copper, iron, lead, magnesite, opals, silver, tin, and zinc.

Most of the workers in New South Wales are employed in manufacturing. The state has more than 10,000 factories, chiefly in Sydney, Newcastle, and Wollongong. The leading manufactured goods include chemicals, clothing, fertilizers, glassware, machinery, paper, raw and processed steel and copper, processed foods, and textiles. The state's major exports include coal; raw wool and cotton; such cereals as wheat, rice, and barley; and meat. It's chief imports are manufactured goods.

Education. Children from 6 through 15 years of age must attend school. About 760,000 students attend state-operated public schools, and about 264,000 children attend nongovernmental schools. The University of Sydney has about 18,000 students. Other universities of the state include Macquarie University, the University of Newcastle, the University of New England, and the University of New South Wales.

Government. A governor with limited powers represents the British monarch in New South Wales. The actual head of state is the premier. The premier is assisted by a Cabinet of ministers, who head government departments. The state parliament has a 42-member Legislative Council and 93-member Legislative Assembly.

History. In 1770, the British navigator James Cook and his crew aboard the *Endeavour* became the first Europeans to reach the area. In 1788, Captain Arthur Phillip landed at Port Jackson in New South Wales with a group of convicts and soldiers to guard them. They founded the first white settlement in Australia. At that time, New South Wales was the name used for the eastern part of Australia and included land that is now the states of Queensland, Victoria, and part of South Australia. Free settlers began to arrive in the early 1800's. Convict immigration to New South Wales ended in 1840. In 1851, the British gave Australian colonies the right to govern themselves in most matters. The colony became completely self-governing in 1856.

In 1901, New South Wales became one of the six states of the Commonwealth of Australia. In 1911, the state began a transfer of land to the federal government to form the Australian Capital Territory, which covers 911 square miles (2,359 square kilometers). Canberra, the national capital, is in the territory. John Goode

New Sweden was the only Swedish colony in America. It extended along the Delaware River from the mouth of Delaware Bay to about what is now Trenton, N.J. Swedish settlers founded the colony in 1638 and built Fort Christina at what is now Wilmington, Del. New Sweden was a mildly successful fur-trading colony. About 350 farmers and fur traders lived there. The Dutch protested the existence of New Sweden because the land lay within the Dutch territory of New Netherland. In 1655, Peter Stuyvesant, governor of New Netherland, led a military expedition against New Sweden and forced its surrender. Oliver A. Rink

Australian Information Service

New Testament is the second part of the Christian Bible. The word *testament* means *covenant* or *agreement.* Christians call the first part of the Bible the Old Testament because it is a record of the covenant made by God with the people of Israel long before the writing of the New Testament. The New Testament is the record of a new covenant made by God with humanity through the life, death, and Resurrection of Jesus Christ.

Contents of the New Testament

Books. The New Testament is about one-fourth the length of the Old Testament and consists of 27 individual writings called *books.* The first four books are the Gospels according to Matthew, Mark, Luke, and John. The Gospels are four different accounts of the words and deeds of Jesus. The authors wrote the Gospels to express their faith in Jesus.

The Acts of the Apostles is a continuation of the Gospel of Luke. It tells the story of the expansion of the early church. Twenty-one documents called *Epistles* (letters) follow. Thirteen of the Epistles claim to be letters from Saint Paul. Some of the remaining eight are anonymous. Others claim to be letters from the early church leaders Saint Peter, Saint James, and Saint Jude. The New Testament ends with Revelation, also called the Apocalypse.

The 27 books make up the *canon* of the New Testament—that is, the books that Christians consider to be authoritative scripture. Early Christians produced many other writings that varied in value and authority. These included fanciful gospels and acts designed to fill in the details of the life of Jesus and His apostles. Such writings are now known as *apocryphal* works. In addition, the early church fathers wrote letters, defenses of Christian faith, and refutations of heresy. By A.D. 400, church scholars regarded the present books of the New Testament as authoritative scripture. Later, church councils ratified these decisions regarding the canon.

Writing the New Testament. The books of the New Testament were written during the period from about A.D. 50 to about 125. The original language of the New Testament is the common Greek widely used at this time. The Greek in the New Testament includes some Hebrew or Aramaic phrases and idioms. These borrowed words may reflect the use of Hebrew or Aramaic by Jesus and His earliest followers.

Dating the New Testament

It is impossible to give definite dates for all the events in the New Testament, just as it is impossible to give definite dates for many other incidents in ancient history. But scholars have been able to set approximate dates by connecting Bible narratives with known historical facts.

The birth of Jesus. Matthew 2:1 indicates that Jesus was born while Herod the Great ruled Palestine (see also Luke 1:5, 26). Because Herod died in 4 B.C., this is the latest possible date for the birth of Jesus. Our current system of dating events from the birth of Jesus was introduced in the A.D. 500's. The person who created the system miscalculated the year of Jesus's birth. The Christian Era is indicated by the Latin words *anno Domini,* which mean *in the year of our Lord.* The abbreviation A.D. is written before the year.

Nothing in the Bible states the day or month of Jesus's birth. However, December 25 comes about the time of the year called the winter *solstice.* At this time, the hours of daylight begin to lengthen as winter becomes spring. The date serves as a symbol of the new life that came to the world when Jesus was born.

The public ministry of Jesus. According to Luke 3:1, John the Baptist began preaching in the 15th year of the Emperor Tiberius, which would be A.D. 28. Because all four Gospels agree that Jesus's public ministry began after that of John, A.D. 28 is the earliest possible date for the start of Jesus's ministry. According to Luke 3:23, Jesus was about 30 years old at this time. None of the Gospels state how long Jesus's ministry lasted. The Gospels of Matthew, Mark, and Luke refer to only one celebration of the annual Passover holiday during Jesus's adult life,

Detail of *The Conversion of Saint Paul* (1542-1545), a fresco by Michelangelo in the Pauline Chapel in the Vatican (SCALA/Art Resource)

An account in the New Testament describes Saint Paul's conversion to Christianity while he was on the road to Damascus.

the one at the time of His Crucifixion. This reference seems to imply that Jesus's public ministry lasted about one year. However, the Gospel of John mentions three Passovers, implying that Jesus's ministry lasted about three years.

The Crucifixion. All the Gospels imply that Jesus was crucified on a Friday. All except John tell that this Friday was the day of Passover. According to John, the Crucifixion occurred on the day before Passover, and in that year Passover fell on the Sabbath (Saturday in the Jewish religion). If John is correct, the Crucifixion probably occurred in either A.D. 30 or 33, because Passover fell on the Sabbath in these two years.

The life of Paul. According to Acts 18:12-17, Paul was put on trial before the Roman governor Gallio in Corinth. An inscription found at Delphi enables historians to identify A.D. 51-52 as the year Gallio held office and thus the year Paul appeared before him. With this date as a starting point, historians can use other information in Acts and the Epistles of Paul to determine dates for other events in Paul's life.

Paul's conversion to Christianity occurred shortly after the Crucifixion and Resurrection of Jesus. In the midst of his extensive missionary journeys, Paul met with the leaders of the Jerusalem church in A.D. 48 (Galatians 2:1-10; Acts 15:1-29). Paul was arrested in Jerusalem in about A.D. 57 while Felix was the Roman governor of Judea. When Festus became governor two years later, Paul was taken to Rome, where he remained in custody for two more years.

Paul probably was killed during the reign of the Emperor Nero (A.D. 54-68). Historians know that Nero put a number of Christians to death after the burning of Rome to turn people's suspicions away from himself.

Critical studies of the New Testament

Scholarly study of the New Testament is sometimes called criticism. Biblical criticism is divided into two classes, textual criticism and interpretative criticism.

Textual criticism. The original manuscripts of the books of the New Testament, as they were written by the early Christians, have all been lost. Only copies remain. The earliest copies date from the A.D. 100's. Thousands of later copies exist. Many variations of wording occur in the old copies, though the variations in the Greek manuscript rarely affect the meaning of a passage. However, these differences make it difficult to determine the original wording of some passages.

Textual criticism is concerned with the recovery of the author's own wording, before copies were made. The process of making copies led to errors, most of which were accidental. With much research and comparison, scholars have put together the many variations of wording found in the copies of the Greek New Testament.

Textual critics also include the variations that underlie the early translations of the New Testament into other languages, such as Latin, the Syriac language of Syria, and the Coptic language of Egypt. In addition, critics include in their research quotations from the New Testament used by early church fathers.

Efforts to determine original wording through careful study and comparison have sometimes met with opposition. But most church officials now accept such studies as a necessary first step in determining the purpose and the original meaning of the Biblical writings.

Interpretative criticism covers a broader field than textual criticism. Interpretative critics analyze the Bible by comparing one passage with another. They also compare statements in the Bible with literary and historical works of the same time. They examine the literary form of Biblical writings. Through such studies, they attempt to establish what the Biblical writings meant to their original authors and readers, and what they mean for Christians today.

Interpretative critics often find a different meaning in the Bible than those who have not studied it in this way. Such an understanding of the Bible is unsettling for some Christians. Some interpretations advanced by critics have been rejected as incompatible with Christian faith. However, most Christians believe that many good results have come from a wise and unprejudiced study of the Bible. The most respected schools of religious studies teach the New Testament in the light of all that modern learning and scholarship have achieved.

New Thought is a philosophical and religious movement that originated in the United States during the mid-1800's. Supporters of New Thought believe that the human mind is superior to all material conditions and circumstances. They assert that each person is an individualized center of God, and that God is immediately accessible to people through the power of the mind. Accordingly, a person can solve any problem by properly applying mental force. New Thought resembles the ideas of Ralph Waldo Emerson, an American transcendentalist philosopher (see **Transcendentalism**).

Phineas Quimby and his principal disciples, Julius Dresser and Warren Felt Evans, were early leaders of the New Thought movement. They developed theories of mental healing. They argued that sickness is a wrong belief and can be eliminated by channeling the power of the mind toward the correct idea of health. Mary Baker Eddy, the founder of Christian Science, was influenced by Quimby's ideas. Susan M. Setta

New town. See City (Future cities); **City planning** (Building new communities); **Tapiola.**

New Westminster (pop. 54,656) is a city in southwestern British Columbia. It lies on the Fraser River, 12 miles (19 kilometers) southeast of downtown Vancouver. For the location of New Westminster, see **British Columbia** (political map).

The Royal Columbian Hospital is New Westminster's largest employer. Other employers include mills that produce softwood lumber, pulp and paper, and shingles. Many of New Westminster's people work in nearby Vancouver, British Columbia's largest city.

The British Army's Royal Engineers began laying out

the city in 1858. The city was founded in 1859 and was named Queensborough, after Queen Victoria of Britain. Later in 1859, the queen renamed it New Westminster, after the English town of Westminster (now part of Greater London). New Westminster served as the capital of the colony of British Columbia from 1859 to 1868. In 1860, it became British Columbia's first incorporated city. Fire destroyed the city's main business district in 1898. The district was soon rebuilt. New Westminster has a mayor-council form of government. Graeme Wynn

New World is another name for the Western Hemisphere, which includes the continents of North America and South America. See **Old World; Hemisphere.**

New Year's Day is the first day of the calendar year. People in almost every country celebrate this day as a holiday. The celebrations are both festive and serious. Many people make New Year's resolutions to break bad habits or to start good ones. Some think about how they have lived during the past year and look forward to the next 12 months.

Early customs. Many ancient peoples started the year at harvesttime. They performed rituals to do away with the past and purify themselves for the new year. For example, some people put out the fires they were using and started new ones.

In early times, the ancient Romans gave each other New Year's gifts of branches from sacred trees. In later years, they gave gold-covered nuts or coins imprinted with pictures of Janus, the god of gates, doors, and beginnings. January was named after Janus, who had two faces—one looking forward and the other looking backward. In addition to giving gifts to each other, the Romans also brought gifts to the emperor. The emperors eventually began to demand such gifts. But the Christian church outlawed this custom and certain other pagan New Year's practices in A.D. 567.

The ancient Persians gave New Year's gifts of eggs, which symbolized productiveness. The Celtic priests of what is now England gave the people branches of mistletoe, which was considered sacred.

The Celts took over many New Year's customs from the Romans, who invaded the British Isles in A.D. 43. By the 1200's, English rulers had revived the Roman custom of asking their subjects for New Year's presents. Common presents included jewelry and gold. Queen Elizabeth I acquired a large collection of richly embroidered and jeweled gloves through this custom. English husbands gave their wives money on New Year's Day to buy pins and other articles. This custom disappeared in the 1800's. However, the term *pin money* still means small amounts of spending money.

Many American colonists in New England celebrated the new year by firing guns into the air and shouting. They also visited taverns and houses to ask for drinks. Other colonists attended church services. Some people held open house, welcoming all visitors and feeding them generously.

Another old custom involved using the Bible to predict what would happen in the new year. People chose a passage of the Bible at random. They then applied the passage to the coming months of the new year.

Modern customs on New Year's Day include visiting friends and relatives; giving gifts; attending religious services; and making noise with guns, horns, bells, and other devices. Children in Belgium write their parents New Year's messages on decorated paper. The children read the messages to their families on New Year's Day.

The Chinese New Year begins between January 21 and February 20. The celebration lasts four days. On the last night, people dress as dragons to frighten and delight the children. In Japan, many people worship on New Year's Day.

San Francisco Visitors Bureau

A Chinese New Year celebration in San Francisco features a colorful dragon costume. The Chinese New Year begins between January 21 and February 20. The holiday lasts four days.

In the United States, many people go to New Year's Eve parties. Crowds gather in Times Square in New York City, on State Street in Chicago, and in other public places. At midnight, bells ring, sirens sound, firecrackers explode, and everyone shouts, "Happy New Year!" People also drink a toast to the new year and sing "Auld Lang Syne" (see **Auld Lang Syne**).

On New Year's Day, many people in the United States visit relatives, attend religious services, or watch football games on television. Some people attend parades, such as the Tournament of Roses Parade in Pasadena, California, and the Mummers' Parade in Philadelphia.

The date of New Year's. The early Roman calendar used March 1 as New Year's Day. Later, the ancient Romans made January 1 the beginning of the year.

During the Middle Ages, most European countries used March 25, a Christian holiday called Annunciation Day, to start the year. By 1600, many Western nations had adopted a revised calendar called the Gregorian calendar. This calendar, the one used today, restored January 1 as New Year's Day. Britain and its colonies in America adopted it in 1752.

Many people celebrate the new year on dates established by their religion. For example, the Jewish New Year, a solemn occasion called Rosh Ha-Shanah, is observed during September or early October (see **Rosh Ha-Shanah**). Hindus in different parts of India celebrate the new year on various dates. Muslims use a calendar that has 354 days in most years. As a result, the Muslim New Year falls on different dates from year to year on the Gregorian calendar. Robert J. Myers

W. D. Murphy, Shostal

The Hudson River Valley at Bear Mountain Bridge in eastern New York is one of the state's many scenic areas. Much of the state is covered by wooded, rolling hills and sparkling lakes.

New York *The Empire State*

New York is a leading center of banking, communication, and finance in the United States. It is also a leader in wholesale and retail trade and in manufacturing. According to the 2000 census, New York ranked as the nation's third-largest state in population. Only California and Texas had more people. The capital of New York is Albany.

Much of the state's greatness lies in huge, exciting New York City. New York City is the largest city in the United States, and it ranks as one of the largest cities in the world. It is one of the world's leading centers of business. Its large number of theaters, museums, and musical organizations make it a major cultural center. New York City is a busy seaport. In its harbor stands the Statue of Liberty, long a symbol of freedom to people in all parts of the world. As the headquarters of the United Nations, New York City can be called the "capital of the world."

The contributors of this article are Adam W. Burnett, Associate Professor of Geography at Colgate University, and Milton M. Klein, Editor of The Empire State: A History of New York.

The state's factories turn out an incredible variety of products, from industrial machinery to fine jewelry. New York state is a leading producer in the United States of chemicals, photographic equipment, heating and cooling machinery, computer microchips, electronic components, and bakery products. New York City ranks as the largest center of printing and publishing in the nation.

In addition to New York City, several other cities in the state are important centers of industry and trade. These cities include Albany, Buffalo, Rochester, and Syracuse. However, New York is not just a state of business and industry. It is also a land of fertile river valleys, forested hills, tall mountains, and sparkling lakes. New York's many scenic attractions draw millions of tourists each year. Niagara Falls, the state's most magnificent natural wonder, is a chief attraction. New York City is also a major tourist center.

New York was one of the original 13 states. Henry Hudson, an English explorer sailing under the Dutch flag, claimed the New York region for the Netherlands in 1609. The Dutch named the region *New Netherland.* On Manhattan Island, the Dutch established New Amster-

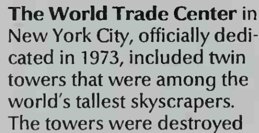
The Avenue of the Americas runs through the center of Manhattan in New York City, the largest city in the United States.

Interesting facts about New York

WORLD BOOK illustrations by Kevin Chadwick

Uncle Sam



"Uncle Sam," the national symbol of the United States, originated in Troy. Samuel Wilson had a meat-packing business in Troy when the War of 1812 broke out. His company received a large contract to supply meat for United States troops. These shipments went out in barrels marked "U.S." for *United States.* However, the abbreviation was not yet common and people asked what it meant. They were jokingly told that U.S. stood for *Uncle Sam.* The nickname eventually came to personify the nation. In 1961, Congress adopted a resolution recognizing Samuel Wilson as the person who inspired the Uncle Sam symbol.

Radio City Music Hall

Radio City Music Hall in New York City is the world's largest indoor theater. The hall, home of the famous dancing Rockettes, has a seating capacity of 5,900.

The first escalator was manufactured by the Otis Elevator Company of New York City in 1899. It was exhibited at the Paris Exposition in 1900. In 1901, the escalator was returned to the United States and installed in a building in Philadelphia.

The World Trade Center in New York City, officially dedicated in 1973, included twin towers that were among the world's tallest skyscrapers. The towers were destroyed on Sept. 11, 2001, in the worst terrorist attack in U.S. history.

dam, which later became New York City. The English took control of New Netherland in 1664. They renamed it New York in honor of the Duke of York, a brother of England's king, Charles II.

About a third of all the battles of the Revolutionary War in America (1775-1783) were fought in New York. New York City served as the capital of the United States from 1785 to 1790. George Washington took the oath of office there as the first president of the United States. In the early 1800's, New York began its great era of canal and railroad building. By 1850, New York ranked as the leading manufacturing state.

By 1810, New York had become the most populous state in the United States. New York held that position until the 1960's, when California overtook it in population. During the 1990's, Texas also passed New York in population.

New York's nickname is the *Empire State,* which may have originated in a remark made by George Washington. Washington once called New York the "seat of the empire." New York is also known as the *Excelsior State. Excelsior,* a Latin word meaning *ever upward,* is the state motto.

Augusts Upitis, Shostal

The Empire State Plaza in Albany includes the State Capitol, *center,* and other government buildings.

New York in brief

Symbols of New York

The New York coat of arms appears on both the state flag and the state seal. On the arms, a shield displays a New York landscape with ships on a river, mountains, and a rising sun. A bald eagle perches on a globe above the shield. A figure representing Liberty stands to the left. The figure on the right symbolizes Justice. The flag was adopted in 1909, and the seal was adopted in 1882.

State flag

State seal

New York (brown) ranks 30th in size among all the states and is the largest of the Middle Atlantic States (yellow).

The State Capitol is in Albany, New York's capital since 1797. Kingston, Poughkeepsie, and New York City served as temporary capitals between 1777 and 1797.

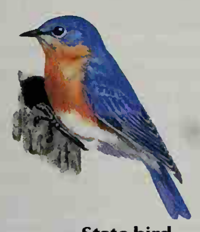
General information

Statehood: July 26, 1788, the 11th state.
State abbreviations: N.Y. (traditional); NY (postal).
State motto: *Excelsior* (Ever Upward).
State song: "I Love New York." Words and music by Steve Karmen.

Land and climate

Area: 49,112 mi² (127,200 km²), including 1,888 mi² (4,891 km²) of inland water but excluding 4,877 mi² (12,632 km²) of Great Lakes and coastal water.
Elevation: *Highest*—Mount Marcy, 5,344 ft (1,629 m) above sea level. *Lowest*—sea level along the Atlantic Ocean.
Coastline: 127 mi (204 km).
Record high temperature: 108 °F (42 °C) at Troy on July 22, 1926.
Record low temperature: −52 °F (−47 °C) at Old Forge on Feb. 18, 1979.
Average July temperature: 69 °F (21 °C).
Average January temperature: 21 °F (−6 °C).
Average yearly precipitation: 36 in (99 cm).

Important dates



1609 Henry Hudson explored the Hudson River.

1625 Dutch settlers began building New Amsterdam (New York City).

1788 New York became the 11th state on July 26.

1825 The Erie Canal was opened, linking the Hudson River and the Great Lakes.

Sources of information

For information about tourism, write to: New York State Division of Tourism, P.O. Box 2603, Albany, NY 12220-0603. The Web site at www.iloveny.com also provides information.
For information on the economy, write to: New York State Department of Economic Development, 30 S. Pearl Street, Albany, NY 12245.
The state's official Web site at www.state.ny.us also provides a gateway to much information on New York's economy, government, and history.

1952 Construction of United Nations Headquarters in New York City was completed.

1960 The New York State Thruway (now the Governor Thomas E. Dewey Thruway) was completed.

1986 New York voters approved a bond act to finance environmental projects, especially the cleaning up of hazardous waste sites.

2001 The twin towers of the World Trade Center in New York City were destroyed in the worst terrorist attack in U.S. history.

People

Population. The 2000 United States census reported that New York had 18,976,457 people. The population of the state had increased about $5\frac{1}{2}$ percent over the 1990 figure, 17,990,455.

About 92 of every 100 of New York's people live within the state's metropolitan areas (see **Metropolitan area**). Three of the state's 13 metropolitan areas have populations of 1 million or more. These areas are Nassau-Suffolk, New York, and Rochester. For a complete list and populations of these areas, see the *Index* to the political map of New York.

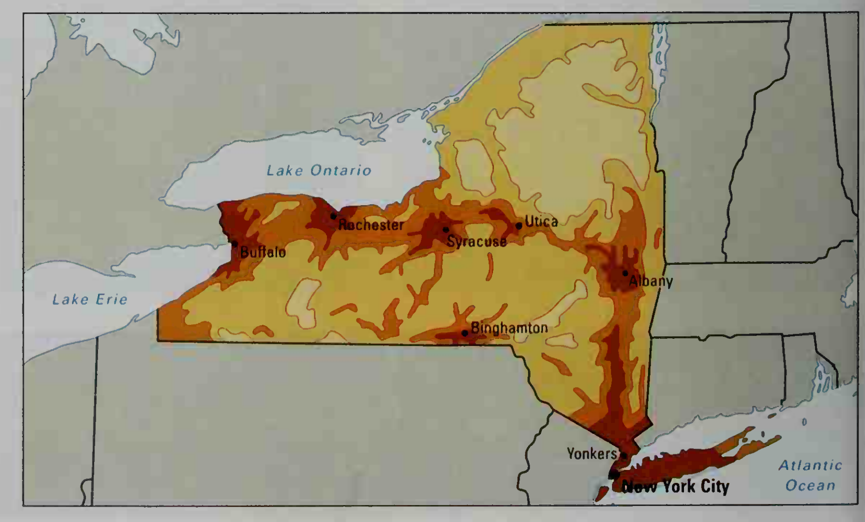
New York City is the largest United States city in population. Its metropolitan area ranks as the country's second largest, after the Los Angeles metropolitan area. New York City and its metropolitan area are among the world's largest cities in population. The 2000 United States Census reported that New York City had 8,008,278 people, and that its metropolitan area had 9,314,235 people. Four other cities in New York with more than 100,000 people are, in order of size, Buffalo, Rochester, Yonkers, and Syracuse.

New York, especially New York City, has long had a diverse population. Here, peoples of many countries and various ethnic groups have settled and adopted a common culture, while retaining many of their own customs. About 16 of every 100 people were born in another country. One or both parents of a fifth of the American-born New Yorkers were born in other countries. The largest groups born in other lands, in order of size, came from the Dominican Republic, Italy, Jamaica, China, the former Soviet Union, Germany, Poland, and Haiti. Many Puerto Ricans have arrived since the end of World War II in 1945. About 1 million Puerto Ricans live in New York City. More than 3 million African Americans live in New York—more than in any other state.

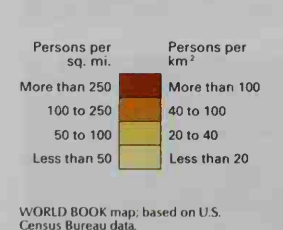
Schools. In 1784, the New York Legislature established an agency called the University of the State of New York. This agency controls and supervises the educational system. The University of the State of New York is not a university in the usual sense of the word. A 16-member board of regents governs the university. The Legislature elects the regents to five-year terms. The regents receive no pay for serving on the board. The board has sweeping powers over all education in the state—elementary, secondary, and higher education—private and public. Its powers include setting educational standards, distributing public funds, awarding scholarships, and incorporating colleges and universities.

The powers and duties of the regents are administered by the State Education Department. The state commissioner of education heads the department. The regents appoint the commissioner for an indefinite term. In 1948, the Legislature established the State University of New York. This statewide university system has one of the largest enrollments of any university in the United States. Headquarters of the system are located in Albany.

The State Education Department, responsible to the board of regents, supervises the state's local public school districts. Each district has its own school board. Children from age 6 through 15 must attend school. For the number of students and teachers in New York, see **Education** (table).



Libraries. The first libraries in New York were privately owned. In 1698, 1713, and 1730, clergymen gave books to the city for a public library. However, no library was established, and the books were destroyed during the Revolutionary War in America (1775-1783). The first circulating library was the New York Society Library, founded in New York City in 1754 and still in existence.



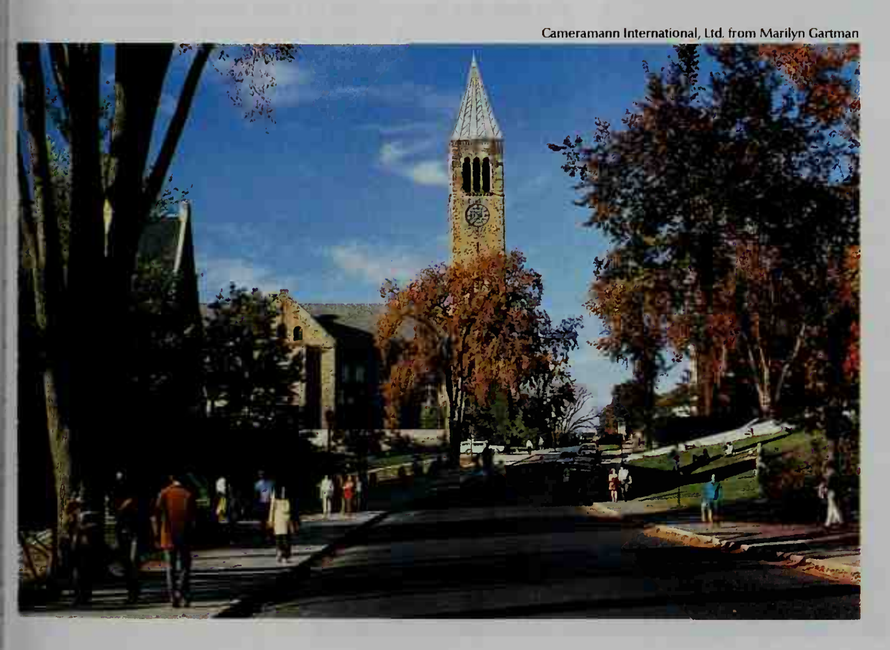
Today, the state has hundreds of public libraries, including central city libraries and their branches. The New York Public Library located in New York City includes research libraries and a large number of branch libraries. This library system is one of the largest in the United States.

Columbia University in New York City has one of the largest collections among the state's college and university libraries. Other large college and university libraries include those at Cornell University located in Ithaca; the four centers of the State University of New York, located in Albany, Binghamton, Buffalo, and Stony Brook; and Syracuse University. The Sibley Musical Library of the University of Rochester has one of the few library buildings in the United States devoted entirely to music.

Population density

The New York City area is New York's most thickly populated region by far. The area between Albany and Buffalo is also heavily populated. Northern New York has relatively few people.

WORLD BOOK map; based on U.S. Census Bureau data.



Universities and colleges

This table lists the universities and colleges in New York that grant bachelor's or advanced degrees and are accredited by the Middle States Association of Colleges and Schools.

Cameramann International, Ltd. from Marilyn Gartman

Cornell University's main campus is located in Ithaca. The Uris Library and McGraw Tower, *center,* stand on the main quadrangle of the College of Arts and Sciences.

New York's numerous special libraries include the Grosvenor Collection in the Buffalo and Erie County Public Library, which is an outstanding reference library; the Morgan Library in New York City, which has an excellent collection of rare manuscripts and early books; and the Frick Art Reference Library, also in New York City.

The New York State Library was founded in Albany in 1818. The state library houses a comprehensive collection on New York history, including records of the early Dutch colonists.

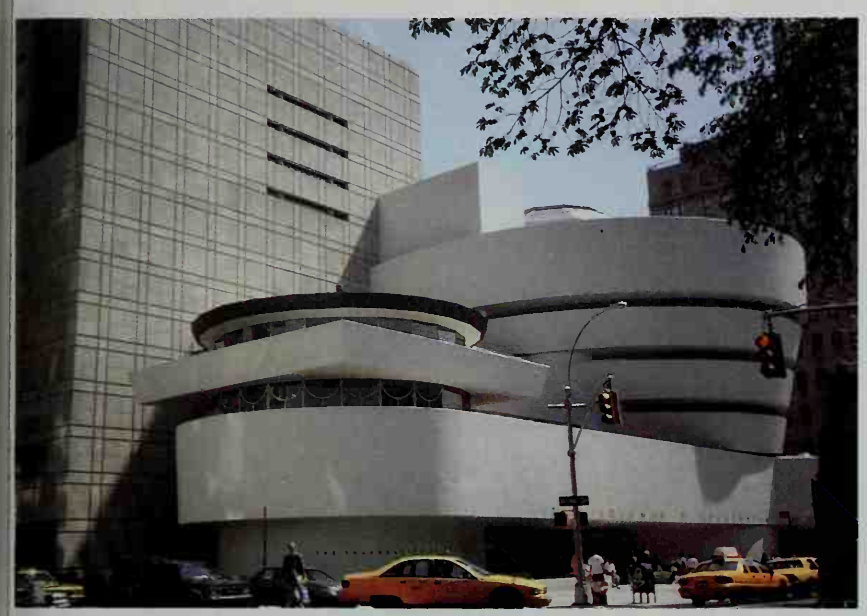
In addition, the New York State Library holds a number of important national documents. These holdings include autographs of all the signers of the Declaration of Independence, the preliminary Emancipation Proclamation, and George Washington's farewell address.

National Baseball Hall of Fame and Museum

The National Baseball Hall of Fame and Museum is located in Cooperstown. The institution pays tribute to great players and features exhibits on the history of the game.

New York State Museum

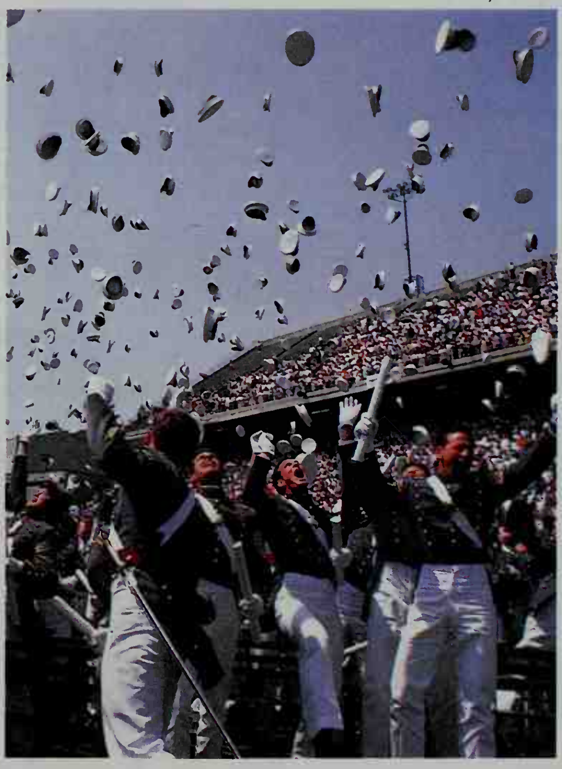
The New York State Museum in Albany includes exhibits on New York's history. This exhibit re-creates a scene from a New York City tenement neighborhood in the early 1900's.



Sepp Seitz, Woodfin Camp, Inc.

The Juilliard School in New York City is a leading school for the performing arts. Courses of study include music, dance, and drama.

Museums. The New York State Museum, founded in Albany in 1836, is one of the oldest state museums in the nation. The regents of the University of the State of New York supervise this museum. The museum's collections deal with natural history, science, and the art and history of the state.



The Metropolitan Museum of Art in New York City is the largest art museum in the United States. The state's other outstanding museums include the Museum of Modern Art, the American Museum of Natural History, and the Guggenheim Museum, all in New York City; and the National Baseball Hall of Fame and Museum and the Farmers' Museum and 19th Century Village, both located in Cooperstown. The George Eastman House International Museum of Photography and Film in Rochester contains an outstanding collection of photographs.

Claus Dyrlund

The Guggenheim Museum in New York City displays works of art in an unusual circular building designed by Frank Lloyd Wright. Solomon R. Guggenheim founded the museum in 1937 to promote modern art and education in art.

Bill Foley, Black Star

Cadets celebrate graduation from the United States Military Academy in West Point. The academy's four-year program prepares young men and women for careers as Army officers.

Colour Library International from the Photo Source

The New York Public Library in New York City has more volumes and more branches than any other city public library in the United States.

Visitor's guide

New York is one of the chief vacationlands in the United States. Its forested mountains, shimmering lakes, sandy beaches, and vast areas of unspoiled wilderness attract millions of summer vacationers yearly. Long Island's beaches and the Thousand Islands area are especially popular for fishing and water sports. Winter sports fans enjoy New York's excellent facilities for skiing, snowmobiling, tobogganing, iceboating, ice fishing, and ice-skating. Visitors also come to see New York's many historic forts and houses, and such magnificent wonders of nature as Niagara Falls. Every major urban center has places of historical and cultural interest. New York City's attractions draw millions of visitors a year. See **New York City.**

Many cultural festivals, historical celebrations, and sports competitions are held in New York every year. The New York State Fair is held annually in Syracuse in late August and early September. Buffalo, Niagara Falls, and Ogdensburg hold international festivals with the Canadian towns they border.

Thomas A. Moore, FPG

The Metropolitan Opera House at Lincoln Center in New York City

Places to visit

Following are brief descriptions of some of New York's many interesting places to visit.

Corning Glass Center, in Corning, features a factory that makes Steuben glass, a type of art glass. The center also includes a Museum of Glass, Hall of Science and Industry, and shops.

Farmers' Museum, near Cooperstown, has early agricultural tools and appliances. Nearby is the 19th Century Village. It includes a country school, law office, village store, blacksmith shop, print shop, doctor's office, church, tavern, and farmhouse and barn. All were built in the late 1700's or early 1800's.

Fort Niagara, near Youngstown, was the scene of fighting during the French and Indian War (1754-1763) and the War of 1812 (1812-1815).

Fort Ticonderoga, on Lake Champlain, is a reconstruction of the colonial fort where Ethan Allen and his Green Mountain Boys defied the British and forced them to surrender in 1775.

Home of Franklin D. Roosevelt National Historic Site, in Hyde Park, includes the president's grave and Val Kill, Eleanor Roosevelt's cottage. Nearby, the Franklin D. Roosevelt Library and Museum has many of Roosevelt's books, ship models, and other personal belongings.

Lake Placid, a village in the Adirondack Mountains, is a world-famous resort. It is noted for its glacial lake and its excellent facilities for winter and summer sports. The 1932 and 1980 Winter Olympics took place there.

Literary shrines may be seen throughout New York. They include John Burroughs's birthplace in Roxbury, Thomas Paine's home in New Rochelle, and Walt Whitman's birthplace near Huntington. Mark Twain's study and grave are in Elmira. The cottage in which Robert Louis Stevenson wrote several of his books is in Saranac Lake. The cottage in which Edgar Allan Poe wrote many poems is in the Bronx, in New York City.

National Baseball Hall of Fame and Museum, in Cooperstown, honors great baseball players and displays historic equipment of the game. A new theater seats 200 people.

Niagara Falls, in the city of Niagara Falls, is the most famous, most accessible waterfall in the world. Water plunges into a steep-walled gorge at the rate of about 100,000 cubic feet (2,832 cubic meters) a second.

Saratoga Springs is a health resort noted for its mineral springs. The Saratoga Performing Arts Center is the summer home of the New York City Ballet, the New York City Opera, and the Philadelphia Orchestra. Saratoga Springs also has har ness and thoroughbred race tracks. Museums include the Na tional Museum of Racing and the National Museum of Dance

West Point, on the Hudson River north of New York City, is the home of the United States Military Academy.

National parklands. New York's national parklands include many sites of historical importance and a number of areas preserved for their attractive recreational features. For example, Saratoga National Historical Park, near Stillwater, include the battlefield on which the Americans defeated a British arm in 1777 during the Revolutionary War. Castle Clinton National Monument, in New York City, originally a fort, was once a landing station for immigrants. Statue of Liberty National Monument stands in Upper New York Bay at the entrance to New York Harbor. Fire Island National Seashore features the beaches, dunes, marshes, and wildlife of Fire Island, a barrie island off Long Island.

State parks and forests. New York has about 150 state parks and about 60 forest areas. Adirondack Park, covering 6 millio acres (2.4 million hectares) in the Adirondacks, is the largest park in the nation. The state owns about 40 percent of the park. Watkins Glen State Park, with 18 waterfalls, is one of the scenic wonders of North America. Letchworth State Park, on the Genesee River, is famous for its scenic canyon, the Genesee Gorge. For information, write to the Office of Parks, Recr ation, and Historic Preservation, Albany, NY 12238.

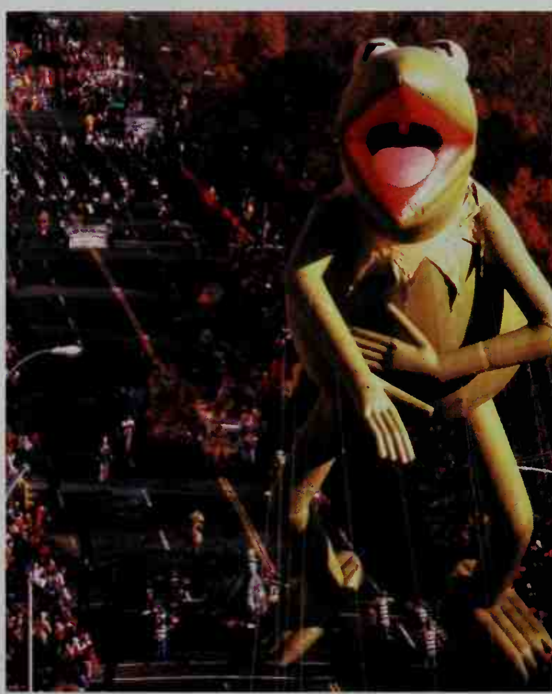
Anthony Morganti, FPG

World-famous Niagara Falls

Annual events

January-March
Bobsled and luge competitions in Lake Placid (every weekend, January through mid-March); Ski jumping competitions in Lake Placid (early January and mid-March); Winterfest in Syracuse (mid-February); Westminster Kennel Club Dog Show in New York City (February); Winter Carnival in Saranac Lake (February); St. Patrick's Day Parade in New York City (March).

April-June
Schoharie County Maple Festival in Jefferson (May); Hudson River White Water Derby in North Creek (May); National Lake Trout Derby on Seneca Lake near Geneva (May); Festival of Lilacs in Rochester (May); Empire State Regatta in Albany (June); A Festival of Gold in the Niagara region (mid-April-mid-May); Dressage at Saratoga in Saratoga (Memorial Day Weekend); Belmont Stakes Horse Race on Long Island (early June).



July-September
Jazz Festival New York in New York City, Saratoga Springs, and Canandaigua (July); Annual Summer Ski Jump in Lake Placid (July); German Alps Festival in Hunter, near Tannersville (July); Friendship Festival in Buffalo (July); Mormon Religious Pageant at Hill Cumorah near Palmyra (mid-July); National Baseball Hall of Fame Induction Ceremony in Cooperstown (late July or early August); The Great New York State Fair in Syracuse (August); Central New York Scottish Games in Liverpool (August); United States Tennis Association Championships in Flushing Meadow, Long Island (late August and early September); Pulaski Salmon Festival (September); Adirondack Hot Air Balloon Festival in Glens Falls (September).

October-December
Oyster Festival in Oyster Bay, Long Island (October); Thanksgiving Day Parade in New York City (November); Snowbird Soaring Regatta at Elmira (late November); Festival of Lights in Niagara Falls (Thanksgiving to early January); Rockefeller Center Tree Lighting Ceremony in New York City (December).

Thanksgiving Day Parade in New York City

Land and climate

Land regions. In the Pleistocene Epoch, which ended about 11,500 years ago, a sheet of ice up to 2 miles (3.2 kilometers) thick in places spread across almost all the area in what is now New York. It formed many of the state's most striking natural features by deepening valleys, rounding off mountains, and depositing sand, stones, and pebbles. Most of New York's soils have been formed from materials deposited by the ice.

New York has eight land regions: (1) the Atlantic Coastal Plain, (2) the New England Upland, (3) the Hudson-Mohawk Lowland, (4) the Adirondack Upland, (5) the Tug Hill Plateau, (6) the St. Lawrence Lowland, (7) the Erie-Ontario Lowland, and (8) the Appalachian Plateau.

The Atlantic Coastal Plain covers Long Island and Staten Island. It forms part of the almost level coastal plain stretching along the Atlantic Ocean from Massachusetts to the southern tip of Florida. Staten Island and the western end of Long Island lie within New York City. Both islands are important residential districts.

Fishing is an important source of income on the Atlantic Coastal Plain. In addition, farmers raise vegetables, fruits, flowers, and poultry there. Long, offshore barrier islands and broad, sandy beaches contribute to Long Island's popularity as a summer resort area.

The New England Upland, a region of hills and low mountains, extends along the lower half of New York's eastern border. It includes the Taconic Mountains and the southern part of the Hudson River Valley. Also in the region is Manhattan Island, the heart of New York City. In the Hudson Highlands near West Point, the Hudson River has cut a gorge 1,000-feet (300-meters) deep.

The Hudson-Mohawk Lowland covers most of the Hudson River Valley and the Mohawk River Valley. The lowland is about 10 to 30 miles (16 to 48 kilometers) wide and provides the nation's only natural navigable passage through the Appalachian Mountains. Since pioneer days, the Hudson and Mohawk river valleys have served as the most important transportation routes between the Atlantic Ocean and the Great Lakes. The fertile plains support fruit and dairy farms.

The Adirondack Upland is a roughly circular hill and mountain region about 100 miles (160 kilometers) in diameter in northeastern New York. The Adirondack Mountains are formed from hard, ancient rocks, perhaps the oldest in North America. More than 40 peaks rise over 4,000 feet (1,200 meters), with Mount Marcy, at 5,344 feet (1,629 meters), the highest point in the state. The region is a famous recreation area with hundreds of scenic lakes, streams, waterfalls, and peaks. Its thin soils are poor for farming, and the frost-free growing season is short. There is some lumbering and some lead, garnet, titanium, and zinc mining in the region.

The Tug Hill Plateau, an isolated part of the Appalachian Plateau, is a relatively flat rocky area. It is separated from the Adirondack Upland by the Black River Valley. The plateau stands in the path of cold winter air masses that cross unfrozen Lake Ontario and pick up heat and moisture.

As a result, the plateau receives more snow—over 225 inches (572 centimeters) a year—than anyplace in the nation east of the Rocky Mountains. The harsh climate and thin soils restrict farming and settlement.

The St. Lawrence Lowland lies along the south bank of the St. Lawrence River and north of the Adirondack Upland. The region averages 18 miles (29 kilometers) in width. The land is level to rolling, with soils of widely varying fertility. The region has many dairy farms. Fruit orchards are common near Lake Champlain. Summer homes line the banks of the St. Lawrence River, particularly near the river's beautiful Thousand Islands.

The Erie-Ontario Lowland is a low plain south and east of Lake Erie and Lake Ontario. The plain is 5 miles (8 kilometers) wide along Lake Erie and broadens to 35 miles (56 kilometers) wide north of Syracuse. It has many swamps. Oval-shaped hills called *drumlins* rise from 50 to 200 feet (15 to 60 meters). They were formed from pebbles and other deposits of the ice sheet. A limestone and dolomite ridge stretching east-west between Lake Erie and Lake Ontario forms the ledge over which the Niagara River drops in its famous waterfall.

Fruit farming is a speciality in the lowland's unusually fertile soils. The region also has prosperous vegetable farms, greenhouses, plant nurseries, and dairy farms. The ease of reaching the Mohawk-Hudson transportation route to the east and an abundant supply of water power from falls on the Niagara and Genesee rivers spurred development in the region. These factors led to the growth of industrial, shipping, and service centers such as Buffalo, Rochester, and Syracuse.

The Appalachian Plateau, also known as the *Allegheny Plateau,* covers half of the state and is New York's largest land region. In the western and central portions of the plateau, broad uplands 800 to 2,000 feet (240 to 610 meters) above sea level are separated by ice-deepened valleys. At the Finger Lakes, the deepest valleys are now occupied by long, deep lakes.

In the south and east, the plateau rises. The Catskill Mountains, at 2,000 to 4,000 feet (610 to 1,200 meters) high, are a year-round recreation area. Reservoirs in the Catskills help supply New York City with water.

The rugged Appalachian Plateau supports only smaller cities, villages, and population centers except for Binghamton. Most Appalachian Plateau farms specialize in dairying. The most fertile and level lands lie to the north between the Finger Lakes, and along river valleys emptying out of the Catskills. Vineyards, nurseries, and vegetable farms can be found there.

Coastline and shoreline. New York's coastline stretches 127 miles (204 kilometers) along the Atlantic Ocean. This figure does not include the coastline along Long Island Sound. Including the shoreline of every bay and inlet on Long Island, the state's coastline is almost 1,850 miles (2,977 kilometers) long. New York City has one of the world's great natural harbors. The harbor is deep and almost completely protected by land. Excluding bays and inlets, the state has 275 miles (443 kilometers) of shoreline along Lakes Erie and Ontario, 192 miles (309 kilometers) along the Niagara and St. Lawrence rivers, and 212 miles (341 kilometers) along islands and Long Island Sound. Buffalo is New York's chief Great Lakes port. Oceangoing ships reach it through the St. Lawrence Seaway.

Mountains. The Adirondacks in northern New York are the state's highest range. Two peaks rise over 5,000 feet (1,500 meters). They are 5,344-foot (1,629-meter) Mount Marcy, and 5,112-foot (1,558-meter) Algonquin Peak (also known as Mount MacIntyre). At 4,204 feet (1,281 meters), Slide Mountain is the tallest peak in the Catskills. South of the Catskills, and extending into New Jersey, a 1,000- to 2,000-foot (300- to 600-meter) ridge known as the Shawangunk Mountains is famed among rock climbers. The Helderberg Escarpment presents a steep 1,000-foot (300-meter) cliff facing Albany to the northeast. The Taconic Mountains, which rise to 2,000 feet (610 meters) east of the Hudson, are a western extension of the Berkshire Mountains in Massachusetts.

Rivers. New York's most important rivers, the Hudson and the Mohawk, form one of the nation's great trade routes. The Hudson originates from a lake called Tear-of-the-Clouds high on Mount Marcy. It tumbles south through narrow gorges with many rapids and waterfalls. Oceangoing ships can sail from New York City 150 miles (241 kilometers) up the Hudson as far north as Albany. At Cohoes, about midway on the Hudson's 306-mile (492-kilometer) trip to the sea, the Mohawk enters.

The Mohawk River, the chief branch of the Hudson River, connects the Hudson with the Erie-Ontario Lowland. The Mohawk rises in Oneida County and flows southeastward for about 145 miles (233 kilometers). It drains central New York. The Mohawk was important in the development of the interior because the river and its tributaries provided water for the eastern half of the Erie Canal.

The Genesee River starts in Pennsylvania, flows north through western New York, and empties into Lake Ontario north of Rochester. At Letchworth State Park, it passes through a spectacular gorge 600 feet (180 meters) deep nicknamed "The Grand Canyon of the East." The Oswego River and its branch, the Seneca, also empty into Lake Ontario. The Delaware, an important sports fishing and canoeing river, tumbles out of the Catskills to form the eastern boundary between New York and Pennsylvania. The Susquehanna River originates from Otsego Lake and flows southwest past Binghamton before entering Pennsylvania.

Other rivers include the short but powerful Niagara, flowing 34 miles (55 kilometers) from Lake Erie to Lake Ontario, and the St. Lawrence. Both carry huge quantities of water and form part of the international boundary with Canada. The East River is actually a strait that connects Long Island Sound with New York Bay and separates Manhattan Island from Long Island.

Waterfalls. The state's most famous waterfall, Niagara Falls, is also New York's most important source of hydroelectric power. The American Falls, at 176 feet (54 meters), lie in New York. The St. Lawrence rapids near Massena have also been developed as a major source of power. The thin, delicate Taughannock Falls is the highest waterfall in the northeastern part of the nation. It drops 215 feet (66 meters) into a spectacular glen before entering Lake Cayuga in the Finger Lakes region.

Lakes. Most of New York's several thousand lakes lie in the Adirondack region. About 2,000 lakes and ponds are nestled among the hills and mountains there. Many of the larger Adirondack lakes support year-round resorts. Lake George, on the eastern edge of the Adiron-

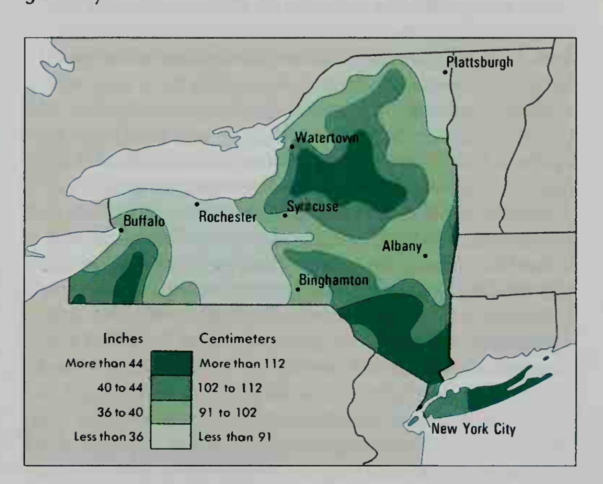
dacks, is a popular vacation spot. It empties into Lake Champlain. Lake Champlain lies on the New York-Vermont border and extends into the Canadian province of Quebec.

New York's largest lakes, by far, are Lake Erie and Lake Ontario. They form part of the boundary between the United States and Canada.

The long and narrow Finger Lakes lie parallel to one another in the Appalachian Plateau. Lakes Cayuga and Seneca are the largest and deepest of the 11 Finger Lakes. Lake Oneida, northeast of Syracuse, has the largest surface area lying entirely within the state. Covering 80 square miles (210 square kilometers), the lake is noted for its excellent boating and fishing. Chautauqua Lake in southwestern New York is a favorite summer resort. A famous arts and education center, the Chautauqua Institute, lies on its bank.

Plant and animal life. New York has many kinds of trees and plants. Forests cover about half the state, with the greatest ones in the Adirondacks. Smaller forests thrive throughout the Appalachian regions, where large areas of abandoned farmland have once again become woodland. About 150 types of trees, of which about 135 are native, grow in New York. Trees of commercial importance include balsam fir, beech, black cherry, oak, pine, spruce, sugar maple, and yellow birch. Apple orchards are common in the Lake Ontario Lowland, along Lake Champlain, and in the Hudson River Valley.

Many wild flowers bloom along river valleys throughout New York. They include black-eyed Susans, devil's paintbrush, and Queen Anne's lace. Buttercups, goldenrod, violets, and wild roses grow along the borders of forests and in clearings. White and yellow water lilies thrive in many Adirondack lakes. Other wild flowers common in New York include bunchberry, enchanter's nightshade, goldenthread, Indian pipe, starflower, and trillium.



Some animals that once were common in New York are now endangered or extinct. These include such fur-bearing animals as marten, mink, and otters, and such

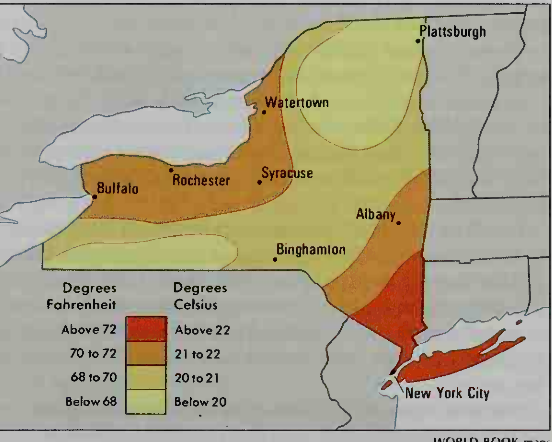
Average yearly precipitation

Precipitation in the state varies considerably. The wettest areas generally are in the mountains and in the southeast.



Average January temperatures

The northeastern part of New York has the lowest temperatures. The west and southeast have the mildest winters.

Average July temperatures

The state has fairly even summertime temperatures. The southeast and northwest are generally the warmest sections.

WORLD BOOK maps

Don Mason, West Stock

Lake Placid, a beautiful glacial lake, lies in the Adirondack Mountains of northeastern New York. The village of Lake Placid is a popular summer and winter resort.

important predators as the mountain lion, timber wolf, and wolverine. However, other native animals have adapted to human settlement. Porcupines, rabbits, red fox, squirrels, and woodchucks abound in some areas. Many deer roam the forests. The state's fur-bearing animals include beavers, muskrats, opossums, raccoons, and skunks. Eastern black bears and wildcats are found in remote mountain areas.

Game birds include Canada geese, grouse, partridges, pheasants, quail, wild ducks, and wild turkeys. Falcons, hawks, and owls can also be found. Bald and golden eagles are seen in New York occasionally.

Freshwater fish common in New York include bass, perch, pike, salmon, sunfish, and trout. Bluefish, clams, flounder, oysters, shad, swordfish, and many other fish and shellfish live in bays and ocean waters.

Climate. New York's climate varies greatly. The average January temperature ranges from 14 °F (−10 °C) in the central Adirondacks to 30 °F (−1 °C) on Long Island. The average July temperature in the central Adirondacks is 66 °F (19 °C), and 74 °F (23 °C) on Long Island. New York's record high temperature, 108 °F (42 °C), was recorded at Troy in east-central New York on July 22, 1926. Old Forge, in the Fulton Chain Lakes area, recorded a record low of −52 °F (−47 °C) on Feb. 18, 1979.

The frost-free growing season in New York ranges from an average high of 200 days on Long Island to less than 100 days in the central Adirondacks. New York's average annual *precipitation* (rain, melted snow, and other forms of moisture) ranges from 32 to 58 inches (81 to 147 centimeters). The most precipitation occurs on Tug Hill, the southwestern slopes of the Adirondacks, the central Catskills, and Long Island. In central, northern, and western New York, the Great Lakes, with their broad expanse of open water, supply moisture for many cloudy days and abundant winter snowfall. Syracuse, Rochester, and Buffalo routinely receive a greater annual snowfall than any other large city in the nation.

Economy

New York has a varied economy. Its excellent location, large population, and outstanding transportation facilities have helped make it a leader in business and industry. New York ranks near the top among all states in many important economic sectors, including accounting, banking, corporation management, manufacturing, public relations, publishing, and trade.

Service industries, taken together, account for the largest portion of New York's *gross state product*—the total value of goods and services produced in the state annually. Only California has a higher gross state product than New York. Finance, insurance, and real estate form the single most important economic activity in New York.

Much of the state's economic production takes place in New York City. The city is one of the world's leading economic centers. But other parts of the state also contribute to the economy. For example, northern New York is one of the nation's leading dairy-farming regions, and Rochester is among the most important U.S. manufacturing areas.

Natural resources in New York include fertile soils, a variety of minerals, and abundant supplies of water.

Production and workers by economic activities

Economic activities	Percent of GSP* produced	Employed workers: Number of people	Employed workers: Percent of total
Finance, insurance, & real estate	32	1,102,700	11

The New York Stock Exchange ranks as the nation's largest stock exchange. The business, financial, and trading organizations in New York City play a major role in the economy of the United States and of the world.

Alex Quesada, Matrix

Soils. The ice sheet that once covered what is now New York left behind a variety of soils. The Atlantic Coastal Plain has fertile sandy and *alluvial* (water-deposited) soils. The Erie-Ontario Lowland, the Hudson-Mohawk Lowland, the St. Lawrence Lowland, and river valleys throughout the Appalachian Plateau have fertile, well-drained soils. The soils of the rest of the Appalachian Plateau and the New England Upland tend to be poor, gray-brown, silty soils. These soils developed from glacial *drift.* Drift is material ranging in size from great boulders to fine rock dust laid down by the melting ice sheet. The Catskills, the Adirondack Upland, and Tug Hill Plateau have rough, stony soils.

Minerals. The Adirondacks and St. Lawrence Lowland are important suppliers of lead, talc, and zinc. The Adirondacks also supply a major part of the country's industrial garnets, used for watch jewels and in the manufacture of such abrasives as sandpaper. Petroleum and natural gas lie in western New York.

Clay, which is used in brick and cement manufacturing, is found in the Hudson Valley and in Erie and Onondaga counties. Deposits of sand, gravel, and stone, all of which are used in construction, are found throughout the state. Granite, limestone, and sandstone are especially valuable. Major salt and gypsum deposits are found in central and western parts of New York.

Water. New York has plentiful supplies of water for use by homes, factories, and farms. Falls and rapids on the Niagara and St. Lawrence rivers are among the largest sources of hydroelectric power in North America. In addition, New York's rivers are also used for recreation and transportation.

Service industries account for the largest part of New York's gross state product. Most of the service industries are concentrated in the state's metropolitan areas, but especially in the New York City area.

Finance, insurance, and real estate form New York's most important service industry in terms of the gross state product. New York City is the nation's leading financial center. The city is the home of most of the largest U.S. banks, including Chase Manhattan. Other large financial companies headquartered in the city include American Express, Citigroup, Merrill Lynch, and Morgan Stanley Dean Witter. The New York Stock Exchange is the nation's largest securities exchange. Many major insurance companies are based in New York City. The real estate business is also a major economic activity in New York City. A high demand for prime office space in Manhattan has resulted in some of the world's highest property values. Other important financial centers in the state include Albany, Buffalo, and Rochester.

Community, business, and personal services rank second among New York's service industries. This industry employs more of the state's workers than any other economic activity. Community, business, and personal services include activities such as private health care, accounting firms, management consulting firms, law firms, advertising agencies, entertainment companies, and personnel agencies. Private health care, the largest part of the industry, is important throughout the state. Several of the world's largest law firms and advertising agencies are based in Manhattan. Movies, plays, and sporting events are among the leading forms of entertainment in New York.

Wholesale and retail trade is the third-ranking service industry in New York. The wholesale trade of clothing, grain, groceries, jewelry, and petroleum is important in the state. Many wholesale companies are based in New York City. The city's port handles much foreign trade. A large number of wholesale companies are also based in Albany and Buffalo and on Long Island. Major types of retail firms in the state include car dealerships, food stores, and restaurants. Leading retail companies based in New York include R. H. Macy and Melville.

Government ranks fourth among the state's service industries. Government services include the operation of public schools and hospitals, and military establishments. Many of New York's people are employed by local school districts and by the state higher education system. State government offices are based in Albany. New York City has many federal, state, and local government workers.

Transportation, communication, and utilities rank fifth among service industries in New York. The state's

largest utility companies are Consolidated Edison and Niagara Mohawk Power Corporation. Two of the largest U.S. communication companies, AT&T Corp. and Verizon Communications, are headquartered in New York City. More information about transportation and communication appears later in this section.

Manufacturing. Goods produced in New York have a *value added by manufacture* of about $80 billion yearly. Value added by manufacture is the increase in value of raw materials after they become finished products.

New York ranks among the leading manufacturing states. The state has about 24,000 industrial plants. These plants employ nearly 800,000 workers. New York's factories make a wide variety of products—from huge machines to tiny computer chips.

Chemicals rank first among New York's manufactured products. Pharmaceuticals and chemicals used in the making of photographic film and paper are the state's leading chemical products. Bristol-Myers Squibb, a top maker of pharmaceuticals, is headquartered in New York City. Eastman Kodak, a leading maker of photographic chemicals and many other products, is based in Rochester. Other important chemical products made in the state include soaps, industrial chemicals, paints, plastics, and agricultural chemicals.

Machinery is the state's second-ranking manufactured product in terms of value added. The industry's leading products include industrial equipment, photographic and photocopying equipment, and refrigeration equipment. The major centers of machinery production in the state include Buffalo, New York City, Poughkeepsie, Rochester, and Syracuse.

Computer and electronic products rank third among New York's manufactures. Leading products in this category include computer components and microchips, communications equipment, and surveillance and navigation equipment. The chief centers of the electronic products industry are Binghamton, Buffalo, New York City, Rochester, the Nassau-Suffolk metropolitan area, Schenectady, and Utica. International Business Machines (IBM), a major computer manufacturer, has its headquarters just north of New York City.

Food products rank fourth among the state's manufactured goods. The state's important food products include dairy products, canned fruits and vegetables, flour, baked goods, beer, and soft drinks. The state's major centers of food production include the Buffalo-Niagara Falls area, Nassau and Suffolk counties on Long Island, New York City, and Rochester.

Transportation equipment is New York's fifth-ranking manufactured product. Motor vehicle parts and aerospace equipment are the most valuable transportation products made in the state.

Other manufacturing industries produce clothing, fabricated metal products, printed materials, and many other items. New York City ranks as the nation's chief center for the production of women's clothing and makes large amounts of men's clothing. Rome is a center for the manufacture of copper products. New York leads all other states by far in printing and publishing. New York City is the center of the publishing industry in the United States. The New York City area does about 10 percent of the nation's printing and publishing. Other important products manufactured in the state include paper products, plastics and rubber products, medical supplies, and jewelry.

Agriculture. Farmland covers about a fourth of New York's land area. The state has approximately 38,000 farms.

Livestock and livestock products provide about two-thirds of New York's agricultural income. Milk is the state's leading agricultural product. New York ranks among the leading states in milk production. The northern and central parts of the state are the leading areas for milk production.

Beef cattle are an important source of livestock income in New York. Dairy herds are also a significant source of beef. Milk cows that are no longer productive are often sold to slaughterhouses.

New York farmers also raise poultry and eggs, hogs, and sheep. Sullivan County in the Catskills and Suffolk County on Long Island lead in egg and poultry production. Egg farms provide much income in Sullivan County. Western New York is the leading area for raising hogs and sheep.

Crops provide about a third of New York's agricultural income. The state's leading field crops are hay and corn, which are used primarily as feed for the state's dairy cattle. The Erie-Ontario Lowland in western New York is the leading region for hay and corn production.

New York is a leading center of fruit and vegetable production in the eastern United States. Orange and Suffolk counties, both of which lie near New York City, have many small vegetable farms, also called *truck farms.* Western New York also produces large amounts of vegetables. The most important vegetables grown in the state include cabbages, cucumbers, green peas, onions, snap beans, sweet corn, and tomatoes.

Apples are the leading fruit crop in New York, and grapes rank second. New York ranks among the leading states in the production of apples. The state's largest apple orchards lie near Lake Ontario and the Hudson River. Chautauqua County in far west New York leads in grape production. Cherries and peaches are also important fruit crops grown in the state.

Greenhouse and nursery products are an important source of agricultural income in New York. Flowers are the most important type of greenhouse and nursery product in the state. Suffolk County on Long Island accounts for about half of the income from greenhouse and nursery products. Other New York farm products include maple syrup, oats, potatoes, and wheat.

Mining. New York's leading mined products include stone, salt, and sand and gravel. Limestone is the most important type of stone quarried in the state. Most of the stone is crushed and used for road construction. Some is used to make portland cement, a mixture of burned limestone and clay. Most salt-mining operations are in the Appalachian Plateau region of western New York. Sand and gravel are mined throughout the state. New York is the only state that produces wollastonite, and it ranks among the leading states in the production of garnet and zinc. The state also produces clays, lead, natural gas, peat, silver, and talc.

Fishing industry. New York has an annual fish catch valued at about $78 million. Commercial fishing takes place in Long Island waters and in Lake Erie and Lake Ontario. Clams, flounder, lobsters, oysters, scallops,

scup, striped bass, and whiting are taken from Long Island Sound. Bullheads, eels, walleye, and yellow perch are caught in Lake Erie and Lake Ontario.

Electric power. Nuclear plants and hydroelectric plants each supply about 25 percent of New York's electric power. Coal-burning plants and plants that burn natural gas each supply about 20 percent. Petroleum-burning plants supply most of the rest. New York's two largest hydroelectric power projects are the St. Lawrence Power Project and the Niagara Power Project. They were developed jointly with Canada. New York imports power from Canada and exports power to Pennsylvania, New Jersey, and the New England States.

Transportation. New York lies in the heart of the most thickly populated part of the United States. It is the chief gateway to the United States from other countries. It has one of the finest natural harbors in the world and an excellent system of inland waterways. All these factors have helped New York become one of the nation's leaders in transportation.

Railroads. About 40 railroads provide freight service, and Amtrak passenger trains serve about 25 New York cities. The state's first railroad, the Mohawk and Hudson, began running between Albany and Schenectady in 1831. New York City's subway, the busiest in the nation, covers approximately 235 miles (380 kilometers). More than 4 million riders jam these trains every working day.

Aviation. John F. Kennedy International Airport and La Guardia Airport are both in the Queens borough of New York City. Kennedy Airport handles more international flights than any other airport in the United States. La Guardia Airport handles mostly domestic flights. People traveling to and from New York City also use the airport in nearby Newark, New Jersey. Albany, Buffalo, Rochester, and Syracuse also have busy airports.

Roads and highways. New York has about 112,000 miles (180,000 kilometers) of roads and highways. The Governor Thomas E. Dewey Thruway is the world's longest toll superhighway. This 640-mile (1,030-kilometer) expressway runs across the state between New York City and the border with Pennsylvania at the western end of the state. It links Albany, Utica, Syracuse, Rochester, and Buffalo. Interstate 88 links Binghamton and Albany. Interstate 81 runs between the New York-Pennsylvania border south of Binghamton and the Canadian border, and Interstate 87 links Albany with the Canadian border.

New York has many great bridges. The George Washington, Tappan Zee, Bear Mountain, Mid-Hudson, Newburgh-Beacon, and Rip Van Winkle bridges span the Hudson River. The Brooklyn and Triborough bridges cross the East River. The Peace Bridge links Buffalo with Fort Erie in Canada. The Verrazano-Narrows Bridge across the Narrows Channel connects Brooklyn and Staten Island. Its 4,260-foot (1,298-meter) center span is the nation's longest. The Thousand Islands International Bridge connects the state with Canada.

Waterways. New York has one of the nation's largest internal waterway systems—the New York State Canal System. The system was completed in 1918, and includes parts of the old Erie Canal and several other waterways. The Erie Canal, which was opened in 1825, connected the Hudson River with Lake Erie. It played an important part in the economic growth of New York and the entire United States. The New York State Canal System and its connecting waterways cover about 800 miles (1,300 kilometers). They extend from Lake Champlain and the Hudson River to Lake Erie and Lake Ontario. The St. Lawrence Seaway, which was opened in 1959, turned New York's Great Lakes ports into seaports.

Shipping. New York City's port, officially called the Port of New York and New Jersey, is one of the world's

busiest seaports. Huge ocean liners and freighters from all parts of the world dock at this great port. Other major New York ports include Albany, Buffalo, Hempstead Harbor, and Port Jefferson, with more limited shipping from Chester and Tarrytown. Albany is a major shipping center, though it lies about 150 miles (240 kilometers) from the Atlantic Ocean. The Hudson River has been deepened so that ocean ships can reach Albany.

Communication. New York leads the nation in producing books, magazines, and newspapers. William Bradford established New York's first newspaper, the *New-York Gazette,* in New York City in 1725. Today, New York has about 830 newspapers, about 75 of which are dailies. One of the world's most influential newspapers, *The New York Times,* is published in New York City. Other well-known New York City newspapers are the *New York Post,* which is one of the nation's oldest papers, and the *Daily News. The Wall Street Journal,* the nation's leading business and financial newspaper, is also published in New York City. The Associated Press also has its headquarters there. New York publishers produce about 2,300 periodicals. *Newsweek, Reader's Digest, Sports Illustrated, Time, TV Guide,* and many other magazines all have headquarters in New York City.

The General Electric Company set up New York's first radio station, WGY, in its Schenectady laboratories in 1922. The National Broadcasting Company (NBC) established the first coast-to-coast radio network in 1926 in New York City. About 390 radio stations serve the state.

WNBT, the nation's first commercial television station, began operating in New York City in 1941. New York City is the corporate headquarters of ABC Inc., CBS Inc., and NBC. The Fox Broadcasting Company originates many of its programs from New York City. The state has about 50 television stations. Cable TV systems and Internet providers serve many communities.

Government

Constitution. New York adopted its first constitution in 1777. The present Constitution was adopted in 1894, and has been *amended* (changed) more than 180 times. An amendment may be proposed in the State Legislature. In order to pass, the proposal must be approved by a majority in both legislative houses of two successive, separately elected legislatures. The proposed amendment must then be approved by a majority of the persons who vote on the proposal.

The Constitution may also be amended by a constitutional convention. A proposal to call a convention must be approved by a majority of the Legislature and by a majority of the voters. Constitutional amendments that are suggested by the convention become law after they have been approved by a majority of the citizens voting on them.

Executive. The governor of New York is elected to a four-year term and may serve an unlimited number of terms. The lieutenant governor, attorney general, and comptroller are also elected to four-year terms. The secretary of state is appointed by the governor with the approval of the state Senate. The governor heads the executive department, one of the 20 departments that administer the state government. The governor, with the approval of the Senate, appoints most other department heads.

Legislature of New York consists of a Senate of 61 members and an Assembly of 150 members. Voters in senatorial and Assembly districts elect the members of both houses of the Legislature to two-year terms. The Legislature meets every year on the first Wednesday after the first Monday in January. Special sessions can be called by the governor or by petition of two-thirds of the Legislature. Regular and special sessions have no time limit.

Courts. New York is divided into 12 judicial districts. The voters in each district elect a varying number of Supreme Court judges to 14-year terms. Altogether, New York has about 314 Supreme Court justices. They make up the state Supreme Court.

New York is also divided into four judicial departments. Each department has an appellate division of the Supreme Court. The appellate divisions hear appeals from the Supreme Court and from other trial courts within their jurisdictions. The governor selects the Supreme Court justices of the appellate divisions. Two appellate divisions have at least seven justices each. The other two appellate divisions have five each.

The highest court in New York is the Court of Appeals. It has a chief judge and six associate judges. Each of these judges is appointed to a 14-year term. This court hears cases only from the appellate divisions of the Supreme Court.

Each New York county, except those that make up New York City, has a county court. County courts hear civil and criminal cases. A surrogate court in each county deals with wills and estates. All counties have family courts that handle domestic matters. New York City has a civil court and a criminal court. In addition, there are

State Legislatur

The New York State Legislature consists of an Assembly of 150 members and a Senate of 61 members. The Assembly meets in chambers in the State Capitol in Albany, *shown here.*

The state governors of New York

	Party	Term		Party	Term
George Clinton	None	1777-1795	**Alonzo B. Cornell**	Republican	1880-1882
John Jay	Federalist	1795-1801	**Grover Cleveland**	Democratic	1883-1885
George Clinton	*Dem.-Rep.	1801-1804	**David Bennett Hill**	Democratic	1885-1891
Morgan Lewis	*Dem.-Rep.	1804-1807	**Roswell Pettibone Flower**	Democratic	1892-1894
Daniel D. Tompkins	*Dem.-Rep.	1807-1817	**Levi Parsons Morton**	Republican	1895-1896
John Tayler	*Dem.-Rep.	1817	**Frank Sweet Black**	Republican	1897-1898
De Witt Clinton	*Dem.-Rep.	1817-1822	**Theodore Roosevelt**	Republican	1899-1900
Joseph C. Yates	*Dem.-Rep.	1823-1824	**Benjamin B. Odell, Jr.**	Republican	1901-1904
De Witt Clinton	*Dem.-Rep.	1825-1828	**Frank Wayland Higgins**	Republican	1905-1906
Nathaniel Pitcher	Independent	1828	**Charles Evans Hughes**	Republican	1907-1910
Martin Van Buren	*Dem.-Rep.	1829	**Horace White**	Republican	1910
Enos T. Throop	Democratic	1829-1832	**John Alden Dix**	Democratic	1911-1912
William L. Marcy	Democratic	1833-1838	**William Sulzer**	Democratic	1913
William H. Seward	Whig	1839-1842	**Martin Henry Glynn**	Democratic	1913-1914
William C. Bouck	Democratic	1843-1844	**Charles S. Whitman**	Republican	1915-1918
Silas Wright	Democratic	1845-1846	**Alfred E. Smith**	Democratic	1919-1920
John Young	Whig	1847-1848	**Nathan L. Miller**	Republican	1921-1922
Hamilton Fish	Whig	1849-1850	**Alfred E. Smith**	Democratic	1923-1928
Washington Hunt	Whig	1851-1852	**Franklin D. Roosevelt**	Democratic	1929-1932
Horatio Seymour	Democratic	1853-1854	**Herbert H. Lehman**	Democratic	1933-1942
Myron Holley Clark	Whig	1855-1856	**Charles Poletti**	Democratic	1942
John Alsop King	Republican	1857-1858	**Thomas E. Dewey**	Republican	1943-1954
Edwin Denison Morgan	Republican	1859-1862	**W. Averell Harriman**	Democratic	1955-1958
Horatio Seymour	Democratic	1863-1864	**Nelson A. Rockefeller**	Republican	1959-1973
Reuben Eaton Fenton	Republican	1865-1868	**Malcolm Wilson**	Republican	1973-1974
John Thompson Hoffman	Democratic	1869-1872	**Hugh L. Carey**	Democratic	1975-1982

Samuel Jones Tilden	Democratic	1875-1876	**George E. Pataki**	Republican	1995-
Lucius Robinson	Democratic	1877-1879			

*Democratic-Republican

many town justices, city court judges, and village courts in the state.

Local government. New York has 62 counties, including the 5 that make up the boroughs of New York City. A board of supervisors or a county legislature governs each county except the New York City boroughs. The officials of these boards and legislatures are elected either from the towns and cities of the county, or from county legislative districts. The major responsibilities of most counties include the administration of courts, highways, and welfare. In addition to these responsibilities, counties deal with the administration of community colleges, libraries, garbage disposal, and parks and recreation.

Within New York's counties are villages, towns, and cities. An elected mayor and board of trustees governs each village. Each town is governed by an elected supervisor and town board.

Most New York cities have the mayor-council form of government. Some cities have the city manager form of government. The state legislature has the authority to draw up city charters. Cities, in turn, may adopt and amend local laws and revise their charters, thus determining their own form of government. But New York City, because of its large population and area, has a different government from that of the other cities (see New York City [Government]).

Revenue. Taxes account for about three-fifths of the state government's *general revenue* (income). Federal grants and other U.S. government programs make up most of the rest. A personal income tax provides the greatest portion of the tax revenue. Other tax revenue sources include a general sales tax and taxes on corporate income, public utilities, tobacco products, insurance, motor vehicle licenses, motor fuels, and alcoholic beverages. A state lottery and charges for government services, such as toll-road collections, also contribute to the state's general revenue.

Politics. Enrolled Democratic voters in New York City usually outnumber Republicans about 5 to 1. But in the rest of the state, there are slightly more enrolled Republicans than Democrats. Albany and Erie Counties are often the only upstate counties to vote Democratic. Therefore, the two parties are fairly evenly matched, because New York City has about 40 percent of the state's total population. Republicans have generally controlled the state senate, while Democrats have controlled the assembly.

New York has 33 electoral votes—more than any other state except California. For this reason, New York plays a key role in United States presidential elections and its governors have always been considered possible presidential candidates. New York governors often have introduced national issues into state politics. Four men served as governor of New York before becoming president—Martin Van Buren, Grover Cleveland, Theodore Roosevelt, and Franklin D. Roosevelt. Five other governors—Horatio Seymour, Samuel J. Tilden, Charles Evans Hughes, Alfred E. Smith, and Thomas E. Dewey—were unsuccessful nominees for the presidency of the United States.

Since 1880, New Yorkers have voted for the winning presidential candidate in every election except those that occurred in 1916, 1948, 1968, 1988, and 2000. For New York's electoral votes and voting record, see **Electoral College** (table).

Early days. Two of the largest and most powerful Indian groups in North America lived in the New York region before European settlers came. One Indian group consisted of the Delaware, Mahican, Montauk, Munsee, and Wappinger tribes. These tribes made up the Algonquian family of Indians. The other Indian group was the Iroquois, or Five Nations. The Cayuga, Mohawk, Oneida, Onondaga, and Seneca tribes made up the Five Nations of the Iroquois Confederacy (see **Iroquois Indians**). Both Indian groups farmed, hunted, and fished. The Iroquois were especially advanced in political and social organization.

Exploration and settlement. Giovanni da Verrazzano, an Italian navigator and explorer, was probably the first European to visit the New York region. Verrazzano supposedly was hired by King Francis I of France to explore the northern part of America. Historians believe Verrazzano may have sailed into New York Bay and reached the Hudson River about 1524.

In 1609, Henry Hudson, an Englishman employed by the Dutch, sailed up the river that now bears his name. He was looking for a Northwest Passage to the Orient. Hudson's voyage gave the Netherlands a claim to the territory covering much of present-day New York, New Jersey, Delaware, and part of Connecticut. The territory was later named *New Netherland.*

Also in 1609, the French explorer Samuel de Champlain entered the northern part of New York from Quebec. His visit gave France a claim to the land.

The Dutch established several trading posts and prosperous settlements in the Hudson River Valley soon after Hudson's visit. There, they built up a profitable fur trade with the Indians. In 1621, a group of Dutch merchants formed the Dutch West India Company. The government of the Netherlands gave the company all rights to trade in New Netherland for the next 24 years. In 1624, the company sent about 30 families to settle in the region. Some of these families founded Fort Orange (now Albany), the first permanent white settlement in the colony. The rest of them established settlements in other parts of New Netherland.

In 1625, a group of Dutch colonists began building a fort and laying out a town on Manhattan Island. They named their settlement *New Amsterdam.* In 1626, Peter Minuit, the Dutch governor (or director-general), bought Manhattan from the Indians for goods worth 60 Dutch guilders, or about $24. During the next few years, Wiltwyck (now Kingston), Rensselaerswyck (now Rensselaer), Breuckelen (now Brooklyn), Schenectady, and other settlements were established in New Netherland by Dutch colonists.

In 1629, the Dutch West India Company set up the *patroon* (landowner) system to speed the settlement of New Netherland. Members of the company were given huge tracts of land, which they could keep if they colonized the land with settlers. Only one patroonship lasted into the 1700's, that of Kiliaen Van Rensselaer, an Amsterdam diamond merchant. His land covered much of present-day Albany, Columbia, and Rensselaer counties. Van Rensselaer began the practice of leasing his land to tenant farmers. The tenant system in New York lasted until the 1840's. A series of tenant revolts forced it to end. See **Patroon system**.

Under English rule. Many English colonists from Connecticut and Massachusetts settled on Long Island. For a long time, they cooperated with the Dutch. But gradually the English began to oppose the Dutch. In addition, King Charles II of England decided to take over New Netherland. He gave his brother James, the Duke of York, a charter for the territory. In 1664, the English sent a fleet to seize New Netherland. The warships dropped anchor in the harbor of New Amsterdam. Peter Stuyvesant, the Dutch governor, surrendered the settlement without a fight.

Copy (1670) of a drawing (1660) by Jacques Cortelyou; Museum of the City of New York

New Amsterdam was founded by Dutch settlers on Manhattan Island in 1625. This picture shows the layout of the settlement in 1660. The English later captured the colony and renamed it New York.

Fighting near Saratoga in 1777 resulted in a major victory for the American Army during the Revolutionary War. The patriots drove back about 1,500 British troops in the Second Battle of Freeman's Farm, *left.*

Oil painting on canvas; Fort Ticonderoga Museum

The English renamed the territory *New York,* after the Duke of York, who later became King James II of Eng- and. Under the Treaty of Breda, signed in 1667, the Dutch formally gave up all New Netherland to England.

Soon after the English won control of southern New York, the French began to take great interest in the northern part. In 1669, the French explorer René-Robert Cavelier, Sieur de La Salle, entered the Niagara region. In 1731, the French built a fortress at Crown Point on Lake Champlain. They prepared to take permanent possession of northern New York. Meanwhile, in 1689, war had broken out in Europe between England and France. New York soon became a battleground in the struggle between the two countries.

From 1689 until 1763, the region suffered severely through four wars, known in America as the French and Indian wars. Battles were fought at Crown Point, Fort Niagara, Fort Ticonderoga, and many other places. The French received aid from the Algonquian Indians in the wars, but the Iroquois Indians provided assistance to the British.

The French and Indian wars delayed settlement of the frontier regions and slowed the growth of sections that had already been settled. Britain and France signed a peace treaty—the Treaty of Paris—in 1763. However, the wars cost France almost all its possessions in North America. See **French and Indian wars.**

In 1735, John Peter Zenger, publisher of the *New-York Weekly Journal,* won a great victory for freedom of the press. Zenger had criticized the British governor, and was charged with seditious libel—that is, with making statements aimed at stirring up discontent or rebellion against the government. In a historic trial, the jury found Zenger innocent.

The Revolutionary War. British policies angered many people of New York. They did not like the presence of British troops, the authority of royal judges, or the taxes passed by the British Parliament. Other New Yorkers, called Loyalists or Tories, did not oppose the British. Nobody knows how many New Yorkers were Loyalists. But during and after the Revolutionary War (1775-1783), perhaps as many as 30,000 people left the state.

During the Revolutionary War, New York was the scene of many battles. The British occupied New York City during the entire war. The Loyalists helped the British and persuaded the Iroquois Indians to fight the patriots. American patriots won the First and Second Battles of Freeman's Farm in New York in 1777. These victories led to a British surrender at Saratoga and marked a turning point in the war.

Statehood. On July 9, 1776, the provincial congress of New York met in White Plains. It approved the Declaration of Independence, which the Continental Congress had adopted on July 4. The congress also organized an independent government. The next year, New York adopted its first constitution. George Clinton was elected governor. Clinton later served as vice president under two U.S. presidents, Thomas Jefferson and James Madison.

On Feb. 6, 1778, New York approved the Articles of Confederation. It did not want a strong federal government. But it finally ratified the United States Constitution on July 26, 1788. New York was the 11th state to enter the Union. New York City served as the U.S. capital from 1785 to 1790. In 1789, George Washington was inaugurated as the nation's first president. The inauguration took place in Federal Hall in New York City.

Settlement of the interior progressed rapidly. In 1779, during the Revolutionary War, General Washington sent an expedition to crush the mighty Iroquois. Troops commanded by General James Clinton raided Indian villages up through the Mohawk Valley. The soldiers then moved down the Susquehanna River to Tioga, Pennsylvania. There, they joined troops commanded by General John Sullivan. The combined force of about 3,500 men marched through the Finger Lakes region to the Genesee Valley. The soldiers destroyed Indian villages, killed the Indians' livestock, and burned their fields. The heart of the Iroquois territory was left in ruin. The military

Erie Canal Celebration, New York 1825 (1825), an oil painting on canvas by Anthony Imbert; Museum of the City of New York

The Erie Canal opened in 1825 with a huge celebration. The canal provided an all-water route between the Hudson River and Buffalo. It greatly lowered the cost of transporting goods.

power of the Iroquois lay broken forever, leaving the area open to white settlement. After the Revolutionary War, soldiers who had fought in the area told of its level, fertile land. Many veterans settled on grants of land they received there. By 1810, New York had a population of 959,049, more people than any other state.

War broke out between the United States and Britain in 1812 (see **War of 1812**). Much of the fighting took place in frontier regions near the New York-Canada border. After the war, pioneers began to settle in the northern and western sections of the state. Many of these settlers came from other parts of New York, but many also came from Canada, New Jersey, Delaware, Pennsylvania, and especially New England. By 1820, about 500,000 people lived in frontier settlements, and the state had a population of over 1,370,000.

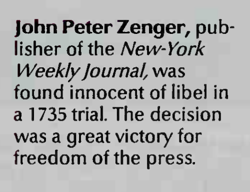
Growing prosperity. As the frontier was opened, the people of New York realized that better transportation would be needed between the coast and the interior. Governor De Witt Clinton had long urged the construction of a canal to link the Atlantic Ocean and the Great Lakes. In 1825, the famous Erie Canal was completed. It crossed New York from Buffalo on Lake Erie to Troy and Albany on the Hudson River. The canal provided an important link in an all-water route between New York City and Buffalo. It greatly lowered the cost of transporting goods. Farmers in the West shipped their produce to the East by way of the Great Lakes and the Erie Canal. Products from New York's growing factories were, in turn, shipped on the canal to western markets.

The development of railroads across the state soon followed the opening of the Erie Canal. The canal and railroads greatly encouraged the state's growing prosperity. They also provided jobs for many of the thousands of European immigrants who were pouring into the state. By 1850, New York was firmly established as the *Empire State.* It led the nation in population, in manufacturing, and in commerce.

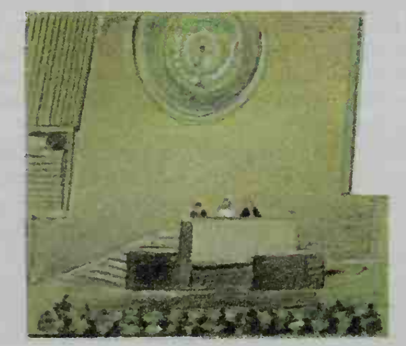
The Bay and Harbor of New York (1855), a water color on canvas by Samuel Waugh; Museum of the City of New York

European immigrants came to the United States in great numbers during the 1840's and 1850's. Many of those immigrants landed at New York Harbor, *shown here.*

Historic New York



Manhattan was purchased in 1626 by Peter Minuit, the director-general of New Netherland. He paid the Manhattan Indians about $24 in goods for the island.



George Washington took the oath of office as the nation's first president in New York City in 1789. New York City was the U.S. capital from 1785 to 1790.

John Peter Zenger, publisher of the *New-York Weekly Journal,* was found innocent of libel in a 1735 trial. The decision was a great victory for freedom of the press.

The United Nations selected New York City as its permanent home in 1946. UN headquarters were completed in 1952.

President William McKinley was assassinated at the Pan American Exposition in Buffalo in 1901.

WORLD BOOK illustrations by Kevin Chadwick

Important dates in New York

1609 Henry Hudson explored the Hudson River. Samuel de Champlain visited the New York region.

1624 The Dutch established Fort Orange (Albany), the first permanent white settlement in the New York region.

1625 Dutch settlers began building New Amsterdam (New York City).

1664 The Dutch surrendered New Amsterdam to England.

1735 Publisher John Peter Zenger was found innocent of libel, an important victory for freedom of the press.

1776 New York approved the Declaration of Independence.

1779 Military expeditions under Generals James Clinton and John Sullivan opened Iroquois land to white settlement.

1788 New York became the 11th state on July 26.

1789 George Washington was inaugurated in New York City as the first president of the United States.

1825 The Erie Canal was opened.

1831 New York's first railroad, the Mohawk and Hudson, began running between Albany and Schenectady.

1863 Mobs rioted in New York City in opposition to drafting men into the Union Army.

1901 President William McKinley was assassinated at the Pan American Exposition in Buffalo.

1939-1940 New York held a World's Fair.

1948 New York established its first state university—the State University of New York.

1952 United Nations Headquarters was completed in New York City.

1959 The St. Lawrence Seaway opening made "ocean" ports of New York's ports on Lake Erie and Lake Ontario.

1960 The New York State Thruway (now the Governor Thomas E. Dewey Thruway) was completed.

1964-1965 New York held another World's Fair.

1967 The state legislature established a lottery with profits going to education.

1986 The voters approved a bond act to finance environmental projects, especially the cleaning up of hazardous waste sites.

2001 The twin 110-story towers of the World Trade Center in New York City were destroyed in the worst terrorist attack in United States history.

Granger Collection

Civil War draft riots took place in New York City for four days in July 1863. Many people were opposed to the drafting of men into the Union Army. Mobs set fire to buildings and took over parts of the city. Troops called from the battlefield finally ended the riots, *shown here.*

Wealthy merchants and great landowners had controlled New York since colonial days. During the early 1800's, the state adopted more and more democratic practices. In the 1820's, white men no longer had to own property to be able to vote. A new constitution adopted in 1846 required that all major state officials be elected by the voters.

In 1839, the *antirent movement* began when tenant farmers refused to pay rent to wealthy landowners. The antirenters, disguised as Indians, ranged the Hudson and Mohawk river valleys and fought attempts by the landlords to evict them from their farms. The antirent movement grew rapidly and became a powerful political force in New York. During the 1840's, the great landlords began the process of breaking up their estates into small independent farms. See **Antirenters**.

Long before the Civil War began in 1861, many of New York's people strongly opposed slavery. But some did not. In July 1863, mobs rioted for four days in New York City. They objected to drafting men into the Union Army. The mobs burned, robbed, and murdered recklessly. They killed or wounded about 500 people and destroyed more than $ 1 $\frac{1}{2}$ million worth of property. Troops called from the battlefield finally ended the riots. Despite the draft riots, New York provided more soldiers, supplies, and money to the Union war effort than any other state.

After the Civil War ended in 1865, new manufacturing centers grew up in various parts of New York. More and more products of the Middle West flowed through Buffalo, the state's western gateway. Increased commerce between the United States and other countries passed through New York City, the state's eastern gateway. New York City, already the nation's industrial and financial capital, also became a leading cultural center. As manufacturing continued to increase, new waves of immigrants poured in, drawn by employment opportunities. They came from Italy, Poland, Russia, and other southern and eastern European countries. By 1900, the state had more than 7 million people.

The early 1900's. In 1901, a Pan American Exposition was held in Buffalo. The exhibition sought to promote unity and understanding between North and South America.

Theodore Roosevelt, a Republican, served as governor of New York in 1899 and 1900. He supported a number of reform bills, especially in the field of labor. In 1901, Roosevelt became vice president of the United States under President William McKinley. On Sept. 6, 1901, six months after the inauguration, an assassin shot McKinley while the president was attending the Pan American Exposition. McKinley died eight days later, and Roosevelt became president.

The United States entered World War I in 1917. New York City served as the great port from which thousands of American soldiers sailed for and returned from the battlefields of Europe.

The Great Depression of the late 1920's and the 1930's hit New York hard. Unemployment was severe. Men and women sold apples on street corners. Hungry people lined up at soup kitchens, or stood in bread lines that stretched for blocks.

Alfred E. Smith, a Democrat, served as governor of New York from 1919 to 1920 and from 1923 to 1928. He lost to Republican Herbert Hoover in the 1928 presidential election. Franklin D. Roosevelt was governor from 1929 to 1932. He served as president of the United States from 1933 until his death in 1945. Herbert H. Lehman succeeded Roosevelt as governor and served until 1942. Much of the social legislation supported by Governors Roosevelt and Lehman attacked the depression. This legislation later served as a model for federal laws urged by Roosevelt when he was president.

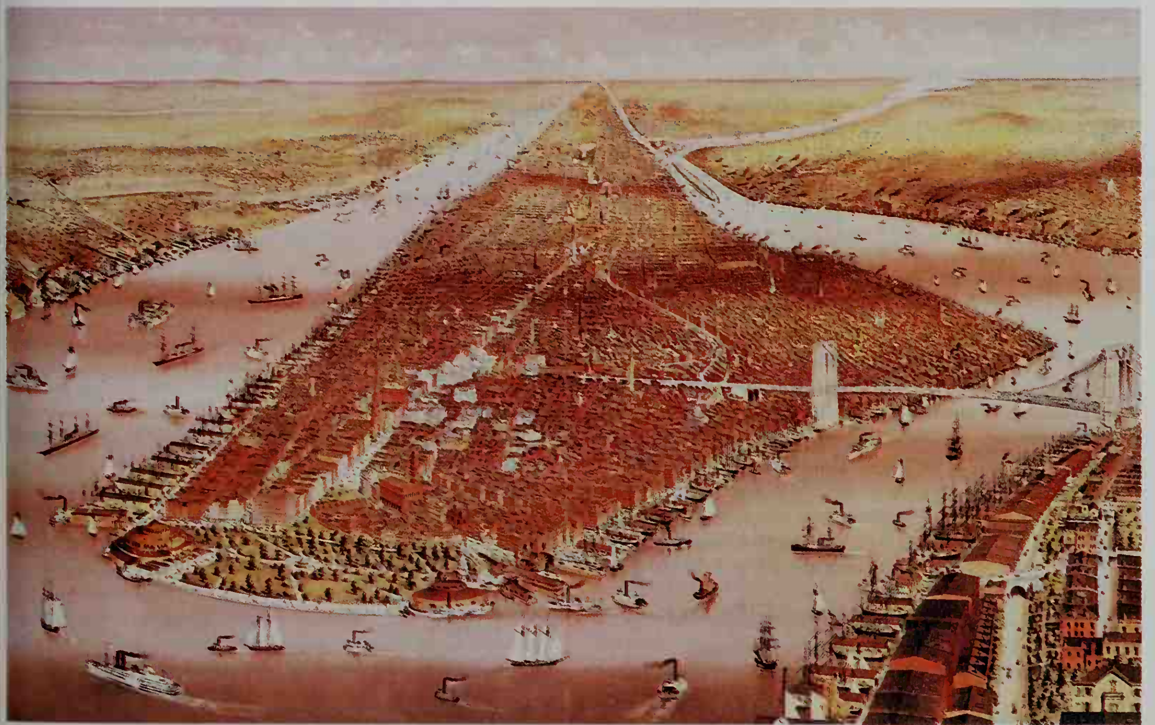
The mid-1900's. New York became a center of the

country's defense industry in the mid-1900's. Factories produced large amounts of war materials during World War II (1939-1945), the Korean War (1950-1953), and the Vietnam War (1957-1975). These materials came from the state's industrial centers—Buffalo, New York City, Rochester, Schenectady, and Syracuse—and hundreds of smaller communities. Growth occurred in several fields, including agriculture, banking, insurance, and manufacturing.

In 1946, the United Nations selected New York City as the site of its permanent home. Construction of UN headquarters was completed in 1952. Two world's fairs were held in New York City during the mid-1900's—in 1939 and 1940 and in 1964 and 1965.

In 1948, New York established the State University of New York (SUNY), its first state university. SUNY has grown into a system of more than 60 campuses.

During the late 1950's, New York and the Canadian province of Ontario developed large hydroelectric projects on the St. Lawrence and Niagara rivers. In 1961, the Niagara Power Plant opened. It is one of the largest hydroelectric facilities in the world.



New York also greatly improved its transportation system. The St. Lawrence Seaway opened in 1959, allowing oceangoing ships to sail to ports on the Great Lakes. In 1960, New York completed the world's longest toll superhighway, the New York State Thruway. This 559-mile (900-kilometer) expressway was renamed the Governor Thomas E. Dewey Thruway in 1964. Also in the 1960's, the federal government completed the New York portion of Interstate 81, stretching 180 miles (290 kilometers) from Pennsylvania to Canada. The 176-mile (283-kilometer) Adirondack Northway was also completed during this time. The scenic northway extends from Albany to Quebec. In 1964, the Verrazano-Narrows Bridge opened in New York City. It has one of the world's longest center spans.

During the 1960's, the Lincoln Center for the Performing Arts was built in New York City. The center serves as a home for some of the outstanding cultural institutions in the United States. These world-famous institutions include the Metropolitan Opera, the New York Philharmonic, the Juilliard School, the New York City Ballet, the New York City Opera, the Film Society of Lincoln Center, the Chamber Music Society of Lincoln Center, the Lincoln Center Theatre, and the School of American Ballet. In addition, two branches of the New York Public Library are located in the center.

The late 1900's. During the early 1970's, many manufacturing plants in New York closed, resulting in the loss of about 600,000 jobs. Many people moved away from the state as a result. However, this outflow of people leveled off during the 1980's, and the population showed an increase during the 1990's. The state's economy experienced a healthy recovery, due mainly to the tremendous growth in service industries and electronics manufacturing.

During the late 1900's, the state continued to maintain its great attractiveness for immigrants, especially Asians and Hispanics. New York ranks second only to California in the number of new immigrants it receives every year.

Like other states, New York began to deal with the

The City of New York (1884), a lithograph by Currier & Ives; Library of Congress

New York City served as the gateway for growing trade between the United States and other countries during the late 1800's. New York became the nation's financial and cultural center.

long-neglected problem of toxic industrial wastes. It is estimated that New York has over 500 hazardous waste sites that need cleaning. One of the most critical sites is the Love Canal neighborhood of Niagara Falls. In the 1970's and early 1980's, chemical wastes that had leaked from a former disposal site threatened the health of the area's residents. Both the New York state government and the federal government provided financial aid to help move the families from Love Canal to other areas. In 1986, New York voters approved a $1.45-billion bond act to finance environmental projects, chiefly the cleaning up of hazardous waste sites.

In addition to dealing with hazardous wastes, New York faced many other challenges in the late 1900's. These challenges, which continued into the 2000's, included improving social services and housing for the poor and mentally disabled and maintaining the state's extensive highway network. New York leaders also faced the need to provide better education for minority students, to curb drug abuse, and to improve the handling of the state's growing prison population.

The early 2000's. On Sept. 11, 2001, terrorists in hijacked commercial airplanes crashed the planes into the twin 110-story towers of the World Trade Center in New York City. Another hijacked plane crashed into the Pentagon Building, just outside Washington, D.C., and a fourth hijacked plane crashed in a field in Somerset County, Pennsylvania. The two Trade Center towers collapsed to the ground, and part of the Pentagon was destroyed. About 3,000 people were killed. The incidents were the worst terrorist attack in United States history.

Questions

Why have New York's governors often been considered possible presidential candidates?
What is New York's most magnificent natural wonder? In what part of the state is it located?
Why was the Erie Canal so important in New York's history?
Where did George Washington take the oath of office as the first president of the United States?
What are some of the reasons that New York is a leader in business and industry?
Who established New York's first newspaper?
What was the *antirent movement*?
Why has the Hudson-Mohawk Lowland been so important in the development of New York?
What is the role of the University of the State of New York? When was it established?
Why do Rochester, Syracuse, and Buffalo get so much snow?

New York, City University of, consists of 10 senior colleges, 7 community colleges, 1 technical college, a law school, a medical school, and a graduate school in New York City. The Mount Sinai School of Medicine is also affiliated with the university.

The 10 senior colleges of the City University of New York are Bernard M. Baruch College, City College, Hunter College, and John Jay College of Criminal Justice, all located in Manhattan; Herbert H. Lehman College in the Bronx; Brooklyn College and Medgar Evers College in Brooklyn; Queens College and York College in Queens; and College of Staten Island on Staten Island. These senior colleges offer liberal arts and science programs leading to bachelor's degrees. The university's technical college, the New York City Technical College, also offers bachelor's degrees.

Master's degrees are offered in business, education, engineering, fine arts, liberal arts, library science, nursing, public administration, social work, and urban planning. The university offers doctor's degrees in 35 fields.

The seven community colleges are Borough of Manhattan, Bronx, Hostos, Kingsborough, LaGuardia, Medgar Evers, and Queensborough. These colleges offer associate degrees in arts and sciences and applied science. In addition, Medgar Evers offers four-year degrees.

The City University of New York is supported by the city, state, and federal governments, and by fees, gifts, and tuition. It gained university status in 1961. The City University of New York is the largest urban system of higher education in the United States.

Critically reviewed by the City University of New York

New York, State University of, is the largest statewide public system of higher education in the United States. The university includes 4 university centers, 13 colleges of arts and science, and 3 health science centers. It also has 5 specialized colleges, 5 colleges of technology, 2 colleges of agriculture and technology, 5 statutory colleges, and 30 community colleges.

The four university centers are in Albany, Binghamton, Buffalo, and Stony Brook. Twelve of the 13 state colleges are in Brockport, Buffalo, Cortland, Fredonia, Geneseo, New Paltz, Old Westbury, Oneonta, Oswego, Plattsburgh, Potsdam, and Purchase. Empire State College is a nonresidential, nontraditional college with a coordinating center in Saratoga Springs. The three health science centers are in Brooklyn, Stony Brook, and Syracuse.

Other professional colleges in the State University of New York system include the College of Environmental Science and Forestry in Syracuse, the College of Optometry in New York City, the Institute of Technology at Utica/Rome, and the Maritime College in the Bronx, a borough of New York City. The statutory colleges are the New York State College of Ceramics at Alfred University and four colleges at Cornell University. The four colleges at Cornell are the New York State School of Industrial and Labor Relations and the New York State Colleges of Human Ecology, Veterinary Medicine, and Agriculture and Life Sciences.

The master's degree is offered at 28 campuses. The four university centers grant the Doctor of Philosophy degree. The Doctor of Medicine is offered at four campuses, and five campuses grant various other medical degrees.

Two-year programs leading to associate degrees are offered at the 30 community colleges. They are also offered at the colleges and institutes of technology at Alfred, Canton, Delhi, and Farmingdale and at the colleges of agriculture and technology at Cobleskill and Morrisville. In addition, the colleges at Alfred, Cobleskill, and Farmingdale offer programs leading to bachelor's degrees. The Fashion Institute of Technology in New York City offers associate, bachelor's, and master's degrees.

The State University of New York was established in 1948. Its headquarters are in Albany.

New York City, the largest city in the United States, is a world center of business, culture, and trade. This photo shows Manhattan Island from the East River. The wide building in the foreground is United Nations Headquarters. Behind it, topped with arches and a spire, is the Chrysler Building.

New York City

New York City is the largest city in the United States and one of the largest in the world. It ranks as one of the world's most important centers of business, culture, and trade. It is also the home of the United Nations (UN). Much of what happens in New York City affects what happens throughout the United States and in other parts of the world.

New York City has a population of about 8 million. It has more than twice as many people as any other city in the United States. In fact, only 10 states—not including New York state—have more people than New York City. Ever since Dutch colonists settled the area at the southern tip of Manhattan Island in 1625, New York has been the destination of immigrants from throughout the world.

During the 1800's and the early 1900's, millions of Europeans seeking a better life in a free land poured into New York City. The Statue of Liberty, which was erected in New York Harbor in 1886, became the symbol of this new life.

Since the mid-1900's, many blacks from the Southern States and Spanish-speaking Americans from Puerto Rico have moved into the city. In the 1980's and 1990's, a new wave of immigrants flowed into New York City. These immigrants included many people from China, Central America, and Caribbean lands.

The business, financial, and trading organizations in New York City play a major role in the economy of the nation and of the world. The banks, stock exchanges, and other financial institutions in New York City's famous Wall Street area help provide the money used by most large United States corporations. The skyscrapers that form the spectacular New York skyline house the home offices of many national and international business firms. The docks, the warehouses, and the shipping companies that line New York's huge natural harbor handle much of the nation's imports and exports. Two major airports serve numerous international airlines.

As a cultural center, New York City has no equal in the United States. Most of the publishing houses that select and produce the nation's books have their headquarters in New York. The city's world-famous Broadway area is the center of professional theater in the United States. New York is also the home of some of the nation's largest museums and art galleries. The city displays beautiful churches in the Gothic Revival style, gleaming modern skyscrapers, and other interesting styles of architecture. A great number of outstanding orchestras and opera and dance companies give performances at the Lincoln Center for the Performing Arts. Because of its prominence as a cultural and entertainment center, New York City is sometimes called the "Big Apple."

But along with all its greatness, New York City has many serious problems. Thousands of immigrants have not found the opportunities they had hoped for in New York. About a million New Yorkers receive welfare aid, and thousands live in slums. Other problems include air pollution, traffic jams, crime, drug abuse, racial conflicts, and increases in the cost of living in the city. All these

problems are driving many families—especially middle-class families—to the suburbs.

New York City remains one of the most interesting and exciting cities in the United States. In fact, many people consider it the most fascinating city in the world.

The city

New York City lies in the southeast corner of New York state at the mouth of the Hudson River. It covers about 322 square miles (834 square kilometers). The city is divided into five areas called *boroughs*—Manhattan, the Bronx, Queens, Brooklyn, and Staten Island. Each is a county of New York state.

Manhattan, the smallest borough in area, covers 24 square miles (62 square kilometers). It occupies a long, narrow island bordered by the Hudson River on the west, the East River on the east, the Harlem River on the north and northeast, and Upper New York Bay (the mouth of the Hudson) on the south.

The Bronx lies across the Harlem River from Manhattan and covers 44 square miles (114 square kilometers). It extends north along the Hudson River and east along the East River. It is the only borough not separated from upstate New York by water.

Queens, the largest borough in area, occupies 112 square miles (290 square kilometers) on the northwest corner of Long Island. The East River separates Queens from the Bronx to the north and from Manhattan to the west.

Brooklyn covers 82 square miles (212 square kilometers) on the southwest tip of Long Island. It lies south and southwest of Queens and southeast of Manhattan across the East River.

Staten Island, formerly called the borough of Richmond, occupies a 60-square-mile (155-square-kilometer) island in Upper and Lower New York bays. It lies west of Brooklyn and southwest of Manhattan.

The state of New Jersey is directly west of New York City. It lies across two waterways, Arthur Kill and Kill Van Kull, from Staten Island; across Upper New York Bay from Brooklyn; and across the Hudson River from Manhattan and the Bronx.

Each of New York City's boroughs has a large population, important businesses and industries, and many fine educational and cultural institutions. Within the five boroughs are more than 100 neighborhoods, such as Manhattan's Chinatown, Greenwich Village, and Harlem. These neighborhoods are not official government units. They have similar types of housing or people with similar backgrounds or lifestyles.

The New York City metropolitan area spreads into northeastern New Jersey and southern New York state. Hundreds of thousands of people who work in New York live in suburban residential communities in the city's metropolitan area. Many industrial cities also lie in the area surrounding New York City.

Manhattan is the oldest and most important borough of New York City. It is about 13 ½ miles (21.7 kilometers) long and 2 ⅓ miles (3.8 kilometers) wide at its widest point. But about 1 ½ million people live there.

The borough of Manhattan has New York City's tallest buildings, some of the nation's largest schools and colleges, and the world's most famous financial and theatrical districts.

Facts in brief

Population: *City*—8,008,278. *Metropolitan area*—9,314,235. *Consolidated metropolitan area*—21,199,865 (12,689,865 in New York, 6,661,750 in New Jersey, 1,801,948 in Connecticut, and 46,302 in Pennsylvania).

Area: *City*—322 mi² (834 km²). *Metropolitan area* (excluding inland water)—1,148 mi² (2,973 km²). *Consolidated metropolitan area* (excluding inland water)—10,457 mi² (27,084 km²).

Climate: *Average temperature*—January, 33 °F (1 °C); July, 74 °F (23 °C). *Average annual precipitation* (rainfall, melted snow, and other forms of moisture)— 44 in (112 cm). For information on the monthly weather in New York City, see **New York** (Climate).

Government: Mayor-council. *Terms*—4 years for the mayor, the City Council president, controller, and the 51 members of the City Council.

Founded: 1625. Incorporated as a city in 1653.

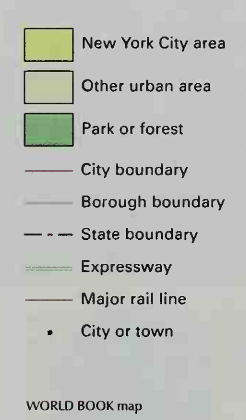
New York City's flag is blue, white, and orange. The colors represent the area's Dutch flag of colonial times.

The seal of New York City features an American eagle, an English sailor, and a Manhattan Indian.



WORLD BOOK map

New York City lies at the center of a *megalopolis,* a group of metropolitan areas. These urban areas extend from Boston to Washington, D.C.

New York City metropolitan area

The metropolitan area of New York City includes parts of northeastern New Jersey and southeastern Connecticut. Hundreds of thousands of people who work in New York City do not live there. They commute daily from nearby areas, chiefly by train. The map shows major expressways and railroad lines.

WORLD BOOK map

Manhattan is an area of many sharp contrasts. Some of the richest people in the United States live in its beautiful town houses and luxurious high-rise apartment buildings. But some of the nation's poorest people occupy its *tenements* (shabby apartment buildings) and low-rent public housing projects. Most of Manhattan is covered with concrete and asphalt, and skyscrapers make many of its streets look like deep canyons. But the borough's Central Park provides 840 acres (340 hectares) of grass, trees, and rolling hills. Manhattan has some of the world's most exclusive shops and largest department stores. They attract shoppers from all parts of the country. But the borough also has tiny neighborhood shops that sell to nearby residents.

New York City's Financial District lies at the southern tip of Manhattan and is centered on Wall and Broad streets. Many large banks, brokerage houses, and stock exchanges have their headquarters along the district's narrow streets. The World Trade Center is in the Financial District along the Hudson River. Twin 110-story towers that once were part of the center were destroyed in 2001 in the worst terrorist attack in U.S. history.

Broadway, one of the city's longest and best-known streets, begins in the Financial District and runs north and northwest across Manhattan. On the east side of Broadway, a few blocks north of the Financial District, stands the Municipal Civic Center. The center includes City Hall, courthouses, and other government buildings.

Residential and commercial neighborhoods lie to the north and northeast of the Municipal Civic Center. These neighborhoods include Chinatown, Little Italy, and the Lower East Side. Both Chinatown and Little Italy have some of the city's oldest tenements. They also have many restaurants that specialize in Chinese or Italian food. For many years, most immigrants to New York City have first settled on the Lower East Side because of its many low-rent tenements. Jews once made up the largest group in the area. Today, Puerto Ricans are the largest single group on the Lower East Side. Other groups, especially students and artists, have also been attracted to the Lower East Side by the low rents.

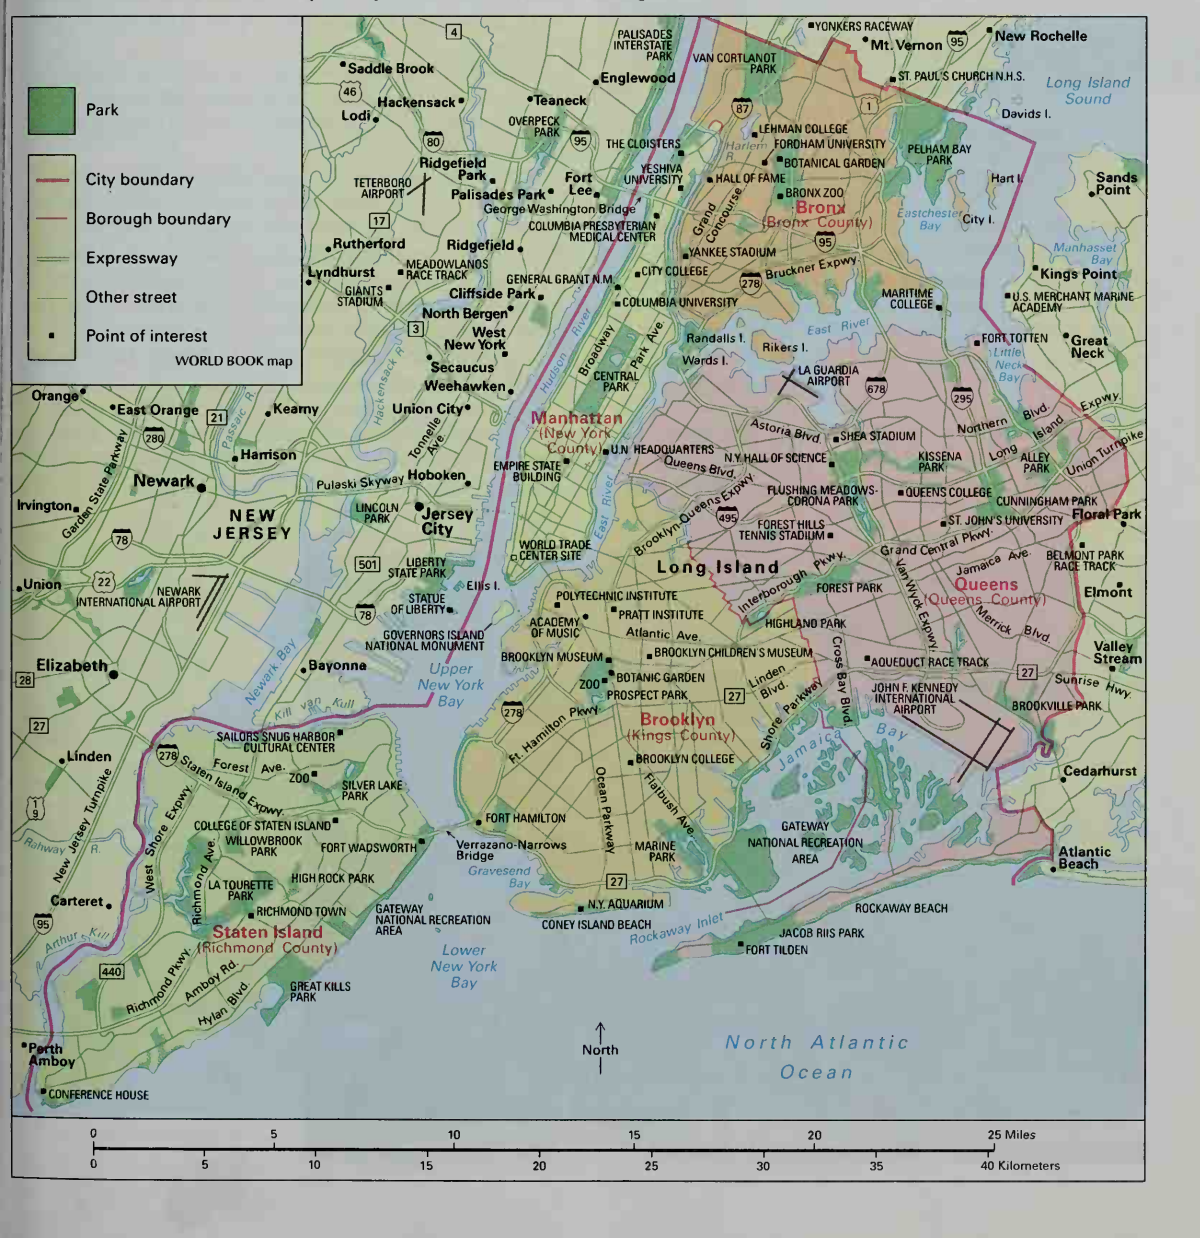
Greenwich Village lies west of Broadway and the Lower East Side. It attracts artists, writers, musicians, actors, and other people in the arts. The Village has a variety of housing, many interesting shops and art galleries, and several small theaters. Many people in the arts also live in the SoHo area, south of the Village.

North of Greenwich Village, Manhattan is laid out in a regular pattern of cross streets. Avenues run north and south, and numbered streets run east and west. Broadway cuts diagonally across this pattern.

Some of New York City's largest department stores are in the Herald Square and Greeley Square areas, where Broadway crosses the Avenue of the Americas (formerly Sixth Avenue). East of the department stores, on 34th Street, is the famous, 102-story Empire State Building, for many years the world's tallest building. The Garment District, center of the city's large clothing industry, lies north of Herald and Greeley squares.

The intersection of Broadway and Seventh Avenue,

between 42nd and 47th streets, forms world-famous Times Square, the heart of the New York Theater District. Since the late 1960's, the Times Square area has been undergoing redevelopment. A number of large office buildings have been constructed there. But the area remains the Theater District because many of the new buildings house theaters. Plans for further redevelopment also seek to maintain the area's theatrical activities.



United Nations Headquarters occupy 18 acres (7.3 hectares) along the East River between 42nd and 48th streets. The UN's beautiful modern buildings have become New York City landmarks.

Rockefeller Center is another of the city's landmarks. It lies on Fifth Avenue between 48th and 51st streets. The center consists of 21 buildings covering about 25 acres (10 hectares). It is the world's largest privately owned business and entertainment facility. The center's buildings include the RCA Building, which is 850 feet (259 meters) high, and the 5,900-seat Radio City Music Hall, the world's largest indoor theater. Many of New York City's finest stores line Fifth Avenue both north and south of Rockefeller Center.

Central Park, which runs from 59th to 110th streets between Fifth Avenue and Central Park West, separates Manhattan's Upper East Side and Upper West Side. The Upper East Side has long been the most fashionable neighborhood in Manhattan. At one time, the area had many town houses that were owned by the city's richest residents. Today, cultural organizations and United Nations delegations occupy many of these buildings, and

New York City

This map shows the five boroughs of New York City—the Bronx, Brooklyn, Manhattan, Queens, and Staten Island. These boroughs are also counties of the state of New York. County names appear in parentheses under each borough name.

© Allyn Baum, Photo Researchers

Outdoor food markets and other small shops serve customers in many New York City neighborhoods. This fruit and vegetable market is in the Little Italy section of Manhattan.

most of the people in the area live in luxurious apartment buildings. The Upper West Side has been chiefly a middle-class neighborhood. It includes many apartment houses, hotels, tenements, and long blocks of brick and brownstone row houses. In the late 1900's, however, housing prices rose sharply in the area. Many of the Upper West Side's best buildings now rival the Upper East Side in price.

Harlem, the best-known black community in the United States, lies north of Central Park. It has long been a center of African American business and cultural activities. A series of model housing projects extends along the Harlem River at the northern edge of Harlem. But much of the area consists of tenements.

Morningside Heights, the site of Columbia University and several other educational, cultural, and religious institutions, lies west of Harlem along the Hudson River. City College of the City University of New York lies north of Morningside Heights, in an area that was once the country estate of the American statesman Alexander Hamilton.

Washington Heights and Inwood are at the northern tip of Manhattan. Both have aging tenements, as well as modern housing projects. Washington Heights was formerly inhabited by many Jewish immigrants who fled Europe to escape Nazi leader Adolf Hitler's brutal persecution of Jews in the 1930's and 1940's. Today the area is largely populated by immigrants from the Dominican Republic. The Columbia-Presbyterian Medical Center; Yeshiva University; and the Cloisters, a museum featuring European art of the Middle Ages, are in Washington Heights.

Brooklyn has more people than any other borough of New York City. If Brooklyn were an independent city, its population of about 2 $\frac{1}{2}$ million would make it the nation's fourth largest city.

Brooklyn is an important port and industrial center. Hundreds of ships carry freight to and from Brooklyn's docks each year. The borough's factories, most of which are along the waterfront, make a wide variety of goods.

Housing in Brooklyn ranges from large houses and towering apartment buildings to small cottages and rundown rooming houses. But most Brooklynites live in row houses and small apartment buildings that line the streets throughout the borough.

Downtown Brooklyn, the borough's main business and shopping district, lies near the approaches to the Brooklyn and Manhattan bridges. These two bridges are the main links between Brooklyn and Manhattan. A third

Brooklyn includes hundreds of streets lined with long blocks of row houses and small apartment buildings. Brooklyn has the largest population of any of the five boroughs of New York City.

© Van Bucher, Photo Researchers

The Bronx extends along the Hudson River north of Manhattan. Most people in the Bronx live in large apartment buildings. But the borough also has many old private homes.

bridge, Williamsburg Bridge, also connects the two boroughs. Brooklyn's downtown area has large department stores, tall office buildings, and several schools and colleges. Flatbush Avenue, one of the main downtown streets, begins at the Manhattan Bridge and runs through the heart of the borough.

Two of Brooklyn's oldest neighborhoods, Brooklyn Heights and Cobble Hill, lie along the East River west of the downtown area. These neighborhoods have more than 1,000 houses over 100 years old. Many of the houses stand on handsome, treelined streets and are carefully preserved.

The site of the former U.S. Naval Shipyard, which had been one of Brooklyn's chief industries, lies northeast of downtown. The Navy gave up the yard in 1968, and the area is now being made into an industrial park for factories, shipbuilding, and warehouses.

Bedford-Stuyvesant, east of the downtown area, is the largest black neighborhood in New York City. Blocks of well-kept row houses and many fine churches are found throughout the neighborhood. In contrast, Brownsville, a black and Puerto Rican neighborhood which lies southeast of Bedford-Stuyvesant, is the city's worst slum area. It has few well-maintained areas, and many of its buildings are abandoned and decaying.

Prospect Park, in the center of Brooklyn, is one of the finest landscaped parks in the nation. The park is designed so that its lakes, meadows, woods, and other features look larger than they are. Flatbush, once a fashionable suburb of Brooklyn, begins on the southeast edge of the park. Large homes built during the 1890's and early 1900's line many of its shaded streets.

Coney Island lies at the southern tip of Brooklyn. The area once was an island, but land has been filled in to make it a peninsula. In summer, many New Yorkers ride subways to Coney Island's beaches and to its famous Boardwalk, which has side shows, souvenir stands, and other attractions. At one time, Coney Island also had great amusement parks, but they have been replaced by housing developments. In the late 1900's, large numbers of immigrants from Russia settled in Coney Island.

The Bronx has a population of about 1 $\frac{1}{3}$ million and is chiefly a residential borough. The western part of the Bronx consists of a series of hills and valleys crossed by boulevards. A major boulevard in the Bronx, the Grand Concourse, runs north and south through the area. It is lined with apartment houses, commercial buildings, and stores. The eastern section of the borough is a broad plain, with peninsulas extending into the East River and Long Island Sound.

Bronx Park lies in the center of the Bronx. It includes the Bronx Zoo (officially the International Wildlife Conservation Park), one of the best-known zoos in the United States, and the New York Botanical Garden, an important scientific institution.

Fordham University and Lehman College have handsome campuses to the west of Bronx Park. The campus of Bronx Community College of the City University of New York includes the Hall of Fame, which honors the memory of great Americans (see **Hall of fame**).

One of the most fashionable neighborhoods in the Bronx is Riverdale, in the northwest corner of the borough along the Hudson River. It has tall apartment buildings, estates and other large homes, and exclusive pri-

© Stan Ries

Queens is the largest borough in area. It has many unattached single-family homes, large apartment buildings, housing projects, and busy expressways. Much of the borough's development has occurred since the 1940's.

© Kay Honkanen from Carl Östman

Staten Island has several sections that look more like small towns than like parts of a major city. Staten Island is the only borough not connected to Manhattan by a bridge or a tunnel. The famous Staten Island ferries link the two boroughs.

vate schools. One of the poorest neighborhoods in the Bronx is Morrisania, which lies south of Bronx Park and east of Grand Concourse Boulevard. The area has many run-down and abandoned buildings.

Two huge housing developments lie in the eastern part of the Bronx. Parkchester, built from 1938 to 1942, is a rental and condominium development southwest of Bronx Park. Co-op City, built from 1968 to 1970, is in the northeast corner of the borough and is owned by its residents. Co-op City has more than 15,000 apartments, a large shopping area, and landscaped areas.

City Island lies east of the Bronx in Long Island Sound. It has several boat clubs and resembles a New England village. Edgewater Park and Silver Beach are at the southeastern tip of the Bronx. They were once summer resort communities. But the cottages in these areas have been winterized for year-round use.

Queens, with about $2\frac{1}{4}$ million residents, ranks second in population among New York City's boroughs. Queens grew rapidly from 1910 to 1930, when subways were built to connect it with Manhattan. A second period of fast growth began in the late 1940's, when the subways were extended, new highways were built, and two major airports were developed in the borough. Today, huge housing developments and busy expressways are the major features of Queens.

Much of the borough's industry is concentrated near the East River in an area called Long Island City. The area lies just south of the Queensboro Bridge, which connects Queens and Manhattan. It has giant rail yards and many industrial plants and warehouses. Maspeth southeast of Long Island City, also has large industrial plants, as well as pleasant residential areas.

Forest Hills lies near the center of Queens. Within this neighborhood is Forest Hills Gardens, an attractive housing and shopping area built in 1910. Forest Hills Gardens was intended for families with middle incomes. But it immediately became—and has remained—a community for the wealthy.

Northeast of Forest Hills is Flushing Meadow-Corona Park, site of the New York World's Fairs of 1939-1940 and 1964-1965. The park has several features left from the fairs, including a botanical garden, an indoor ice-skating rink, and a science museum.

La Guardia Airport, one of New York City's two main airports, is northwest of Flushing Meadow-Corona Park, across Flushing Bay. The neighborhood of Flushing, northeast of the park, has a busy shopping area and many large apartment houses.

Jamaica, in southeastern Queens, is one of the borough's chief commercial centers. It has large shopping and business areas and both rich and poor residential sections.

John F. Kennedy International Airport, the city's largest airport, lies immediately south of Jamaica. It has been expanding since 1942 and has become the borough's largest single source of employment.

Rockaway is a long peninsula that forms the southern border of Jamaica Bay. It has a sandy beachfront, attractive private homes, and modern apartment buildings. It also has many summer cottages, some of which are occupied the year around.

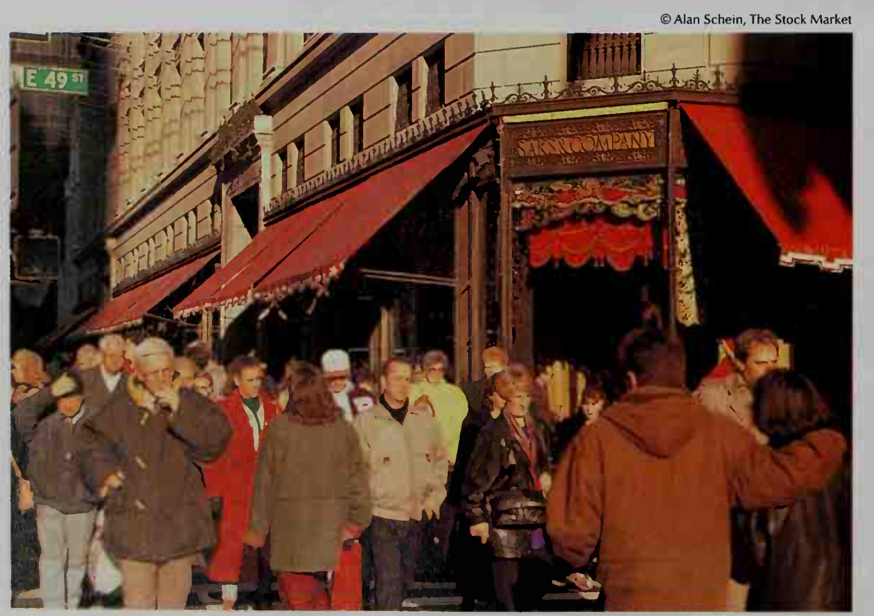
Staten Island has about 440,000 residents, making it the smallest borough in population. It is the only borough not connected to Manhattan by a bridge or a tunnel. Until the completion of the Verrazano-Narrows Bridge in 1964, much of the island consisted of small farms and undeveloped areas. The bridge, which connects Staten Island with Brooklyn, has led to the construction of new housing and to industrial growth. But many communities on Staten Island still look more like suburban towns than like sections of a major city.

St. George, on the northeast tip of Staten Island, serves as the downtown section of the borough and is the site of the Staten Island Ferry Terminal. The famous ferries carry automobiles and passengers between Staten Island and Manhattan and provide the only direct link between the two boroughs. A U.S. Coast Guard station, government and private office buildings, and a variety of stores are also in St. George.

The eastern shore of Staten Island is a decaying industrial area. But there are handsome homes and several colleges on the wooded hills just inland.

Parks and beaches line the southeastern and southern coasts of the island. Richmond Town, in the center of Staten Island, is being restored to show how it developed during the 1600's, 1700's, and 1800's.

The industrial communities of Mariners Harbor and Port Richmond lie on the north coast of Staten Island. One of the three bridges that connect Staten Island and New Jersey is near Mariners Harbor. The others are on the northwest coast and near the island's southern tip.



Small islands. There are several small islands in the waters surrounding New York City. The most famous is Liberty Island, site of the city's greatest landmark—the Statue of Liberty. Ellis Island lies near Liberty Island. The United States Immigration Service used the island until 1954 as a port of entry and a detention and deportation center. Liberty and Ellis islands now form the Statue of Liberty National Monument. Governors Island, at the mouth of the East River, was the site of a military installation from the late 1700's until 1997. Roosevelt, Wards, Randalls, and Rikers islands are in the East River. Hospitals, prisons, and other institutions have been built on these islands. An aerial cable car system links Roosevelt Island and Manhattan. See **Ellis Island; Liberty Island.**

Metropolitan area. The New York City Metropolitan Statistical Area consists of the five boroughs and Putnam, Rockland, and Westchester counties in southern New York.

New York City's metropolitan area is the largest of the metropolitan areas that make up the New York-Northern New Jersey-Long Island consolidated metropolitan area. This region also includes the Dutchess County, Nassau-Suffolk, and Newburgh metropolitan areas in New York, six metropolitan areas in New Jersey, five metropolitan areas in Connecticut, and one county in Pennsylvania. The region has about 21 million people.

Many communities in the New York area are commuter suburbs. Their residents work in New York City and commute by automobiles, buses, ferries, railroads, and subways. Some of these suburbs, such as White

Manhattan's Central Park attracts many people on warm summer days. The huge park has athletic fields, fountains, gardens, a lake, playgrounds, wooded areas, and a zoo.

Plains in Westchester County, have become important centers of business and shopping outside the central city. Other communities in the New York area are industrial cities. They provide enough jobs so that most of their residents work in the communities themselves. Some of these industrial communities, such as Newark and Jersey City in New Jersey, are also experiencing the problems of pollution, poverty, and urban decay that affect New York City.

People

The people of New York City represent nearly all nationalities. During the 1650's, only about 1,000 people lived in the Dutch colony of New Amsterdam on Manhattan Island. But even then, 18 languages were spoken in the colony. Since that time, people from throughout the world have brought their skills, traditions, and ways of life to New York City.

People move to New York City for many reasons. Many are attracted by the city's job opportunities. Other people come to attend the city's schools and colleges or to enjoy its many cultural activities. Still others come simply because they want to be a part of a large, exciting city.

Ethnic groups. Five ethnic groups—black, Irish, Italian, Jewish, and Puerto Rican—make up about 80 percent of New York City's people. Neighborhoods consisting largely of people from these and many smaller groups are scattered throughout the city. Originally, most of the people in ethnic groups shared direct ties to a country, a language, or a common past with other members of their group. Today, such ties are less common. But the people still have some unity through such things as common religious beliefs and common economic interests.

Blacks are the largest ethnic group in New York City and make up about 27 percent of the city's population. New York has about 2,100,000 blacks, more than any other city in the United States. Most of the blacks are migrants—or the children of migrants—from the rural South. But many have also come from the West Indies. A large number of New York City's blacks live in poor neighborhoods. Many of them have been prevented from leaving the ghetto areas by discrimination in jobs and housing and by a lack of education. But more and more black New Yorkers are becoming part of the city's middle class. Thousands of blacks live in racially integrated areas, and thousands more live in middle-class black neighborhoods.

Jews make up about 15 percent of the population of New York City. New York's Jews come from many countries. They are considered to be an ethnic group, however, because most of them live in Jewish neighborhoods and have similar religious and social beliefs. Many Jews own businesses. Many others work in garment factories, in offices, and in the legal, medical, and teaching professions.

About 14 percent of New York City's people are of Italian ancestry. New York Italians are known for their well-kept homes and for their close neighborhood ties. They are the largest single group in the city's construction industry, and they play a key role in the restaurant and the wholesale and retail food-marketing industries. Many Italians have civil service jobs in the city's park, public works, sanitation, police, and fire departments.

Most of New York City's Italians belong to the Roman Catholic Church.

Puerto Ricans make up about 12 percent of New York City's population. They are the largest of several Spanish-speaking ethnic groups in the city. Large numbers of Puerto Ricans began to come to New York in the 1950's. Many of them found jobs as unskilled workers, especially in hospitals, hotels, and restaurants. At first, nearly all Puerto Ricans lived in East Harlem in Manhattan. But today, Puerto Rican neighborhoods are found in all the boroughs. Neighborhood associations, large church organizations, and the public school system have all developed programs to help newly arrived Puerto Rican people learn English and adjust to life in the city.

The Irish have traditionally been active in New York City's political life. During the late 1800's and early 1900's, they controlled the city government. But the percentage of Irish people in the city has dropped from 30 percent in 1870 to about 9 percent today. As a result, the Irish have lost much of their political power. But they are still the largest single group employed by New York City's police and fire departments. The Irish are also among the leaders of the Roman Catholic Church in the city.

New York City has many other ethnic groups besides the five major ones. Other large ethnic groups in the city include Chinese, English, Germans, Greeks, and Russians.

Housing in New York City differs in several ways from that in most other cities of the United States. About 65 percent of New York's families live in apartment buildings or hotels. In other cities, most people live in one- or two-family houses. About 70 percent of the families in New York rent their homes. In other U.S. cities, most families own their homes. About half of the housing in New York City was built before 1940. Most other cities in the United States have a far larger percentage of newer housing.

New York City has long been a leader in housing reform. In 1867, New York state, at the request of the city, passed the nation's first tenement house law. The law set minimum standards for room sizes and for ventilation and sanitation facilities. In 1943, the city passed a rent control law to protect tenants in privately owned buildings from unfair rent increases. Rent control laws passed in the 1970's were intended to help landlords make a reasonable profit. But many landlords complain that the higher rents they may charge do not cover rising costs. New York City has also built many public housing projects. Today, about 170,000 low-income families live in city-owned public housing.

But housing remains one of New York City's most serious and difficult problems. Many old buildings are becoming unusable, and the demand for new housing, especially among poor people, is rapidly increasing. Yet steadily rising construction costs and a lack of large areas of open land make the development of new housing difficult.

Education. New York City has the largest public school system of any city in the United States. The public school system includes more than 960 schools with more than 1 million students. An additional 300,000 students attend hundreds of privately operated schools in New York City.

The mayor controls the city's public school system. The mayor appoints a chancellor to oversee the system

Jews form a large ethnic group in New York City. The people above are Hasidic Jews, who dress in a style that developed in Eastern Europe in the 1800's. Many Hasidic Jews live in Brooklyn.

and appoints 8 members of a 13-member Board of Education. The five borough presidents appoint the other 5 board members. The 5 members appointed by the borough presidents must be parents of students attending a public school in the system.

New York City has neighborhood high schools like those found in most other cities. But it also has a wide variety of specialized high schools that prepare students for a specific occupation or for further training at the college level. These institutions include schools of automobile mechanics, aviation, the performing arts, printing, and science. Grade schools in poor neighborhoods have special programs to aid underprivileged children and children who do not speak English.

Many of New York City's colleges, universities, and other institutions of higher learning are world famous. One of the largest universities in the world, the City University of New York, is operated by the city with state and federal assistance. The university consists of nine senior colleges, seven community colleges, a graduate school, a law school, a medical school, and a technical school. The university has a total enrollment of about 180,000 students.

Columbia University, founded in 1754, is the oldest private university in New York City. The city's largest private university is New York University. Fordham and St. John's universities are important Roman Catholic schools.

New York City also has many smaller and more specialized institutions of higher education. The New School University deals mainly with adult education. Rockefeller University specializes in advanced research in biology and medicine. Pratt Institute and Cooper Union are largely devoted to architecture, engineering, and the fine arts. Other schools specialize in law, medicine, and social work.

Social problems. New York City has many of the same problems other cities have. But it is so much larger than other cities that the problems are greatly magni-

fied. New York's major social problems include poverty, crime and drug addiction, and racial conflict.

Poverty is one of New York City's most expensive problems. The city budgets more than $4 billion a year on welfare programs to provide food, clothing, housing, medical care, and other benefits for about 1 ½ million people. Yet unskilled immigrants continue to move into the city, while the demand for unskilled labor continues to decline. As a result, the problem of poverty is difficult to solve.

Because of its large population, New York City has more crime than any other U.S. city. But the crime rate—the number of crimes committed for every 100,000 residents—is actually lower in New York than in many other cities. New York's crime and drug addiction problems are closely related. About half the drug addicts in the United States live in New York City. They commit many of the city's burglaries and attacks on individuals to get money for drugs.

Racial conflicts in New York City have had many causes. A major cause has been discrimination against blacks, Puerto Ricans, and other minority groups in jobs and housing. Many minority group members have had trouble obtaining well-paying jobs. Many also have had difficulty moving out of segregated neighborhoods and into neighborhoods where most of the people are white and of European ancestry. When members of a minority group have begun moving into such a neighborhood, the white residents often have begun moving out. In this way, segregated housing patterns have continued, and the chances for conflicts between the groups have increased.

Economy

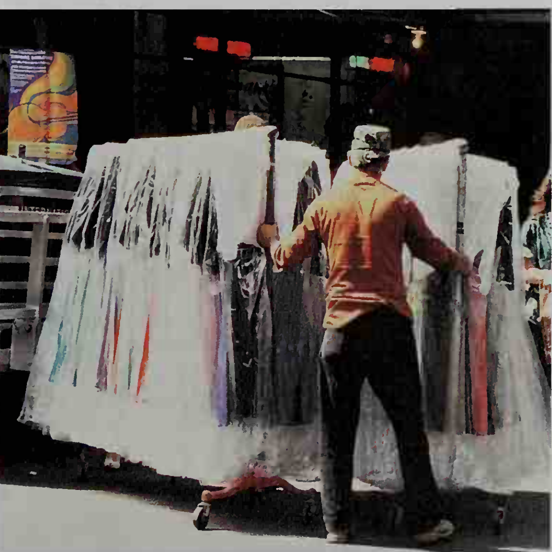
New York City is one of the world's most important centers of industry, trade, and finance. Businesses, industries, and government agencies in the metropolitan area provide about 7 million jobs. About 3 ⅓ million of these jobs are within the city itself.

The economies of both New York City and its suburbs are growing. But since the 1940's, the economy of the suburban area has grown much faster than that of the city. The construction of new highways, a growing labor force, and the availability of land in the suburbs have led many businesses and industries to move from the crowded central city to the suburbs.

The types of jobs available in New York City have also been changing since the 1940's. The number of jobs for unskilled workers has decreased greatly because many industries have moved to the suburbs. This decrease has created a serious economic problem because most immigrants to the city are unskilled. At the same time, the number of jobs for skilled workers, especially office workers, has increased. But many of these jobs are being filled by people who live in the suburbs and commute to the city.

Industry. New York City ranks third after Los Angeles-Long Beach and Chicago among the leading manufacturing centers in the United States. It has about 17,000 industrial plants. They employ about 430,000 workers. The most important industries are (1) printing and publishing and (2) clothing production.

New York City is one of the nation's chief printing and publishing centers. It has more printing plants than any other U.S. city. New York does about a sixth of the nation's printing and publishing. It publishes about a third of the books published in the United States. The city's printing and publishing industry employs about 93,000 people.



New York City's clothing industry is centered in Manhattan's famous Garment District, southwest of Times Square. There, hundreds of factories employ about 119,000 people. But the garment industry has been declining in New York City. Many factories have closed. Other factories have left the Garment District because of the rising costs of doing business in the heart of Manhattan.

Other leading manufacturing industries include those that produce chemicals, food products, furniture, machinery, metal products, paper products, and textiles. The construction industry is also important. About 87,000 people in the city work in jobs related to the industry.

Trade. New York City's port, officially called the Port of New York and New Jersey, is one of the world's largest and busiest seaports. It employs about 200,000 people. The port ranks second to the Port of Los Angeles in total value of cargo handled annually. The port's cargo includes foreign imports and exports, and goods going to and coming from other U.S. ports.

New York City's port activity has been declining since the late 1940's. One reason for the decline in port activity has been the growth of other international seaports in the United States, especially along the Great Lakes. The opening of the St. Lawrence Seaway in 1959 allowed ships that previously docked in New York to reach Great Lakes ports.

Large amounts of cargo are also handled at airports in the New York City area. Foreign air freight goes through Kennedy Airport and nearby Newark International Airport in New Jersey. Domestic cargo is handled at Kennedy, La Guardia, and Newark airports.

The Garment District in Manhattan is the center of New York City's important clothing industry. The district's streets are crowded with workers moving racks of clothing.

The New York Stock Exchange, *right,* stands at the corner of Wall and Broad streets in the heart of New York's Financial District. The cloaked statue of George Washington, *left,* marks the site where he was inaugurated as the first president of the United States in 1789.

The Port Authority of New York and New Jersey, a self-supporting agency of the states of New York and New Jersey, operates New York City's major airports and docking facilities, as well as several other transportation facilities. See **Port Authority of New York and New Jersey.**

Wholesale trade plays an important part in New York City's economy. The city has about 20,300 wholesale firms. They employ over 240,000 people. The city's wholesale grocery and dry-goods businesses are the largest in the United States.

Retail business firms in New York City have more than 370,000 employees. The nation's largest retail center is in midtown Manhattan. The department stores and specialty shops in midtown Manhattan are known throughout the world.

Finance. More of the nation's largest and most important financial institutions have their headquarters in New York City than in any other city. Banks, brokerage houses, insurance companies, real estate firms, stock exchanges, and other financial organizations in New York employ about 495,000 people. Unlike most industries in the city, the financial organizations offer a steadily increasing number of jobs.

The most famous financial institution in New York City is the New York Stock Exchange, at the corner of Broad and Wall streets in the heart of the Financial District. It is the largest stock exchange in the United States. The American Stock Exchange, one of the nation's largest exchanges, is also in the Financial District. Many large brokerage houses have their headquarters near the exchanges.

New York City's banks are among the biggest in the world. These banks help finance business ventures throughout the United States and in many parts of the world. The largest of the city's banks are in the Financial District.

Transportation. New York City has a huge, complicated transportation system. Much of the system is centered in the area of Manhattan that is south of Central Park. About $3\frac{1}{2}$ million people travel to and from that area each working day. Nearly all forms of air, land, and water transportation serve the city.

An extensive highway system has been developed to carry automobiles, buses, and trucks into, out of, and through New York City. The city's major expressways include the Major Deegan Expressway in the Bronx, the Shore and Gowanus parkways in Brooklyn, and Grand Central Parkway and the Long Island Expressway in Queens. Franklin D. Roosevelt Drive carries traffic along the eastern edge of Manhattan.

New York City includes 65 square miles (168 square kilometers) of inland water, so many bridges and tunnels are needed to link the city's boroughs. The famous Brooklyn Bridge crosses the East River and connects Brooklyn and the southern tip of Manhattan. It was completed in 1883 and declared a national historic landmark in 1964. In addition to the Brooklyn Bridge, six other bridges cross the East River. They are, from south to north, the Manhattan, Williamsburg, Queensboro, Triborough, Bronx-Whitestone, and Throgs Neck bridges. The Y-shaped Triborough Bridge links Manhattan, the Bronx, and Queens.

The Harlem River is spanned by High Bridge, Harlem Bridge, Henry Hudson Bridge, Alexander Hamilton Bridge, and several smaller bridges. High Bridge, which was opened in 1848, is one of the oldest bridges in the city.

One bridge, the George Washington Bridge, crosses the Hudson River and connects Manhattan and New Jersey. The Bayonne Bridge stretches 1,675 feet (511 meters) over Kill Van Kull channel between Staten Island and New Jersey. It has one of the longest arch spans in the world. Goethals Bridge and Outerbridge Crossing, which cross Arthur Kill channel, also connect Staten Island and New Jersey.

The Verrazano-Narrows Bridge, which links Staten Island and Brooklyn, opened in 1964. Its 4,260-foot (1,298-meter) suspension span is one of the longest in the world.

The Queens Midtown Tunnel runs under the East River and connects Manhattan and Queens. The 9,117-foot (2,779-meter) Brooklyn-Battery Tunnel links the southern tip of Manhattan with Brooklyn. The Lincoln and Holland tunnels run under the Hudson River between Manhattan and New Jersey. In addition to these tunnels for motor vehicles, several tunnels carry subway trains under the East River. Four rapid transit tunnels called the PATH tunnels run under the Hudson River between Manhattan and New Jersey. See **Hudson River tunnels.**

New York City has three subway systems. They operate on about 230 miles (370 kilometers) of track. The Interborough Rapid Transit (IRT), the city's first subway, opened in 1904. The IRT operates in Manhattan and in a large part of the Bronx. It has branch lines into Brooklyn and Queens. The Independent Subway (IND) has lines in all the boroughs except Staten Island. The Brooklyn-Manhattan Transit Company (BMT) has lines in Brooklyn, Manhattan, and Queens. Buses operate throughout the city. The New York City Transit Authority, a combined city and state agency, controls all the subways and most bus lines that operate in the city. Crowded Manhattan is famous for its huge fleet of taxicabs.

Two major railroad stations serve New York City—Grand Central Terminal (sometimes called Grand Central Station) at 42nd Street and Park Avenue and Pennsylvania Station on 31st Street at Seventh Avenue. In the mid-1960's, the upper level of Penn Station was torn down and replaced by Madison Square Garden, but trains continue to operate beneath street level. Before the rapid growth of air travel in the 1950's, hundreds of thousands of railroad passengers from all parts of the country passed through Grand Central and Penn stations each day. Today, hundreds of thousands of people still use the stations. Most of them, however, are commuters.

La Guardia, Kennedy, and Newark airports handle most of New York City's commercial air traffic. La Guardia serves domestic and Canadian airlines, and Kennedy and Newark serve domestic and international airlines. The New York City area also has numerous smaller airports.

Communications. New York City is the nation's most important center for mass communications. More publishing and broadcasting companies have their headquarters in New York than in any other city in the United States.

Three general newspapers—the *New York Daily News,* the *New York Post,* and *The New York Times*—are published daily in New York City. The *Times* is one of the world's best-known papers and is often used as a reference source. The city has many community, foreign-language, and trade and union papers. Daily papers printed in Spanish, Russian, Polish, Greek, and Chinese have large circulations. *The Wall Street Journal* is the major business paper. A national newspaper, its circulation of about 2 million is the largest of any paper in the United States.

Most major national magazines and many specialized magazines have their editorial offices in New York City. New York also has more book publishers and advertising agencies than any other city.

New York City has nearly 60 radio and television stations. It serves as the headquarters of three of the nation's four major broadcasting networks. The three networks are Capital Cities/ABC Inc., CBS Inc., and the National Broadcasting Company (NBC). They provide both television and radio programming to stations throughout the United States. The fourth network—Fox Broadcasting Company—originates many of its television programs from a studio in New York City.

Cultural life and recreation

New York City ranks as one of the world's greatest cultural centers. It has many art galleries, drama and dance groups, musical and literary societies, and other cultural organizations. It also has some of the world's

The Theater District is near Times Square. Its many playhouses are called Broadway theaters. Some theaters feature musicals, and others specialize in comedies and serious dramas. Theatergoers line up in front of the Eugene O'Neill Theatre in this picture.

finest concert halls, museums, and theaters. Many of the nation's greatest actors, artists, musicians, poets, and writers live in New York.

There are several reasons for New York City's leading position as a cultural center. Many of the city's wealthy residents have long given financial support to cultural activities. Traditionally, the city has also offered people in the arts an atmosphere that encourages freedom of expression. In addition, New York's many advertising agencies, broadcasting and film studios, recording companies, and publishing houses have provided jobs that attract creative people.

The arts. Nearly all the arts thrive in New York City. Many new styles in American drama, literature, music, and painting have developed in New York and then spread to the rest of the country.

One of New York City's most famous and popular forms of art is the theater. Most important American plays and musical comedies have their premieres in the city's famous Theater District. The theaters in this district are called *Broadway* theaters, though few are actually on that street. Most are on side streets near Times Square. Many plays and musicals are also presented in *off-Broadway* and *off-off-Broadway* theaters in Manhattan and Brooklyn.

Musical organizations in New York City include the New York Philharmonic, one of the world's great symphony orchestras, and the Metropolitan Opera Association, an outstanding opera company. Both the orchestra and the opera company perform at the Lincoln Center for the Performing Arts. Lincoln Center also houses the New York City Ballet, the New York City Opera, and the Juilliard School of Music. The New York City Center of Music and Drama on West 55th Street offers a variety of fine arts programs. Many concerts are held at Carnegie Hall, near Central Park. The JVC Jazz Festival New York presents jazz concerts in the city for several days in late June and early July.

Thousands of artists live and work in New York City. They display and sell their paintings, sculptures, and other works of art in the city's dozens of galleries. Many artists have made roomy studios in abandoned warehouses and factories in Manhattan. Most of the buildings were abandoned by industries that moved to suburban areas.

Architecture. New York's best-known style of architecture is the towering skyscraper. The giant buildings that form Manhattan's dramatic skyline are famous throughout the world.

One of the oldest and most famous skyscrapers in New York is the Flatiron Building, on 23rd Street where Broadway crosses Fifth Avenue. The 21-story building was completed in 1903. It has a triangular shape like that of an old-fashioned flatiron.

During the 1930's, several famous skyscrapers were built in New York City. The most famous, the 102-story Empire State Building, was completed in 1931. The Empire State Building ranked as the tallest building in the world for many years. The 77-story Chrysler Building at Lexington Avenue and 42nd Street and the 70-story RCA Building in Rockefeller Center were also completed in the 1930's.

Many glass-walled skyscrapers have been built in New York since the 1950's. These buildings include the United Nations Secretariat along the East River at 44th Street, Lever House on Park Avenue between 53rd and 54th streets, and the Seagram Building on Park Avenue between 52nd and 53rd streets.

Several New York City churches are famous for their Gothic Revival style of architecture. They include the

leighborhood festivals allow New York City residents to enjoy ultural activities near their homes. The festivals are free and feaıre various types of music and other entertainment.

Episcopal Cathedral of St. John the Divine between 110th and 113th streets near Broadway, the Roman Catholic St. Patrick's Cathedral on Fifth Avenue between 50th and 51st streets, and the interdenominational Riverside Church on Riverside Drive and 122nd Street.

Other buildings of architectural interest in New York City include the many narrow brownstone houses that line side streets in Manhattan and Brooklyn. Most of these houses were built in the late 1800's as single-family homes. Today, many of them have been divided into apartments.

Libraries. New York City has three public library systems. The New York Public Library system serves Manhattan, the Bronx, and Staten Island. The Brooklyn Public Library serves Brooklyn, and the Queens Borough Public Library serves Queens. Altogether, the three systems have nearly 200 branch libraries.

The New York Public Library system has 80 of the branches—more than any other city public library in the United States. The library's Central Research Building on Fifth Avenue at 42nd Street is a Manhattan landmark.

In addition to the public library systems, New York City has more than 1,000 libraries operated by schools, colleges, and private organizations. Many of these libraries are highly specialized. For example, the Pierpont Morgan Library has rare books and manuscripts, and the Dag Hammarskjöld Library at the United Nations

specializes in books dealing with international affairs and world peace.

Nearly all museums in New York have an associated library. The most important of these libraries include the Metropolitan Museum Art Reference Library, the Frick Art Reference Library, and the Museum of Natural History Library.

Museums. New York City has many kinds of museums. The Metropolitan Museum of Art on Fifth Avenue at 82nd Street is the largest art museum in the United States. It has more than 2 million works of art. These works represent nearly every culture of the last 5,000 years. The museum occupies four city blocks, yet it has space to display only part of its huge collection at one time. The Cloisters, a branch of the Metropolitan Museum, is devoted to European art of the Middle Ages. The building is designed like a medieval monastery. The Cloisters stands in Fort Tryon Park at the northern tip of Manhattan.

Several New York City museums specialize in modern art, such as the Museum of Modern Art, located temporarily in Queens, the Whitney Museum of American Art on Madison Avenue and 75th Street, and the Guggenheim Museum on Fifth Avenue at 89th Street. The Guggenheim is in an unusual circular building designed by the famous American architect Frank Lloyd Wright. The Frick Collection on 70th Street at Fifth Avenue has a notable collection of art that dates from the 1300's through the 1800's. The museum occupies one of Manhattan's few remaining mansions.

The American Museum of Natural History stands at 79th Street and Central Park West. It has the largest amount of exhibition space of any natural history museum in the world. The American Museum's exhibits include lifelike models of animals shown in reproductions of their natural surroundings.

New York City also has several historical museums. These museums include the Museum of the City of New York on Fifth Avenue at 103rd Street.

Parks. New York has more parks, playgrounds, beaches, and other recreational areas than any other city in the United States. Many parts of New York are so crowded, however, that children must still play in the city streets.

Central Park, in the middle of Manhattan, is the best known of the city's more than 100 parks. This vast recreational site is $2\frac{1}{2}$ miles (4 kilometers) long and $\frac{1}{2}$ mile (0.8 kilometer) wide and has athletic fields, gardens, a lake, playgrounds, and wooded areas. Central Park includes the Mall, where outdoor concerts and other events are held, and the Ramble, an enclosed bird sanctuary.

The Gateway National Recreation Area forms a 26,579-acre (10,756-hectare) park. It covers shorelines and islands of Queens and Brooklyn, as well as part of the Staten Island shore.

Other large parks in New York City include Bronx and Van Cortlandt parks in the Bronx, Prospect Park in Brooklyn, and Flushing Meadow-Corona Park in Queens. In many parts of the city, small parks and playgrounds have been developed on any open land that was available, including single empty lots.

New York City has several zoos and botanical gardens. Central Park in Manhattan contains a zoo. The Bronx Zoo (officially the International Wildlife Conservation Park) in Bronx Park has one of the largest collections of animals of any zoo in the United States. Bronx Park also includes the New York Botanical Garden, which features plants from most parts of the world. In addition, Brooklyn and Queens have outstanding botanical gardens.

Sports. The city has two major league baseball teams —the New York Yankees of the American League and the New York Mets of the National League. The Yankees play in Yankee Stadium in the Bronx. The Mets play in Shea Stadium in Queens.

In addition, the city has two National Football League teams. The New York Jets of the American Conference and the New York Giants of the National Conference both play in Giants Stadium in nearby East Rutherford, New Jersey.

New York City also has two professional hockey teams—the New York Islanders and New York Rangers of the National Hockey League—and a professional basketball team—the New York Knickerbockers of the National Basketball Association. The Islanders play in the Nassau County Coliseum in Uniondale, New York. The Knickerbockers and Rangers play in New York City's Madison Square Garden.

A visitor's guide

Each year, about 17 million tourists and delegates to conventions and trade shows visit New York City. To accommodate all these visitors, New York has hundreds of hotels, motels, and rooming houses, and thousands of restaurants. Some of the city's hotels rank among the world's most luxurious. Many restaurants specialize in a certain type of cooking, such as Chinese, French, German, or Italian. In fact, no other city in the world has so many kinds of restaurants as New York.

Following are descriptions of some of New York City's many interesting places to visit. Other places of interest in the city are discussed and pictured earlier in this article.

Empire State Building on Fifth Avenue between 33rd Street and 34th Street is a 102-story New York City landmark. Public observation decks on the 86th and 102nd floors of the Empire State Building offer visitors spectacular views of the city.

Financial District is centered on Wall and Broad streets near the southern tip of Manhattan. Many banks, brokerage houses, and stock exchanges are in the district. Tours are given of the New York Stock Exchange, a the corner of Wall and Broad streets.

Greenwich Village lies south of 14th Street and west of Broadway. Many actors, artists, musicians, and other people in the arts live in the area and in the SoHo area to the south. The Village and SoHo have several small theaters and many interesting shops and art galleries.

Museum of Modern Art displays modern paintings, sculptures, films, photographs, and other works of art. It is temporarily located in Queens while its West 53rd Street site is being expanded and renovated.

Rockefeller Center on Fifth Avenue between 48th and 51st streets includes the sunken Plaza, used for outdoor dining in summer and ice skating in winter; the 70 story RCA Building, which has a public observation roo Radio City Music Hall, a 5,900-seat theater featuring films and stage shows; and the studios of the National Broadcasting Company (NBC). Tours are given of the NBC studios and of the entire center.

Rockefeller Center Plaza

St. Patrick's Cathedral is located at Fifth Avenue and 50th Street, across from Rockefeller Center. It is the seat of the Roman Catholic Archdiocese of New York. St. Patrick's Cathedral is one of the finest examples of Gothic Revival architecture in the United States. See **Saint Patrick's Cathedral.**

Statue of Liberty on Liberty Island in New York Harbor is the world-famous symbol of American freedom. Boats carry visitors to the island from Battery Park at the southern tip of Manhattan. See **Statue of Liberty.**

United Nations Headquarters lie along the East River between 42nd and 48th streets. Visitors may take tours of the Secretariat, General Assembly, and Conference buildings. A limited number of free tickets are available for meetings of the General Assembly and other United Nations organizations. See **United Nations.**

Government

New York City's government is presently organized under a charter that was adopted in 1961 and that became effective in 1963. The government of New York is more centralized than that of most other cities in the United States. In New York, the central government is responsible for public education, correctional institutions, libraries, public safety, recreational facilities, sanitation, water supply, and welfare services. In most of the

City Hall, completed in 1811, is one of New York City's architectural landmarks. The building is part of the Municipal Civic Center and is surrounded by City Hall Park and by other city government buildings. The mayor and the mayor's staff have their offices in City Hall.

other cities in the United States, however, at least some of these services are provided by separate government units.

Until mid-1990, the New York City legislature consisted of a City Council and the Board of Estimate. In 1989, however, the Supreme Court of the United States declared that the composition of the Board of Estimate was unconstitutional because smaller boroughs had as many votes as larger boroughs. In November 1989, residents of New York City approved a plan to revise their city charter, which included abolishing the Board of Estimate. This revision was approved by the United States Department of Justice in December 1989. A number of changes went into effect immediately. The Board of Estimate was eliminated in September 1990.

New York City's government is headed by a mayor and a City Council. The mayor is the chief executive of New York City. The mayor is elected to a four-year term and is responsible for the administration of city government. The heads of about 50 city departments are appointed by the mayor. The mayor also may appoint one or more deputy mayors as assistants.

The City Council consists of a council president and representatives from each of the city's 51 districts. Council members and the president are elected in citywide elections and serve four-year terms. The president presides over meetings but may vote only in the event of a tie. The council also elects one of its members to the position of council speaker and majority leader. The council may pass laws and must approve the city's budget. It also has jurisdiction over most land use issues.

New York City has five boroughs. Each borough elects a borough president to a four-year term. The borough presidents advise the mayor on issues of interest to their boroughs. They also may serve on special city committees.

New York City has an annual budget of about $29 billion. The city gets part of its income from about 20 different taxes, including an income tax, real estate tax, and sales tax. The real estate tax provides the most tax income. But the total tax income is far from enough to meet the city's expenses. The city gets additional money from the state and federal governments.

The Democratic Party has long been the most powerful political party in New York City. It has more than three times as many members as the Republican Party and usually controls between 75 and 85 percent of the city's elective offices. Neither the Democratic nor the Republican party in New York City has a strong citywide organization. Both political parties have separate organizations in each of the five boroughs.

Two minor political parties, the Liberal and the Conservative parties, also influence New York City politics. Both of these parties have affected city elections chiefly by supporting candidates from one of the two major parties.

History

The earliest people known to have lived in the New York City area were American Indians. Several tribes of the Algonquian family of Indians lived peacefully on the shores of New York Harbor and along the banks of the Hudson and East rivers. The Indians lived in small villages of bark houses. They fished, hunted, raised crops, and trapped animals. They traveled the area's waterways in sturdy canoes.

Exploration. The first European to enter New York Harbor was probably Giovanni da Verrazzano, an Italian explorer employed by the king of France. Verrazzano and his crew landed on Staten Island in 1524, while exploring the North American coast.

Other explorers visited the New York City region after Verrazzano. But none of these explorers reported seeing the island the Indians called *Man-a-hat-ta* (Island of the Hills). Finally, in 1609, Henry Hudson reached Manhattan and then sailed up the river that now bears his name.

Hudson was a citizen of England who was exploring for the Dutch, and so the Netherlands claimed the territory he had found. The region was later named New Netherland.

Settlement. In 1613, the Dutch trader and explorer Adriaen Block and his crew became the first Europeans to live on Manhattan Island. They built several huts and spent the winter near the southern tip of the island after their ship was destroyed by fire. Adriaen and his crew built a new ship and left Manhattan Island in the spring of 1614.

In 1624, the Dutch West India Company, a trading and colonizing firm, sent settlers to Manhattan. In 1625, the settlers laid out a town and built a fort called Fort Amsterdam at the island's southern tip. The next year, the governor (or director-general) of New Netherland, Peter Minuit, bought the island from the Indians for goods worth 60 Dutch guilders, the equivalent of about $24.

Soon after Fort Amsterdam was built, the entire settlement was named New Amsterdam. The colony grew slowly at first because the governors sent by the Dutch were poor administrators. But in 1647, Peter Stuyvesant became governor, and under his administration the town began to prosper rapidly.

About 1,000 people lived in New Amsterdam during the 1650's. Their houses stood along narrow dirt lanes. In 1653, the colonists built a wall along the northern edge of town because they feared attacks by Indians or by white enemies. But the wall fell down within a few years. Later, the colonists laid out a road in its place. The road became known as Wall Street.

While New Amsterdam was being established on Manhattan Island, colonists were also arriving in what is now the Bronx, Brooklyn, and Queens. Jonas Bronck, a Dutch citizen from Scandinavia, after whom the Bronx is named, became the first European settler in that area. Bronck set up a 500-acre (200-hectare) farm in 1641 and was soon followed by other settlers. Dutch and English colonists established small villages in Brooklyn and Queens. Staten Island developed more slowly than the other areas partly because settlers there often had trouble with Indians.

English rule. The Netherlands and England fought three naval wars between 1652 and 1674. In 1664, English warships sailed into New York Harbor and forced Peter Stuyvesant to surrender New Amsterdam. The Dutch regained the colony a few years later but then gave it to England under the terms of a peace treaty. The English renamed the colony New York.

New York grew quickly under English rule. By 1700, its population reached about 7,000, and buildings filled lower Manhattan. The town's first newspaper, the *New-York Gazette,* appeared in 1725. King's College, now Columbia University, was founded in 1754.

New York City played an important role in the American Colonies' fight for freedom from Britain. In 1765, the Stamp Act Congress met in New York to protest unfair taxes. In 1770, New Yorkers clashed with British soldiers, and one man was killed in the fighting. Soon after the Revolutionary War in America began in 1775, American forces took possession of the city. But the British regained New York City after the Battle of Long Island in 1776. They held the city until the Revolutionary War ended in 1783.

In January 1785, New York City became the temporary capital of the United States. The Congress of the United States met in the city until August 1790. George Washington was inaugurated in New York City as the nation's first president in April 1789.

The growing city. During the early years of the United States, Philadelphia and Boston were larger and more prosperous than New York. But New York's economy and population expanded rapidly. The city took advantage of its excellent natural harbor to increase its trade with other East Coast ports and with foreign countries. European immigrants began to pour into the city. By 1800, New York had about 60,000 people, more than any other city in the country.

New York's growth continued during the early 1800's. In 1811, city officials, planning for further expansion, decided that all newly built Manhattan streets should run in straight lines. That decision resulted in the regular pattern of cross streets north of what is now Greenwich Village.

The Erie Canal opened in upstate New York in 1825. The canal provided an important link in an all-water route between New York City and the rapidly developing Midwestern States (see **Erie Canal**). An increasing number of banks, insurance companies, and investment firms added to the city's economic growth.

New York's neighboring communities also grew quickly during the early 1800's. Brooklyn, the most im-

New Amsterdam was a Dutch settlement that became New York City. The settlers laid out the town on Manhattan Island in 1625. By the 1650's, New Amsterdam had about 1,000 residents.

portant of these communities, was incorporated as a village in 1816 with 3,300 residents. By the time it became a city in 1834, it had about 24,000 people.

During the 1800's, thousands of European immigrants arrived in New York City every year. Until about 1890, most of them came from Germany, Ireland, and other countries of northern and western Europe. After about 1890, most immigrants came from southern and eastern European countries. Many immigrants had difficulty adjusting to the city. They lived in crowded slums and had trouble finding jobs.

Politicians, especially members of the Democratic Party organization in Manhattan called Tammany Hall, offered jobs, gifts, and advice to immigrants. In return, the immigrants voted to keep Tammany Hall in power. But the politicians actually did little to solve the immigrants' most important problems, such as the need for better housing, education, and medical care. In 1871, Tammany boss William M. Tweed and some of his followers were arrested and charged with cheating the city out of several million dollars. The Tweed Ring, as his group was called, was driven from public life. But the Tammany organization soon regained power. See **Tammany, Society of.**

Formation of Greater New York. In 1883, engineers completed the Brooklyn Bridge, which provided the first direct link between Manhattan and Brooklyn. In 1898, Brooklyn and several communities in what became the Bronx, Queens, and Staten Island were united with Manhattan to form what was called Greater New York. The sprawling new city had more than 3 million residents. Nearly 2 million of the people lived in Manhattan. However, during the early 1900's, subways and bridges were constructed to provide convenient transportation between Manhattan and the other boroughs. The city's people then began to spread out. As the populations of the other boroughs grew, the population of Manhattan decreased.

But Manhattan remained the largest and most powerful borough of Greater New York, and so its Tammany Hall organization continued to control city politics. Occasionally, voters became angered enough by the illegal activities of Tammany leaders to elect mayors who promised reform. But none of these reform mayors lasted more than one term—until Fiorello La Guardia became mayor in 1934. La Guardia, an honest and outspoken reformer, served from 1934 to 1945. Since his administration, no political organization has been able to control New York politics.

Recent developments. Since the 1940's, New York City, like other communities, has been troubled by many problems. The severity of the problems began increasing during the early 1960's. Air and water pollution harmed New York City's environment. Highways and mass transportation systems become overcrowded and outdated. Housing shortages increased. Racial conflict worsened.

New York City has also faced a series of damaging strikes by public employees. In 1966, transit workers struck for 12 days, halting all subway and bus service. In 1968, striking sanitation workers let garbage pile up on city streets for 9 days. In 1971, police officers refused to go on patrols for 6 days. These and other strikes involved disputes over such matters as wages, benefits, and working conditions.

New York City experienced a financial crisis in 1975, when the city's government lacked enough money to pay all its bills for the year. The New York state legislature helped ease the situation by establishing the Municipal Assistance Corporation, which lent the city some money. The federal government also provided funds for the city. To help pay its expenses during the late 1970's,

Harper's Weekly, The Newberry Library, Chicago

Tammany Hall, a powerful Manhattan political organization, was often attacked by cartoonist Thomas Nast. This cartoon appeared in 1871, after its leaders were caught cheating the city out of money.

Museum of the City of New York

Thousands of immigrants arrived in New York City every year during the 1800's. Before entering the city, many immigrants had to pass through the immigration station on Ellis Island. The island is now part of the Statue of Liberty National Monument.

Brown Brothers

Times Square in the 1930's was as much the heart of New York City's Theater District as it is today. Much of the area has been redeveloped, but it remains the center of the Theater District.

Russell Reif, Pictorial Parade

A financial crisis hit New York City in 1975 and caused great concern for the city's future. A rally in Times Square, *shown here,* supported the use of federal aid to help the city.

New York City increased city taxes, eliminated thousands of city government jobs, and reduced city services. In the 1980's, the city's economic situation improved.

In 1989, the Supreme Court of the United States declared the Board of Estimate of New York City unconstitutional. See the *Government* section of this article for details.

In February 1993, a powerful bomb exploded in a parking garage of the World Trade Center. The blast killed 6 people and injured more than 1,000. It caused more than $300 million in damage to the Trade Center. Four men, including Sheik Omar Abdel Rahman, an Egyptian Muslim cleric, were convicted of the bombing and sent to prison.

A time of change. Democrat Edward I. Koch was elected mayor of New York City in 1977. In 1981, he became the first person ever nominated mayor by both the Democratic and Republican parties. David N. Dinkins, a Democrat and an African American, served as mayor of New York City from 1990 to 1994. He was the city's first African American mayor. Republican Rudolph W. Giuliani was elected mayor in 1993. He was the first Republican to be chosen mayor since 1965. He served until the end of 2001.

A rise in the city's spirit took place about the same time Giuliani became mayor. About a million new immigrants and a booming New York-based stock market helped to invigorate the city's economy. New York City's crime rate dropped, and real estate prices soared. Neighborhood environmental efforts helped clean the city's air and the Hudson River.

On Sept. 11, 2001, terrorists in hijacked commercial airplanes crashed the planes into the twin 110-story towers of the World Trade Center. In related incidents that day, a hijacked plane crashed into the Pentagon Building, just outside Washington, D.C., and another hijacked

AP/Wide World

New York Public Library is one of the most extensive public library systems in the United States. It was founded in 1895. The library operates four research centers that depend heavily on private contributions: the Humanities, Social Sciences and Special Collections; the Schomburg Center for Research in Black Culture; the New York Public Library for the Performing Arts; and the Science, Industry and Business Library Center. Public funds from New York City support a system of 82 branch libraries in the boroughs of Manhattan, the Bronx, and Staten Island. The library's landmark Central Research Library, located at Fifth Avenue and 42nd Street, was designed in 1904 by American architects Thomas Hastings and John M. Carrère. The city has two other public li-

brary systems, the Brooklyn Public Library and the Queens Borough Public Library.

The research libraries collectively contain about 36 million items, including books, manuscripts, pictures, maps, and reels of film and microfilm. The branch libraries have approximately 10 million items, including about 300,000 books in braille and on cassette tape.

New York State. See New York.

New York State Barge Canal System connects the state's principal natural waterways. The toll-free canal system and its connecting waterways extend 800 miles (1,300 kilometers) from Lake Champlain and the Hudson River to Lake Erie and Lake Ontario. The canal system proper is 524 miles (843 kilometers) long.

The system consists of four canals—the Erie, the Champlain, the Oswego, and the Cayuga and Seneca. The 348-mile (560-kilometer) Erie Canal connects Tonawanda on the Niagara River with Troy and Albany on the Hudson River. The Champlain Canal, between Whitehall on Lake Champlain and Waterford near Troy, is 60 miles (97 kilometers) long. The 24-mile (39-kilometer) Oswego Canal links Oswego on Lake Ontario and Three Rivers on the Erie Canal. The Cayuga and Seneca Canal includes passages through Cayuga and Seneca lakes. It extends 92 miles (148 kilometers) from the Erie Canal through Montezuma Swamp and southward to Ithaca, Watkins Glen, and Montour Falls.

The New York State Legislature authorized construction of the canal system in 1903. It did so under strong pressure from merchants and other business people who did not want the railroads to have total control of transportation across the state. The system was opened in 1918. It has 57 locks, each 300 feet (91 meters) long and $43\frac{1}{2}$ feet (13.3 meters) wide. It has a channel depth of 14 feet (4.3 meters) from Waterford to Oswego and 12 feet (3.7 meters) on all its other canals.

The locks can handle barges carrying over 3,500 tons (3,180 metric tons) of cargo. A vessel can pass through a lock in 20 minutes. About 210,000 tons (190,000 metric tons) of cargo and thousands of pleasure boats move through the system each year. Since the mid-1900's, the use of the system for the shipping of cargo has decreased greatly. At the same time, its use for pleasure boats has increased sharply. Michael K. Heiman

New York Stock Exchange is the oldest and largest stock exchange in the United States. Brokers on the exchange buy and sell shares of stock in most of the largest U.S. corporations. They also trade stock in many firms headquartered outside the United States. Prices are set largely by supply and demand on a central trading floor. The New York Stock Exchange stands at the corner of Broad and Wall streets in New York City.

The New York Stock Exchange, often called the NYSE, sets standards for those who want to trade there. Brokers must pass a written examination. They also must register with the Securities and Exchange Commission (SEC). The SEC is a U.S. government agency that administers and enforces federal laws governing the purchase and sale of stocks and bonds.

The New York Stock Exchange traces its roots to 1792, when a group of New York City stock dealers and traders agreed to funnel business to one another. They called their arrangement the Buttonwood Agreement, after the buttonwood tree under which they met. New York City brokers established a formal organization, the New York Stock and Exchange Board, in 1817. In 1863, the group changed its name to the New York Stock Exchange. New York University, in New York City, is a privately endowed nonsectarian coeducational institution. It is the largest privately supported university in the United States. The university offers over 2,500 courses of study in many fields. It employs over 5,000 faculty members.

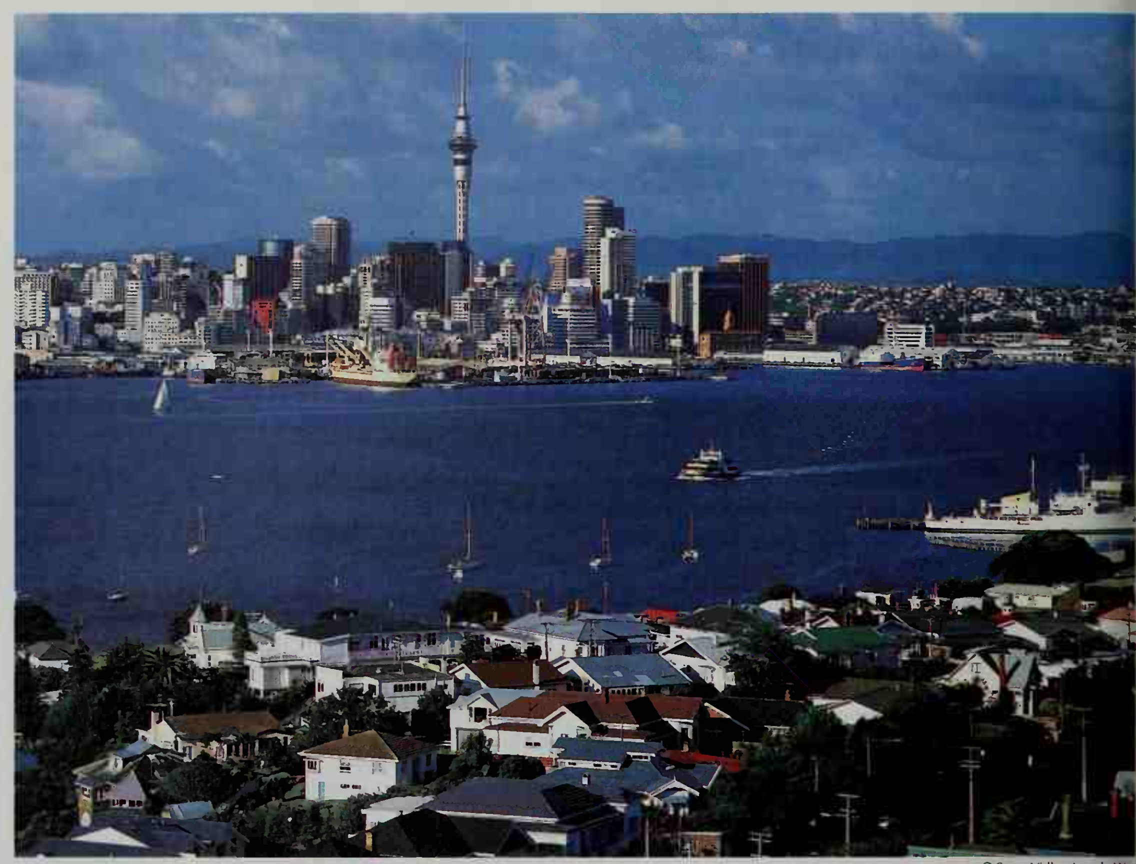
Ten major divisions of the university are located around Washington Square Park: the College of Arts and Science; the Stern School of Business undergraduate division; the School of Continuing Education; Tisch School of the Arts; the School of Education, Health, Nursing, and Arts Professions; the School of Social Work; the Gallatin Division, which lets students design their own courses of study; the Graduate School of Arts and Science; the graduate division of the Stern School of Business; the Wagner Graduate School of Public Service; and the School of Law.



The New York University Medical Center has a program of medical education, research, and patient care. The College of Dentistry offers instruction and conducts dental research as well as several clinics. The Institute of Fine Arts specializes in the history of art, archaeology, conservation, and the technology of works of art. The Courant Institute of Mathematical Sciences is an international center for research and teaching in such areas as mathematics, applied mathematics, and computer science. The university was founded in 1831.

Downtown Auckland lies on the North Island on a strip of land between two harbors. Auckland is New Zealand's largest city. Its tallest landmark is the 1,076-foot (328-meter) Sky Tower, *center.*

New Zealand

New Zealand is an island country in the southwest Pacific Ocean. It lies about 1,000 miles (1,600 kilometers) southeast of Australia. New Zealand consists of two main islands—the North Island and the South Island—and a number of smaller islands. The country belongs to a large island group called Polynesia. Wellington is the capital of New Zealand, and Auckland is the largest city.

New Zealand was first settled by Polynesians from the eastern Pacific whose descendants are called the Maori. Many scholars think these Polynesians probably arrived about 1,000 years ago. British immigrants began settling in New Zealand during the early 1800's, and the country became part of the British Empire in 1840. Today, it is an independent member of the Commonwealth of Nations, an association of countries that replaced the empire.

New Zealand's current population represents many cultures. They include the Maori and other Polynesian groups; descendants of English, Irish, and other western European colonial settlers; and more recent immigrants from Asia, Africa, and eastern Europe.

Giselle M. Byrnes, the contributor of this article, is Lecturer in New Zealand History at Victoria University of Wellington.

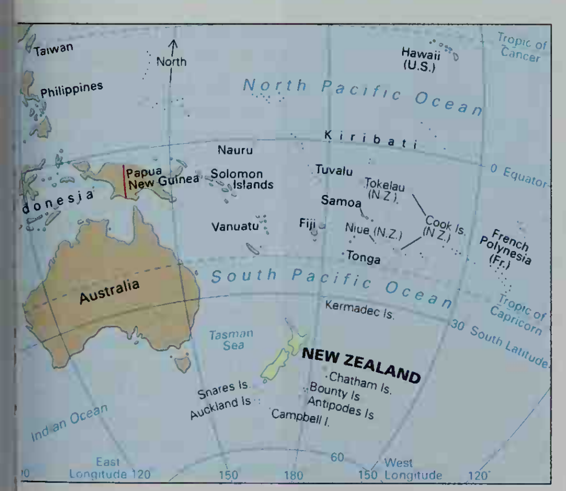
New Zealand is a beautiful country of snow-capped mountains, green lowlands, beaches, and many lakes and waterfalls. No place is more than 80 miles (130 kilometers) from the coast, and most places have striking views of mountains or hills.

Government

New Zealand is a constitutional monarchy. Queen Elizabeth II of the United Kingdom is also Queen of New Zealand. She appoints a governor general, recommended by New Zealand's prime minister, to represent her. The governor general's main function is to arrange for the leader of the political party with the most support in Parliament to form a government. The governor general's consent is required before bills can become law, but this requirement is normally a formality. The legislature, prime minister, and Cabinet run the government.

The constitution. New Zealand has no formal written constitution. The country's unwritten constitution is a combination of *precedent* (tradition) and written material closely modeled on the constitutional practices of the United Kingdom. Written parts of New Zealand's constitution include Magna Carta, a 1215 document that put the king of England under the rule of law, and the

Facts in brief



Capital: Wellington.
Official languages: English and Maori.
Area: 104,454 mi² (270,534 km²). *North Island*—44,701 mi² (115,777 km²); *South Island*—58,385 mi² (151,215 km²); *Stewart Island*—674 mi² (1,746 km²); *Chatham Islands*—372 mi² (963 km²); other islands—322 mi² (837 km²). *Coastline*—about 3,200 mi (5,150 km).
Elevation: *Highest*—Mount Cook, 12,316 ft (3,754 m) above sea level. *Lowest*—sea level along the coast.
Population: *Estimated 2002 population*—3,930,000; population density, 38 per mi² (15 per km²); distribution, 85 percent urban, 15 percent rural. *1996 census*—3,618,303.
Chief products: *Agriculture*—apples, barley, beef, dairy products, hides, kiwi fruit, lamb, mutton, potatoes, wheat, wool. *Fishing industry*—blue grenadier (hoki). *Forestry*—Monterey pine. *Manufacturing*—beer, clothing, food products, footwear, machinery, paper, textiles, wood products. *Mining*—coal, gold, ironsand, limestone.
Anthems: "God Defend New Zealand" (national); "God Save the Queen" (royal).
Money: *Basic unit*—New Zealand dollar. One hundred cents equal one dollar.

New Zealand's flag, officially adopted in 1902, features the British Union Flag and four stars of the constellation Southern Cross against a royal blue background.

Coat of arms. Symbols on the shield represent the value of farming, mining, and trade to New Zealand. The crown represents the British monarch, who is also the monarch of New Zealand.

ew Zealand, a country in the Pacific Ocean, lies about 1,000 iles (1,600 kilometers) southeast of Australia. New Zealand con-its of the North Island, the South Island, and smaller islands.

Habeas Corpus Act of 1679, which protects people from being imprisoned unjustly.

The legislature. New Zealand's Parliament consists of the monarch, represented by the governor general, and an elected House of Representatives, also called the Parliament. The House of Representatives has 120 members. Voters directly elect 69 of these members. Seven of the directly elected seats are reserved for the Maori, though additional Maori candidates can be elected. The rest of the House is chosen on the basis of *proportional representation.* Under this method, each political party that receives at least 5 percent of the popular vote gets a number of seats determined by the percentage of the vote it receives. A parliamentary election must be held every three years, but may be held sooner. All citizens 18 years of age or older can vote in a general election.

The prime minister and Cabinet. The leader of the political party that wins the most seats in a parliamentary election becomes prime minister. The leading party may also form a coalition government with other parties if it does not gain a majority in Parliament.

On the advice of the prime minister, the governor general appoints the Cabinet to run the various government departments. The Cabinet members, called *ministers,* are members of Parliament. The prime minister and the Cabinet are called the *Government.* The Government proposes most new legislation in Parliament. If Parliament votes in favor of the bill, it becomes law.

Political parties. There are about 30 registered political parties in New Zealand. The largest are the National Party and the Labour Party. There is no clear division between the policies of either party. Traditionally, the Labour Party has favored government control and public regulation of industry, whereas the National Party has favored free enterprise. Since 1984, however, both parties have adopted similar economic policies.

Local government. New Zealand has a *unitary* system of government, in which Parliament has the power to create and authorize local governments. The country has 12 regions, each with a regional council. Local government is further divided into territorial authorities, community boards, and special purpose authorities. The territorial authorities consist of city councils, district councils, and the council for the Chatham Islands.

Ombudsman is an official selected by Parliament to investigate complaints by citizens against government departments and related organizations. If an ombudsman believes a complaint is justified, he or she reports it to the department concerned along with any recommendation for action.

Courts. New Zealand's highest court is the Court of Appeal, which hears mainly cases that have been appealed from a lower court. Some decisions of the Court of Appeal, such as those involving large amounts of money, may be appealed to the Privy Council in the United Kingdom. The Privy Council is an honorary panel of advisers to the monarch (see **Privy Council**).

Below the Court of Appeal in New Zealand are the High Court and district courts. The High Court deals with major crimes, important civil claims, and appeals from lower courts. It also reviews administrative actions. District courts serve specific regions. Justices of the peace and community magistrates hear traffic and minor criminal charges. A number of courts also have special

functions, such as the employment court, family court, youth court, environment court, and Maori Land Court.

Armed forces of New Zealand are called the New Zealand Defence Force (NZDF). The NZDF consists of a navy, army, and air force, together with civilian employees. Military service is voluntary.

Overseas territories. New Zealand governs two overseas territories. They are Ross Dependency, a part of Antarctica; and Tokelau, an island group northeast of New Zealand. New Zealand formerly governed the Cook Islands and the island of Niue. The Cook Islands became self-governing in 1965 and Niue in 1974. But the people of these islands are still considered citizens of New Zealand, and the country still has some responsibility for the islands' defense and foreign affairs.

People

New Zealand has two main ethnic groups, the Maori and whites of European ancestry. The Maori make up about 15 percent of the population and form the country's largest minority group. More than 80 percent of the people are New Zealanders of European ancestry. The number of New Zealanders of other Pacific Island or Asian ancestry is growing. People of non-Maori ancestry are known as *Pakeha* (pronounced *PAH kee hah*). Many Pakeha are descended from British colonists who came to the country during the 1800's, and so many New Zealand customs resemble British customs. However, New Zealand has developed its own sense of identity as a country of both British and Polynesian heritage.

New Zealand has two official languages, English and Maori, though English is the most widely used. Other languages spoken include Cook Island Maori, Dutch, Greek, Italian, Niuean, Samoan, and Tongan.

Way of life

City life. New Zealand's cities offer a wide range of economic and social opportunities. City dwellers can work in New Zealand's business, communication, manufacturing, and shipping industries. Urban New Zealanders enjoy easy access to the fine arts, education, entertainment, and night life. New Zealand's cities are fairly uncrowded. Some city dwellers live in high-rise apartment buildings, but most own their own homes.

Rural life in New Zealand centers mainly around agricultural activities such as raising sheep and cattle and growing fruits, vegetables, and grain. Many people in the northern part of New Zealand's North Island raise dairy cattle. In other parts of North Island and on South Island, beef cattle and sheep are more common. Farmers produce large amounts of apples, kiwi fruit, and other fruits. Vineyards in the southern regions of North Island, the northern regions of South Island, and the eastern regions of both islands grow grapes and produce New Zealand wine.

Food and drink. New Zealand's cooking combines British traditions with foods grown in the country. Traditionally, New Zealanders have favored beef, mutton, and venison served as steaks, as sausages, or in meat pies. But vegetarianism is increasing in popularity. New Zealand's coastal waters offer an abundance of seafood. Dairy products such as milk, cheese, and ice cream are important foods. A favorite dish is a sweet meringue dessert called *pavlova*. Tea, coffee, beer, and wine are popular beverages.

Recreation. Sports and outdoor activities are important forms of recreation in New Zealand. New Zealanders enjoy Rugby Union, a form of rugby football generally regarded as the national sport. New Zealand's national Rugby Union football team is called the All Blacks. Cricket is another popular spectator sport. In the summer, New Zealand's mountainous terrain offers mountaineering, hiking, and climbing. In the winter, skiing and other snow sports are popular. New Zealand's

AP/Wide World

Rugby Union football is widely popular in New Zealand and is regarded as the national sport. The country's national Rugby Union team is the All Blacks, shown here in black uniforms.

coastal waters attract many boaters and surfers. Horse racing has always been a favored leisure activity.

Fishing and hunting are popular pastimes. Rainbow trout and brown trout abound in New Zealand's lakes and rivers. The North Island's warm coastal waters provide excellent line fishing and spear fishing. Boating offers the additional attraction of deep-sea fishing for marlin, shark, or tuna. The chief game birds for hunters are duck, swan, pheasant, quail, and geese.

Religion. The Anglican Church is the largest religious group in New Zealand. About 18 percent of the people are Anglicans. About 14 percent are Roman Catholics, and about 13 percent are Presbyterians. New Zealand society has become more *secular* (nonreligious), and a growing number of people have no religious affiliation.

Education. New Zealand has public schools funded by the state and private schools, most of which are church sponsored. All children from the ages of 6 to 16 must attend school, though most children begin at the age of 5. Students who live in isolated areas or who have special physical or psychological needs may receive instruction from The Correspondence School in Wellington. The school also serves adults and pupils who wish to study courses not offered at their local schools.

The country has eight universities. They are Massey University in Palmerstown North; Victoria University of Wellington; Lincoln University, near Christchurch; the University of Auckland; Auckland University of Technology; the University of Canterbury in Christchurch; the University of Otago in Dunedin; and the University of Waikato in Hamilton. A number of technical and professional institutions also offer degrees. Three institutions known as *wananga* provide technical and university-level programs for Maori students, with an emphasis on Maori culture and language.

Almost all of New Zealand's adult population can read and write. For the country's literacy rate, see **Literacy** (table: Literacy rates for selected countries).

The arts. New Zealand literature first gained widespread attention in the early and middle 1900's. Katherine Mansfield wrote sensitive short stories about her childhood in New Zealand. Sylvia Ashton-Warner is known for her fiction and autobiographical books that draw upon her experiences as a teacher in rural New Zealand. Keri Hulme won fame for her fiction and poetry that deal with the language and culture of the Maori. Other important New Zealand writers include James K. Baxter, Janet Frame, Ngaio Marsh, and Frank Sargeson.

Important New Zealand painters include Colin McCahon, Rita Angus, and Toss Woollaston. All three were leaders in introducing modern styles to New Zealand art in the 1900's. McCahon painted intense landscapes and religious scenes. Angus created vivid portraits and landscapes in both oil and water color. Woollaston painted landscapes as well as portraits of family and friends. The Maori have maintained a long tradition of folk art, especially carefully detailed woodcarvings and intricate, swirling tattoos. Modern Maori artists have incorporated traditional Maori styles into painting and sculpture.

In music, opera singer Kiri Te Kanawa won international acclaim as one of the finest sopranos of the later 1900's. The New Zealand Symphony Orchestra is internationally recognized. The Royal New Zealand Ballet, established in 1953, is the oldest professional dance company in the country. The New Zealand School of Dance and Te Kura Toi Whakaari o Aotearoa: New Zealand Drama School offer courses in the performing arts. There are many local theater and music groups.

New Zealand has many public museums and art galleries. New Zealand's national museum—Te Papa Tongarewa, Museum of New Zealand—opened in Wellington in 1998. The New Zealand Film Archive collects and preserves a national collection of New Zealand's motion-picture history. The New Zealand Historic Places Trust preserves archaeological sites, historic areas and buildings, and sites of special significance to the Maori.

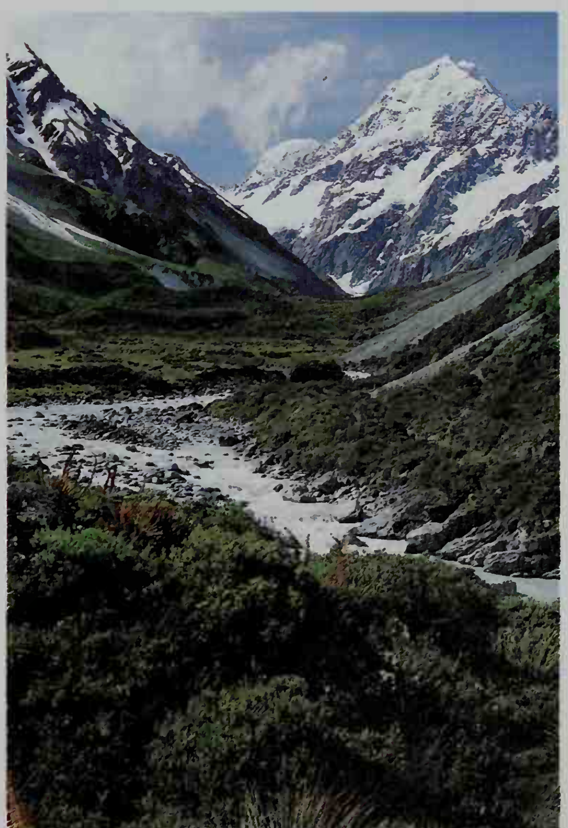
The land

New Zealand lies in the southwest Pacific Ocean. The North Island and the South Island are New Zealand's largest islands. They extend in a curve more than 1,000 miles (1,600 kilometers) long and cover about 99 percent of the country's total area. Cook Strait, which is about 16 miles (26 kilometers) wide at its narrowest point, separates the islands.

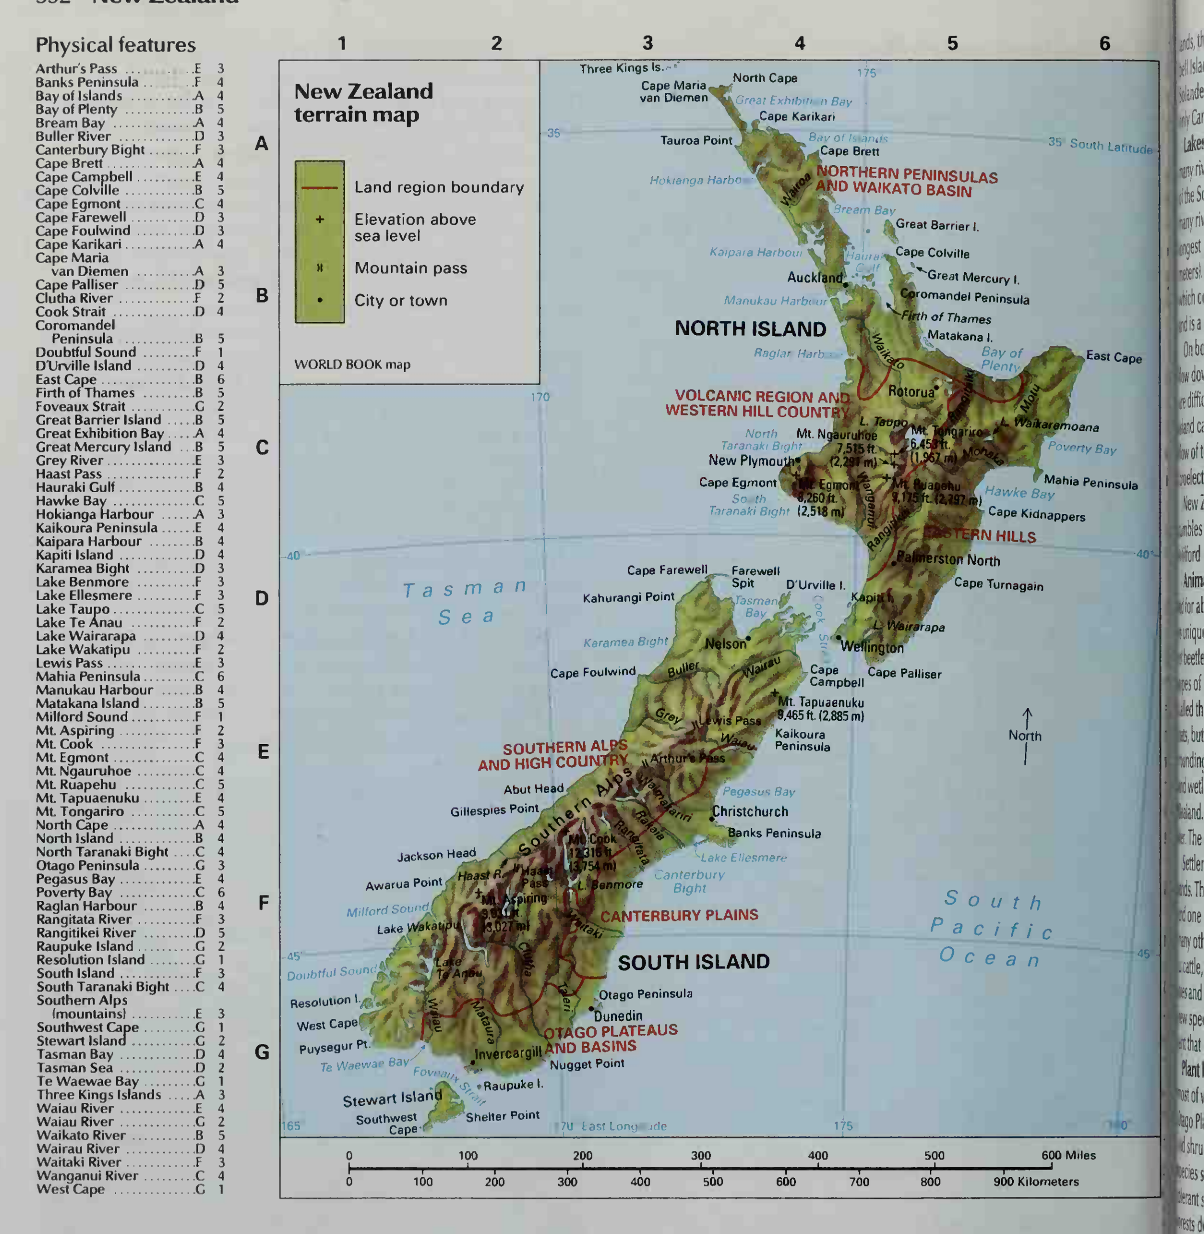
The North Island can be divided into three main land regions: (1) the Northern Peninsulas and Waikato Basin, (2) the Volcanic Region and Western Hill Country, and (3) the Eastern Hills.

The Northern Peninsulas and Waikato Basin occupy most of the northern part of the island. This region has forests, rich lowlands, and undeveloped hill country. In the lower lands, many farmers grow citrus or kiwi fruits or raise dairy cattle. Beef cattle and sheep are raised in the hill country. Long, sandy beaches line the west coast, and many inlets mark the east coast.



The Volcanic Region and Western Hill Country cover the western half of the island south of the Northern Peninsulas and Waikato Basin. Much of the region consists of volcanic rock. A large plateau covered with soft, yellow-brown soil made up of crushed *pumice*—the porous stone thrown off by volcanoes—rises along the eastern part of the region in the center of the island.

This region has several active volcanoes, including Mount Tongariro, and the highest peak on the island, 9,175-foot (2,797-meter) Mount Ruapehu. This region also has many hot springs and geysers.



The Eastern Hills occupy the eastern and southern parts of North Island. A mountain system runs through the region from East Cape to Cook Strait. The eastern slopes consist mainly of rugged hills. Ranchers use this land for grazing sheep and beef cattle. Lowlands along the east coast are used for growing vegetables and fruits. To the west of the mountains are lowlands and plains. Farmers raise dairy cattle, other livestock, and crops in this region.

The South Island has three main regions: (1) the Southern Alps and High Country, (2) the Canterbury Plains, and (3) the Otago Plateaus and Basins.

The Southern Alps and High Country cover most of the island. The highest peak in New Zealand, 12,316-foot (3,754-meter) Mount Cook, rises in the Southern Alps. The Maori name for Mount Cook is *Aoraki,* also spelled *Aorangi,* which is usually translated as *cloud piercer.*

Majestic Mount Cook, New Zealand's highest mountain, soars 12,316 feet (3,754 meters) on the South Island. Mount Cook and hundreds of other peaks attract many mountain climbers.

The Mount Cook region has some of New Zealand's most spectacular scenery. Glaciers lie on mountain slopes high above thick, green forests. Sparkling lakes nestle in valleys throughout the regions.

The western slopes of the Southern Alps and High Country region are forested, rainy, and rugged. The eastern slopes are lower and much less rainy. Along the southwest coast, long inlets of the sea called *fiords* cut into the land, creating a jagged coastline. Forested mountains border many of the fiords.

The Canterbury Plains lie along the east-central coast of the South Island. They form New Zealand's largest area of flat or nearly flat land and make up the chief grain-growing region. The plains are laid out in a patchwork of fields on which farmers grow barley, fodder crops, oats, and wheat. The plains are also an important region for raising sheep.

The Otago Plateaus and Basins lie in the southeast corner of the South Island. The region has plains and rolling hills, where crops and livestock are raised.

Other islands. Stewart Island lies about 20 miles (32 kilometers) south of the South Island. Scrubby bushes cover most of the island. Most of the people earn their living by fishing and oyster gathering. The Chatham Islands lie about 530 miles (850 kilometers) east of the South Island. Most Chatham Islanders are Maori. Fishing and sheep farming are their main occupations.

Other islands and island groups are the Antipodes Is-

lands, the Auckland Islands, the Bounty Islands, Campbell Island, the Kermadec Islands, the Snares Islands, Solander Island, and the Three Kings Islands. Of these, only Campbell Island has a permanent population.

Lakes, rivers, and waterfalls. New Zealand has many rivers, lakes, and waterfalls. In the alpine regions of the South Island, mountain snows and glaciers feed many rivers. The North Island has New Zealand's longest river, the Waikato, flowing 264 miles (425 kilometers). The island also has the largest lake, Lake Taupo, which covers 234 square miles (606 square kilometers) and is a vacation area famous for trout fishing.

On both islands, the rivers rise in the mountains and flow down to the sea. Most of the rivers flow swiftly and are difficult to navigate. The Clutha River on the South Island carries the largest volume of water. The rapid flow of the rivers makes them important sources of hydroelectric power.

New Zealand has many waterfalls. Sutherland Falls tumbles 1,904 feet (580 meters) down a mountain near Milford Sound on the South Island.

Animal life. The islands of New Zealand were isolated for about 80 million years. As a result, the animal life is unique but limited in variety. There are many species of beetles, flies, and moths. The islands have several types of frogs, geckos, and skinks, and an ancient reptile called the tuatara. The only native land mammals are bats, but dolphins, seals, and whales live in the surrounding ocean. There are also many species of coastal and wetland birds. The flightless kiwi lives only in New Zealand. *Kiwi* has become a nickname for a New Zealander. The kea is a parrot noted for its playfulness.

Settlers introduced many animal species from other lands. The ancestors of the Maori introduced the dog and one type of rat to the islands. Europeans brought many other animals, including deer and rabbits, as well as cattle, pigs, and sheep. Small kangaroos called *wallabies* and brush-tailed possums came from Australia. The new species have depleted the native species to the extent that many are now severely endangered.

Plant life. About 7,000 years ago, rain forests covered most of what is now New Zealand. In the relatively dry Otago Plains in the south of the South Island, grasses and shrubs flourished. As the climate cooled, plant species sensitive to frost diminished, while more cold-tolerant species thrived, especially in upland areas. Low forests developed on the South Island. On the North Island, broadleaf and cone-bearing trees, such as the kauri, became more widespread. Beech forests grow on the cooler uplands of both islands. Since 1900, people have introduced many foreign trees into New Zealand.

Earthquakes. New Zealand has about 100 earthquakes every year that are strong enough to be felt. The country's most disastrous earthquake occurred near Hawke Bay in 1931. It killed 256 people and badly damaged the cities of Hastings and Napier.

Climate

The country has a mild, moist climate. New Zealand lies south of the equator, so its seasons are opposite those of the Northern Hemisphere. July is New Zealand's coldest month, and January and February are the warmest months. The country's mild climate results from ocean breezes that bring warmth in winter and cool temperatures in summer. Average summer temperatures range from about 59 °F (15 °C) to about 69 °F (20 °C), but summer temperatures occasionally rise above 90 °F (32 °C). Average winter temperatures range from about 35 °F (2 °C) to about 53 °F (12 °C).

Climate regions. On the North Island, the northern tip of the Northland Peninsula is warm and humid all year. The island's central plateau has hot, sunny weather in summer and sharp frosts with occasional snow in winter. Wellington lies exposed to the frequent gales of Cook Strait. On the South Island, the rainy west contrasts with the drier east. Southern New Zealand is cooler than northern New Zealand.

Rainfall. The mountains chiefly control the distribution of rainfall in New Zealand. Winds from the west carry moisture from the ocean. This moisture falls as rain on the western slopes of the mountain ranges. Almost the entire west coast of the South Island averages more than 80 inches (200 centimeters) of rain a year. Milford Sound, on the South Island, averages about 260 inches (660 centimeters) of rain each year. East of the mountains, the winds lose most of their moisture. Some eastern regions in the country average less than 20 inches (51 centimeters) of rain a year. Snow seldom falls in lowland areas, though some mountain peaks remain snowcapped all year.

Economy

For many years, New Zealand's economy depended on agriculture. Agriculture remains important, but changing domestic and international conditions have caused a shift in economic activity. Today, the main economic sector is service industries, which employ about 65 percent of the labor force. Service industries include retail trade, restaurants and hotels, finance, transportation, and community and social services. Nearly 25 percent of the labor force work in industry and construction, and about 10 percent work in agriculture.

Manufacturing. New Zealand's factories manufacture food, wine and beer, machinery, textiles, wood products, clothing, and footwear. These industries tend to be based in the larger commercial centers, especially Auckland. Since the mid-1900's, manufactured products have become an important export.

Agriculture. New Zealand's agriculture has centered on raising sheep and cattle to produce mutton, lamb, beef, wool, dairy products, and hides. Meat products are a profitable agricultural export. New Zealand is the world's largest producer of *crossbred wool*, a coarse type of wool from a sheep that is a cross of two breeds. Crossbred wool is used mainly in interior textiles, such as carpets, upholstery, bedding, and rugs. The major crops are apples, barley, kiwi fruit, potatoes, and wheat.

Mining. New Zealand contains a wide variety of minerals. The country is probably best known for its gold, but the mining industry also produces *ironsand* (sand containing iron ore), coal, limestone, and other mineral products.

Forestry. New Zealand's *indigenous* (native) forests grow mainly in the mountain regions, particularly on the west coast of the South Island. Less than 2 percent of New Zealand's total forest production is harvested from indigenous forests. More than 99 percent of the timber comes from planted forests, mostly the fast-growing

Monterey pine. The logs are manufactured into plywood, wood pulp, veneer, and other wood products.

Fishing industry. New Zealand's exclusive economic fishing zone is one of the largest in the world, an area 15 times larger than the country's land mass. More than 1,000 species of marine fish live in these waters. About 10 percent of them have commercial value. Valuable commercial fish include blue grenadier (also called hoki), jack mackerels, snoek (also called barracouta), southern blue whiting, squid, orange roughy, and tuna.

Energy. New Zealand is self-sufficient in all forms of energy except oil. Water power provides about two-thirds of the nation's electric power. Underground steam in the North Island's volcanic area has become an increasingly important source of power. The country also produces a considerable quantity of natural gas.

International trade. New Zealand's biggest export and import partners are Australia, Japan, and the United States. The country also conducts trade with China, Germany, South Korea, Taiwan, and the United Kingdom. New Zealand's leading export is milk powder. Other important exports are aluminum, butter and cheese, fish, fruit and nuts, iron and steel, leather, machinery, meat, mineral fuels, paper, textiles, wood and wood products, and wool. The major imports include machinery, petroleum, plastics, textiles and textile articles, and vehicles.

Transportation. New Zealand has about 57,000 miles (92,000 kilometers) of streets and roads and about 3 million motor vehicles. The country also has an extensive rail system to carry both passengers and freight.

New Zealand has one of the highest ratios of aircraft to population in the world. Air New Zealand is the major domestic airline. New Zealand's largest international airports are in Auckland, Christchurch, and Wellington. While international air links have helped overcome the country's geographical isolation, New Zealand still relies heavily on sea transport for overseas trade. Auckland, the nation's chief seaport, overlooks a fine natural harbor in the northern part of the North Island.

Communication is one of the most rapidly growing sectors of the New Zealand economy. Television New Zealand operates two television channels, and offshore owners operate two others. There are also a number of local television broadcasters. Sky Television, a pay TV network, broadcasts to subscribers. Radio New Zealand Limited operates a radio network. Special broadcasts promote the Maori language and culture. New Zealand also has privately owned radio stations.

New Zealand has about 30 daily newspapers. The majority of the country's daily papers are owned by Independent Newspapers Limited and Wilson and Horton Limited. These two groups account for almost 90 percent of the country's daily newspaper circulation.

History

New Zealand's first settlers, the people who became known as the Maori, migrated from the islands of eastern Polynesia. They survived by fishing, hunting, and eventually farming. These people probably had established settlements along the coast by the A.D. 1000's. The Maori did not see themselves as one nation. Instead, they considered themselves members of their *hapu* (sub-tribe) and *iwi* (tribe). These groups jealously defended their territories. Wars among them were common.

Early European contact. In 1642, the Dutch explorer Abel Janszoon Tasman became the first European to sight New Zealand. The Maori attacked his boats, and Tasman left without going ashore. In 1769, the British explorer James Cook landed on New Zealand and claimed it for Britain (now the United Kingdom). Although Cook was cautious, he and his crew also had several violent clashes with Maori groups.

In the 1790's and early 1800's, the seals and whales in New Zealand's coastal waters attracted many American, Australian, and European hunters. Traders also came to buy flax and kauri timber from the Maori. Christian missionary groups targeted the Maori as possible converts. By the 1830's, these groups had begun to settle New

Sheep are raised in many parts of New Zealand. These animals provide mutton, lamb, and wool. Many sheep are sold at auctions. New Zealand ranks as one of the world's most important sheep-producing countries.

Zealand. These settlers heavily relied on Maori tribes.

Before 1840, no legal government had authority over the settlers and traders who came to New Zealand. Warfare between Maori groups and disputes between missionary and trading settlements were common. In 1835, a group of Maori leaders called the Confederation of Chiefs of the United Tribes of New Zealand signed a declaration proclaiming the country's independence. The declaration requested the British monarch to act as the country's protector.

European colonization. Reports of lawless conditions and fear of competition from French and American settlers led the United Kingdom to declare New Zealand a colony. In 1840, the British negotiated the Treaty of Waitangi with the Maori. About 500 Maori chiefs eventually signed the treaty.

The Treaty of Waitangi was written in English and then translated into Maori. Problems with the translation of some important words have led to disputes over which rights the Maori kept and which they signed away. For example, in English the treaty proposed that the Maori hand over their sovereignty—that is, their right to rule themselves—in exchange for recognition of their ownership of the land and the right to be protected as British subjects. But in the Maori translation, the words used for *sovereignty* and *ownership* could be understood as giving the British limited powers to govern, rather than full sovereignty.

In the United Kingdom, the British colonial organizer Edward Gibbon Wakefield created the New Zealand Company. The company established settlements at Wellington and Wanganui in 1840, New Plymouth in 1841, and Nelson in 1842. Other groups founded settlements at Dunedin in 1848 and Christchurch in 1850.

The South Island began to prosper soon after the British claimed New Zealand as a colony. The island's rich grasslands provided good grazing for sheep imported from Australia, and soon the settlers began exporting wool. In 1861, prospectors discovered gold in Otago. Immigrants poured into the country, hoping to strike it rich. Few miners were successful, but many stayed to become farmers.

The New Zealand Wars. As the colonists' demand for Maori land grew, disputes over land ownership became more common and more violent. War broke out in 1860 when a group of Maori disputed the government's purchase of tribal land in the Taranaki region. Government forces seized a Maori fortification built on the disputed land near Waitara. The initial fighting in the Waitara region lasted about a year.

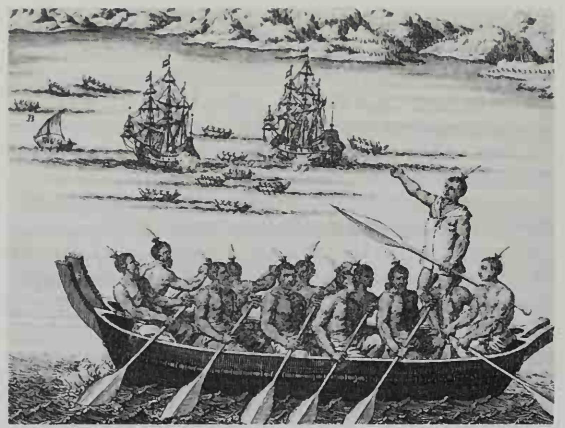
In July 1863, the British governor Sir George Grey ordered the invasion of the Waikato district, a Maori-occupied region on the North Island's western side. Grey had heard rumors that the Waikato Maori forces intended to attack Auckland. He was supported by the settlers who wanted to open up the Waikato's fertile grazing lands to British settlement. The wars continued until 1872.

In 1865, the colonial government created an agency called the Native Land Court to establish individual titles to land. The court defied the traditional Maori belief that land belonged to the entire tribe, not to individuals. By the end of the 1800's, settlers had taken most Maori land. The Maori were forced to withdraw into the harshest and most isolated regions of the country.

Depression and social reform. The expense of fighting the Maori, along with shrinking profits from South Island gold mines, took a severe toll on New Zealand's economy. Heavy government borrowing to support colonization and development projects also weakened the economy. In the late 1870's, the country entered an economic depression that lasted until the 1890's. In 1890, the Liberal Party won control of the government and remained in power for 21 years.

The Liberal Party represented the first stable nationwide political party in New Zealand's history. The party, under the leadership of Richard John Seddon from 1893 to 1906, carried out an extensive program of social reform. In 1893, New Zealand became the first country to give women full voting rights.

Dominion status. In the early 1900's, New Zealanders began to develop a sense of national identity. In 1907, the United Kingdom granted New Zealand's request to become a *dominion,* a self-governing country within the British Empire. New refrigeration methods developed in the late 1800's contributed to New Zealand's growing prosperity. These methods made it possible to export large quantities of butter, cheese, and meat.



During World War I (1914-1918), New Zealand sent about 100,000 troops to Europe to fight with the Allies against Germany. These soldiers suffered heavy casualties, with about 1 in 7 killed.

The Great Depression. New Zealand was hard-hit by the worldwide Great Depression that began in the late 1920's. Unemployment and desperate living conditions led to rioting against the government in the major cities. In 1935, the people elected a Labour Party government. The party increased public works projects, such as railway and road construction and forest planting, to put men to work. In 1938, the government set up a social security program that included health care for all citizens and special benefits for the aged, children, and widows.

World War II. In 1939, New Zealand followed the United Kingdom in declaring war on Germany. New Zealand troops fought beside British troops in Europe and the Middle East. When Japan entered the war in 1941, New Zealand began to fear a Japanese invasion. As British power declined in the Pacific, New Zealand in-

Important dates in New Zealand

A.D. 1000's	Early Maori settlers lived in New Zealand.
1642	Abel Janszoon Tasman became the first European to sight New Zealand.
1769	James Cook landed on New Zealand and claimed it for Britain (now the United Kingdom).
1840	The British and Maori signed the Treaty of Waitangi, giving the British the right to govern New Zealand.
1860-1872	Settlers on the North Island fought the Maori in the New Zealand Wars.
1861	The New Zealand gold rush began.
1893	New Zealand became the first country to grant women the right to vote.
1907	New Zealand became a dominion within the British Empire.
1938	New Zealand set up a social security program that included health care for all citizens.
1984	New Zealand adopted a policy that banned nuclear weapons and nuclear-powered ships from its ports.
1997	Jenny Shipley became the first woman prime minister of New Zealand.

A drawing (1642) by Isaac Gilsemans from Abel Janszoon Tasman's Journal; Alexander Turnbull Library, Wellington, New Zealand

Maori in canoes attacked vessels of Dutch explorer Abel Janszoon Tasman along the New Zealand coast in 1642. Tasman and his crew had become the first Europeans to sight New Zealand.

creasingly relied on the United States. New Zealand fought beside the United States in the Pacific Islands.

During the war, New Zealand's domestic economy boomed. Manufacturing and farm production rose, and wages and prices stabilized. By the war's end in 1945, the country had climbed out of the Great Depression. The mid-1900's brought many years of prosperity.

International tensions developed between New Zealand and some of its overseas allies in the 1980's. In 1981, a tour by a South African rugby team caused controversy as many New Zealanders protested South Africa's policy of *apartheid* (racial segregation).

In 1984, Labour Party Prime Minister David Lange announced that New Zealand would ban ships carrying nuclear weapons or powered by nuclear reactors from entering its ports. This ban brought New Zealand into disagreement with the United States, a military ally. In 1986, the United States suspended its military duties to New Zealand under the ANZUS mutual defense treaty. The ANZUS treaty had been signed by Australia, New Zealand, and the United States in 1951. This suspension was partially lifted in 1999 to allow U.S. and New Zealand troops to participate in joint United Nations (UN) peacekeeping operations.

New Zealand also strongly opposed France's testing of nuclear weapons in the South Pacific. In 1985, the environmental organization Greenpeace planned to use its ship *Rainbow Warrior* to protest French nuclear tests in the Pacific. But French agents bombed and sank the ship in Auckland Harbour. France apologized for sinking the ship in New Zealand's waters but prevented the agents from serving out their prison terms in New Zealand. In 1996, New Zealand cosponsored a UN resolution to ban nuclear weapons from the Southern Hemisphere.

Maori-Pakeha relations. Since the 1840's, the Maori had protested abuses of the Treaty of Waitangi. In 1975, the Maori showed their discontent with a march to Wellington. In 1975, the New Zealand government set up a panel called the Waitangi Tribunal to investigate tribal land claims and suggest possible settlements. The panel consists of half Maori and half Pakeha members appointed by the governor general.

In 1995, the government reached a historic settlement with a group of Maori known as the Tainui. The settlement included the return of land, money, and a formal apology. Since then, the government has made settlements with several other Maori groups.

Political changes. In 1993, New Zealand adopted a *mixed member proportional system* of electing members of Parliament. In this system, some chairs are reserved for elected legislators, while others are divided among the parties that receive 5 percent or more of the popular vote according to their share of the total votes cast. In the 1996 election, the first held under the new system, no party won an outright majority. The number of seats held by third parties and Maoris increased dramatically. To obtain a majority, the National Party formed a coalition with the New Zealand First Party.

In 1997, Jenny Shipley became National Party leader as well as prime minister. Shipley was New Zealand's first woman prime minister. In elections held in 1999, a coalition of the Labour and Alliance parties won a majority of seats in Parliament. Helen Clark, the Labour Party's leader, became prime minister. In elections in 2002, a coalition of the Labour and Progressive Coalition parties won the most seats in Parliament. Clark remained as prime minister. Giselle M. Byrnes

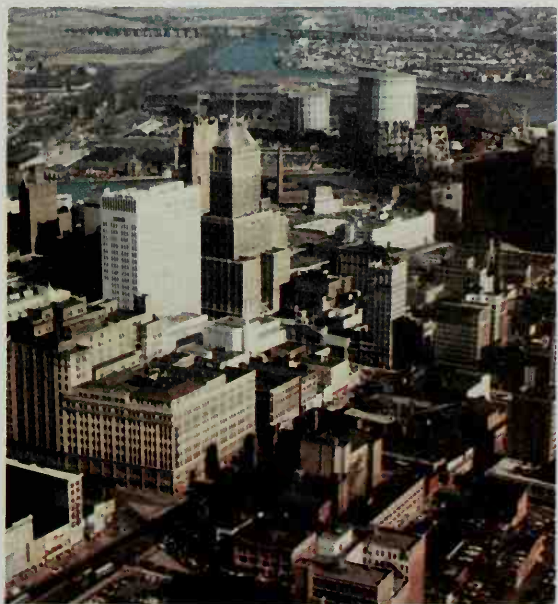
Newark, Delaware (pop. 28,547), is the home of the University of Delaware and a manufacturing and research center. It lies in northern Delaware, about halfway between New York City and Washington, D.C. For the location of Newark, see **Delaware** (political map).

Newark's products include automobiles, fine book papers, and pharmaceutical goods. Engineers develop electronic components in the city's research facilities. Newark was chartered in 1758. It has a council-manager form of government. Peter W. Rees



Newark, New Jersey (pop. 273,546; met. area pop. 2,032,989), is the largest city in New Jersey and one of the nation's leading centers of transportation. Newark lies on Newark Bay at the mouth of the Passaic River, about 10 miles (16 kilometers) west of New York City. For location, see **New Jersey** (political map).

In 1666, 30 Puritan families from the Connecticut Colony settled in what is now eastern New Jersey. Developers of the area had offered them religious freedom and inexpensive farmland. The settlers founded a village on the Passaic because the site included a harbor and level, unforested land. They named the village Newark—probably for Newark-on-Trent, the English town where their pastor had entered the ministry. The name may also have originated in the phrase *new ark,* a reference to the Ark of the Convenant mentioned in the Bible (see **Ark of the Covenant**).

The city. Newark, the county seat of Essex County, covers about 24 square miles (62 square kilometers). The Newark metropolitan area consists of all of Essex, Morris, Sussex, Union, and Warren counties. Downtown Newark has the city's tallest building, the 34-story National Newark Building. Nearby is the First Presbyterian Church, Newark's oldest house of worship, completed in 1791. The Gateway, a group of office buildings and a hotel, rises in the eastern part of the downtown area.

African Americans make up more than half of Newark's population. The city also has many people of Italian, Portuguese, or Puerto Rican descent.

Economy. The production of drugs and chemicals ranks as the leading industrial activity in the city. Newark also manufactures electric equipment, processed food, metal products, and nonelectrical machinery.

New Jersey Newsphotos

Newark, New Jersey, lies on the west bank of the Passaic River, *rear,* where the river flows into Newark Bay. The city forms the center of a large industrial area in northeastern New Jersey.

Newark International Airport, a major passenger and cargo center, lies at the south end of town. Port Newark, a leading New Jersey port, handles the ships of more than 100 ship companies. It is the largest port in the United States for container ships, which carry cargo in large, separate containers. Passenger and freight railroads and about 240 trucking firms serve the city.

Newark ranks as the nation's third largest insurance center. Only companies in Hartford, Connecticut, and in New York City sell more insurance. Newark is the home of Prudential Insurance Company of America, the largest of its kind in the world. The city also serves as New Jersey's leading center of finance and trade. Newark has one daily newspaper, *The Star-Ledger.*

Education and cultural life. Newark's public school system includes more than 55 elementary schools and about 10 high schools. The city has about 40 parochial and private schools. Institutions of higher learning include the University of Medicine and Dentistry of New Jersey; the New Jersey Institute of Technology; the Newark campus of Rutgers, the State University of New Jersey; and the Seton Hall University School of Law.

The New Jersey Symphony Orchestra performs in the New Jersey Performing Arts Center. The Opera Theater performs in Newark's Symphony Hall. The Newark Museum features art collections, exhibits of science and industry, and a planetarium. The New Jersey Historical Society has a library and a museum of historic items.

Newark has about 40 parks. The largest one, Branch Brook Park, covers 486 acres (197 hectares) and includes more than 3,500 cherry trees.

Government. Newark has a mayor-council form of government. The voters elect a mayor and nine council

members to serve four-year terms. Property taxes are the city's leading source of revenue.

History. Delaware Indians lived in what is now the Newark area before white settlers first arrived in 1666. During the late 1700's, a number of tanners settled in Newark. The area had many hemlock trees, which furnished the bark used in making leather. By the early 1800's, about a third of the labor force worked in shoemaking and other leather industries.

The work of Seth Boyden, a Newark inventor, helped the city grow industrially during the early 1800's. Boyden developed such products as patent leather and an improved kind of cast iron. Advances in transportation also contributed to Newark's industrial growth. For example, the Morris Canal, completed in 1831, linked Newark with coal-mining areas in the Lehigh Valley of Pennsylvania. By 1834, a railroad connected Newark and the Hudson River, which separates New Jersey and New York City. Newark had a population of 19,732 when it was incorporated in 1836.

From 1840 to 1860, many German and Irish immigrants settled in Newark to fill the growing number of industrial jobs. By 1860, the city had 71,941 people. A wave of immigration that began in the late 1880's brought thousands of people from eastern and southern Europe to Newark. In 1910, the city had 347,469 people.

Port Newark opened in 1915, during World War I (1914-1918). Newark's chemical industry, which began in the 1870's, expanded greatly during the war and the 1920's. In 1930, the population reached a peak of 442,337.

During the Great Depression of the 1930's, more than 600 Newark factories closed and many neighborhoods became shabby. During World War II (1939-1945), jobs in defense plants drew thousands of African Americans from the South to Newark. They crowded into the city's run-down areas. Beginning in the 1950's, many middle-income families moved from Newark to the suburbs. By 1960, the city's population had fallen to 405,220.

By the mid-1960's, Newark had a large proportion of poor people. The city lacked money to provide adequate services. Almost half the voters were African Americans, but they had little political power. As a result, racial tensions mounted. In July 1967, five days of rioting shook the African American sections of Newark, causing 26 deaths and more than $10 million in property damage. Blacks had charged that widespread dishonesty existed in the city government. A series of investigations following the riots led to the conviction of Mayor Hugh Addonizio and other politicians for sharing illegal refunds on city contracts.

In 1970, the voters elected Newark's first African American mayor, Kenneth A. Gibson. Gibson had been city engineer. He won reelection three times and served as mayor until 1986.

In 1971, a dispute over working conditions developed between white Newark teachers and the city's board of education. As a result of appointments made by Gibson, the board had a majority of black and Puerto Rican members. The dispute led to an 11-week strike by the teachers, the longest in the history of a major U.S. city. This strike increased racial tension in Newark. The school board has since become an elective body.

During the late 1900's, Newark leaders worked to increase the city's job opportunities and improve its housing. The federal and state governments contributed large amounts of money to help with such problems. Much new construction took place in Newark. A series of urban renewal projects begun in the 1960's resulted in the construction of some factories and office buildings. Newark Airport continued a major expansion program started in 1963. Several new university campuses and seaport expansion projects were completed in the 1970's. Construction of new office buildings took place in the 1980's and 1990's. Robert M. Hordon

For the monthly weather, see New Jersey (Climate).

Newbery, John (1713-1767), was an English publisher and bookseller. He is famous in the history of children's literature as the first person to print and sell books for children. He published *A Little Pretty Pocket-Book* (1744) and *Goody-Two-Shoes* (1765) and many other little volumes bound in "flowery gilt," a colorful paper from the Netherlands. Many of his books were reprinted in America between 1749 and 1831.

Newbery's bookshop, The Bible and Sun, was in St. Paul's Churchyard, London. He was the friend and patron of Oliver Goldsmith, Samuel Johnson, and many other literary people of his day. Goldsmith portrayed him in his novel, *The Vicar of Wakefield* (1766). It is believed that Goldsmith wrote some of the quaint penny books published by Newbery. These little books are now highly prized.

Newbery was born in Berkshire. The Newbery Medal, which has been awarded each year since 1922 for the finest children's book written by an American, was named for him (see Newbery Medal). Jill P. May

See also Literature for children (The 1700's); Mother Goose.

Newbery Medal is an annual award given to the author of the most distinguished contribution to American children's literature published in the preceding year. The award was established and endowed in 1921 by Frederic G. Melcher, chairman of the board of R. R. Bowker Co., publishers of the *Library Journal* and *Publishers' Weekly*. He named it for John Newbery, an English publisher and bookseller. Melcher also founded the Caldecott Medal. This award is presented annually to the illustrator of the outstanding children's picture book of the preceding year.

René Chambellan designed the Newbery Medal. It is awarded by the Association for Library Service to Children of the American Library Association.

Critically reviewed by the Association for Library Service to Children

Newcastle (pop. 133,686) is one of the largest cities in the Australian state of New South Wales. Newcastle lies along the southeast coast of Australia (see **Australia** [political map]). Newcastle is an important industrial and shipping center. Its major industries include the production of steel and base metals. Many buildings date from the 1800's, including Fort Scratchley, the Custom House, Public School, Police Station, and Railway Station. The city is the home of the University of Newcastle.

Permanent European settlement of Newcastle began in 1804, when convicts were sent there from Sydney. The city served as a place of punishment for prisoners until 1824. Newcastle received the status of a city in 1885.

Alan Fitzgerald

Newcastle upon Tyne (pop. 263,000; met. area pop. 1,087,000) is a commercial and manufacturing center of northern England. The city, usually called Newcastle, was formerly a center for mining coal. The expression "carrying coals to Newcastle" means taking something to a place that has more than it needs. Newcastle lies on the Tyne River, near the North Sea (see **England** [political map]). It is named after a castle built about 1080 by a son of William the Conqueror, a king of England.

Coal mining and shipbuilding were the city's chief industries from the 1700's until the 1930's. These industries have been largely replaced by the food processing industry and the manufacture of chemical products and heavy engineering equipment. The city is the home of the University of Newcastle upon Tyne. M. Trevor Wild

Newcomen, *noo KUHM uhn,* **Thomas** (1663-1729), an English inventor, built the first commercially successful steam engine in 1712. His steam engine was used widely in Europe and throughout Britain's coal-mining regions to remove water from mines. It remained popular for over 60 years until the Scottish engineer James Watt developed a greatly improved steam engine.

Newcomen was born in Dartmouth. While selling metal tools, he learned of the difficulty of pumping water from tin mines. He developed an engine that was driven by air pressure. Water was injected into a large metal cylinder filled with steam, condensing the steam and creating a vacuum. The weight of the atmosphere then pushed a piston to the bottom of the cylinder, pulling up the pumps connected to the piston and raising water. To sell his engines, Newcomen formed a partnership with inventor Thomas Savery, who had a patent on a different device that raised water from mines. Newcomen engines could pump over $3\frac{1}{2}$ million gallons (13.2 million liters) of water a day. Bruce E. Seely

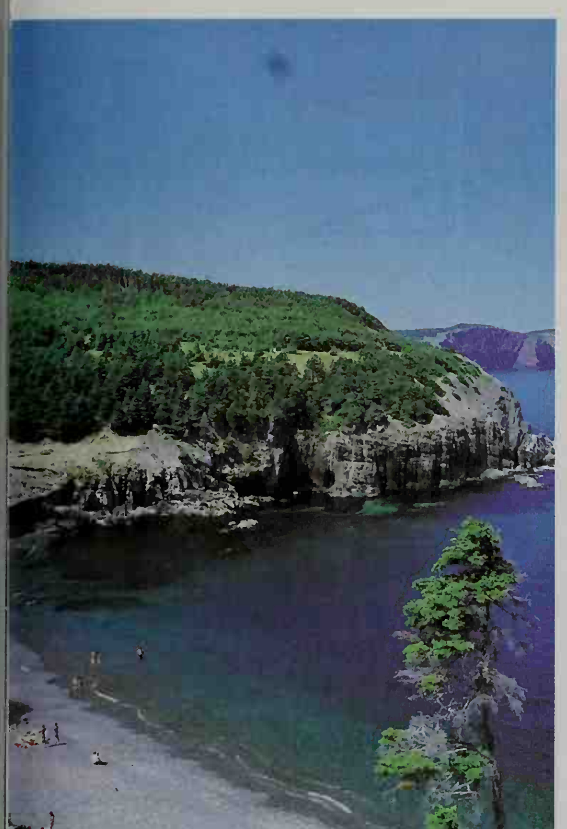
Fishing boats docked at St. John's, Newfoundland and Labrador's capital and largest city

Newfoundland and Labrador

Newfoundland and Labrador, *NOO fuhnd LAND,* is Canada's newest province. It became a province in 1949. It includes the island of Newfoundland and the coast of Labrador, a part of the Canadian mainland. St. John's, the capital and largest city of Newfoundland and Labrador, ranks among the oldest communities in North America.

For many years, the province's official name was simply Newfoundland. Canada's Parliament changed the official name to Newfoundland and Labrador in 2001.

Fewer people live in Newfoundland and Labrador than in any other province except Prince Edward Island. Most of the land is rugged, especially along the rocky coast. Thick forests grow along tumbling rivers and around sparkling blue lakes. Barren, rocky ridges rise above the green valleys and surround many brown *peat bogs* (swamps of decayed plants). Arctic winds and ocean currents chill the land and keep the climate cool. Storms occur frequently. Fog often covers the coast.



The contributors of this article are Simon M. Evans, former Professor of Geography at the Memorial University of Newfoundland; and Shannon Patrick Ryan, Associate Professor of History at the Memorial University of Newfoundland.

Almost all of the province's people live near the sea. Hundreds of villages and fishing settlements nestle in small, sheltered bays along the coast. Some places, too small to appear on maps, have such unusual names as Crow Head, Dragon's Bay, and Juniper Stump.

Most people in Newfoundland and Labrador belong to families that originally came from the United Kingdom and Ireland. The people of the many small, isolated fishing settlements, known as *outports,* have kept much of the language and customs of their ancestors. But this traditional way of life is being threatened by the decline of the fishing industry and by the rapid extension of modern transportation and communication systems.

The coastal waters of Newfoundland and Labrador have long been one of the world's richest fishing areas. For more than 300 years, fishing fleets from a variety of nations have come to share the bounty of the shallow Grand Banks, southeast of Newfoundland. However, bigger trawlers and more efficient ways of finding and catching fish have led to a drop in the numbers of cod and other fishes. As a result, Canada's government has established restrictions on fishing off Newfoundland.

Mining is an important industry in Newfoundland and Labrador. Offshore oil production became a valuable

Interesting facts about Newfoundland and Labrador

WORLD BOOK illustrations by Kevin Chadwick

The first successful transatlantic telegraph cable was completed when the *Great Eastern,* the steamship laying the cable, landed at Heart's Content on July 27, 1866. The *Great Eastern,* the largest ship in the world at the time, laid the cable on the ocean floor from Valentia, Ireland, to Newfoundland.

First transatlantic cable

Guglielmo Marconi received the first transatlantic wireless message at St. John's on Dec. 12, 1901. The Morse Code signal he received was a letter *s* sent from Cornwall, England. The signal was picked up by an aerial attached to a kite.

Guglielmo Marconi

Sir Humphrey Gilbert, an English explorer, arrived in Newfoundland in August 1583. It is sometimes considered England's oldest possession in North America. However, the United Kingdom did not formally recognize Newfoundland as a colony until 1824.

mining activity in the late 1990's. Iron ore mining on the Labrador Peninsula is also extremely important.

Manufacturing is also important to the province. Manufacturers use the province's extensive timber resources to produce wood pulp and paper.

Newfoundland and Labrador is the oldest English-speaking region of North America. Viking adventurers established a settlement at L'Anse aux Meadows about A.D. 1000. Sailors from the English port of Bristol probably reached the island of Newfoundland in the late 1400's. In 1497, John Cabot, an Italian explorer in the service of England, sailed through the rich fishing waters near Newfoundland. He brought news of the fishing back to Europe. The fisheries attracted many fishing crews, and some of those people settled on the island. During the 1500's, Basque people of southern France and northern Spain established semipermanent whaling and fishing settlements along the Labrador coast. Although its ships used Newfoundland as a fishing area for many years, the United Kingdom did not recognize Newfoundland as a colony until 1824.

For the relationship of Newfoundland and Labrador to the other provinces, see **Canada; Canada, Government of; Canada, History of.** See also **Labrador.**

Open-pit iron mine on the Labrador Peninsula

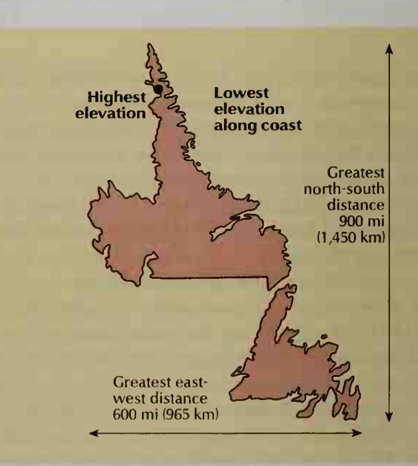
Newfoundland and Labrador in brief

Symbols of Newfoundland and Labrador

The provincial flag was adopted in 1980. The blue section represents Newfoundland and Labrador's ties to the United Kingdom. The red and gold symbolize hope for the future, with the arrow pointing the way. The coat of arms was granted by King Charles I of England in 1637 and officially adopted as a provincial symbol in 1928. The shield has two lions and two unicorns representing the United Kingdom. The Indians symbolize Newfoundland and Labrador's first inhabitants.

Provincial flag

Newfoundland and Labrador (brown) is the seventh largest province and the largest of the Atlantic Provinces (yellow).



The Confederation Building, headquarters of the Newfoundland and Labrador provincial government, is in St. John's, the capital since 1729.

General information

Entered the Dominion: March 31, 1949, the 10th province.
Provincial abbreviation: NF (postal).
Provincial motto: *Quaerite Prime Regnum Dei* (Seek Ye First the Kingdom of God).
Provincial song: "The Ode to Newfoundland." Words by Sir Cavendish Boyle; music by Sir Hubert Parry.

Land and climate

Area: 156,649 mi² (405,720 km²); the island of Newfoundland, 43,008 mi² (111,390 km²); Labrador, 113,641 mi² (294,330 km²).
Elevation: *Highest*—Mount Caubvick (called Mont d'Iberville in Quebec), 5,322 ft (1,622 m) above sea level. *Lowest*—sea level.
Coastline: The island of Newfoundland, 7,176 mi. (11,548 km). Labrador: 5,078 mi (8,172 km).
Record high temperature: 100 °F (38 °C) at Happy Valley-Goose Bay on July 4, 1944.
Record low temperature: −55 °F (−48 °C) at Ashuanipi on Feb. 7, 1950.
Average July temperature: 59 °F (14 °C).
Average January temperature: 19 °F (−7 °C).
Average yearly precipitation: 44 in (111 cm).

Important dates

1583 Sir Humphrey Gilbert landed in Newfoundland and claimed the region for England.

1713 The Treaty of Utrecht gave Newfoundland to Britain.

1763 Britain obtained Labrador from France in the Treaty of Paris.

1832 The United Kingdom granted Newfoundland the right to elect a general assembly.

Sources of information

For information on tourism in Newfoundland and Labrador, write to: Tourism Newfoundland and Labrador, P.O. Box 8730, St. John's, NF A1B 4K2. Tourism Newfoundland and Labrador's Web site at www.gov.nf.ca/tourism also provides tourist information. The Newfoundland Information Service handles requests for information about economy, government, and history in the province. Write to: Newfoundland Information Service, Communications and Consultation Branch, 10th Floor, East Block, Confederation Building, St. John's, NF A1C 5T7.

1934 Newfoundland appealed to the United Kingdom for financial assistance and became a British dependency.

1949 Newfoundland became the 10th province on March 31.

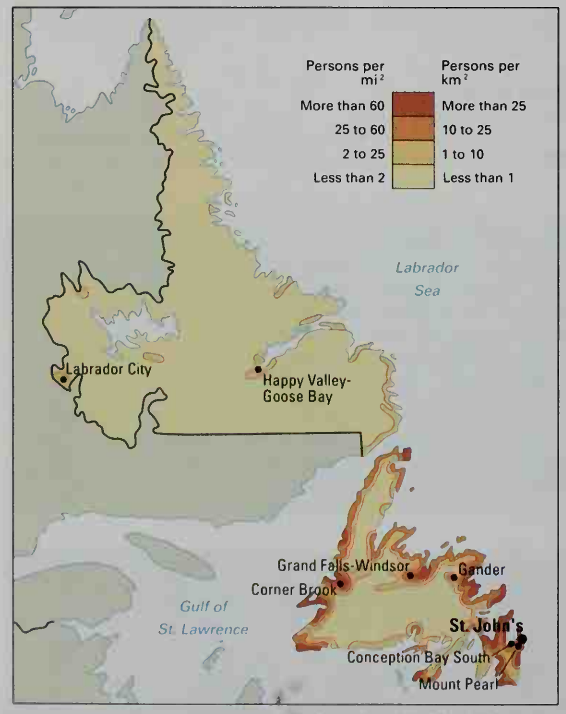
1967 Construction began on a $950-million hydroelectric plant in Churchill Falls in Labrador.

2001 Newfoundland's name was officially changed to Newfoundland and Labrador.

People

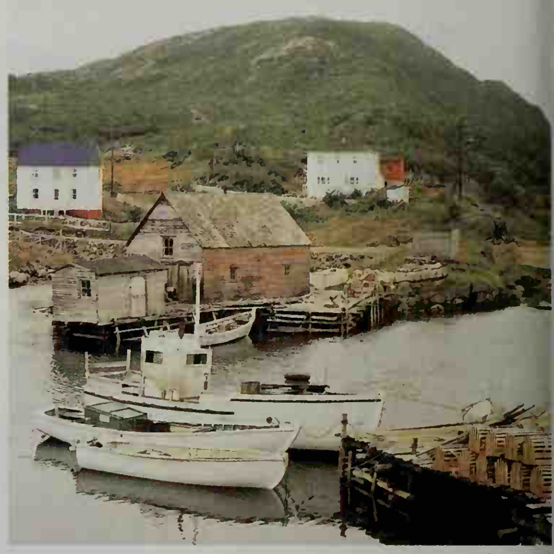
Population. The 2001 Canadian census reported that Newfoundland and Labrador had 512,930 people. The province's population had decreased by about 7 percent since the 1996 census, which reported a total of 551,792.

St. John's, on the Avalon Peninsula, is Newfoundland and Labrador's capital and largest city. It is the center of the province's only Census Metropolitan Area as defined by Statistics Canada. For the metropolitan area population, see the *Index* to the political map of Newfoundland and Labrador. About one-third of the province's people live in the metropolitan area.



Corner Brook and Mount Pearl are Newfoundland and Labrador's only other cities. About two-thirds of the province's people live in communities with populations of more than 1,000 persons. Almost all these settlements lie near the coast. Only approximately 3 of every 100 people in the province live in communities on the coast of Labrador. For more information, see the separate articles on Newfoundland and Labrador cities and towns listed in the *Related articles* at the end of this article.

Nearly all the people of Newfoundland and Labrador are of British, Irish, French, or Aboriginal (Innu or Inuit) descent. Less than 2 percent of the population was born outside Canada. Most of these people came from the United Kingdom or the United States.



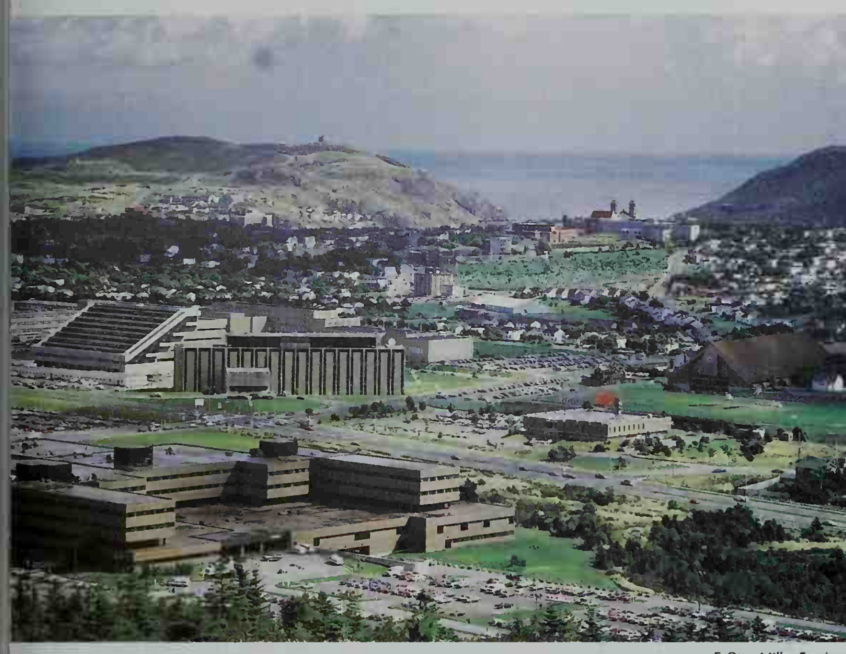
Schools in Newfoundland and Labrador operate under a single school system. Eleven school boards in the province administer the daily operations of the schools. Each school board consists of 15 elected members.

Population density

Over 90 percent of the province's people live near the coast of the island of Newfoundland. St. John's is the capital and largest city. The Labrador area has relatively few people.

WORLD BOOK map; based on the *National Atlas of Canada.*

Wayne Sproul, Hot Shots



The small village of Salvage lies on the rugged coast of Bonavista Bay. About a third of Newfoundland and Labrador's people live in communities that have fewer than 1,000 people.

Provincial law requires children in Newfoundland and Labrador to attend school from age 6 to age 16. The provincial government finances all public education from kindergarten through grade 12. For the number of students and teachers in Newfoundland and Labrador, see **Education** (table).

The province's one university—Memorial University—was founded in 1925. It includes the main campus and the Fisheries and Marine Institute in St. John's; Sir Wilfred Grenfell College in Corner Brook; the Frecker Program on the French island of St.-Pierre; and a residential campus in Harlow, England. The College of the North Atlantic operates more than 15 campuses in the province with headquarters in Stephenville. The college offers vocational and technical training, as well as first-year university courses.

In addition to the publicly funded education system, the province regulates a number of private elementary and secondary schools and vocational and technical training schools. These institutions operate either as businesses, as not-for-profit organizations, or as specially funded schools.

Libraries and museums. In 1934, Newfoundland established its first public library, the Gosling Memorial Library in St. John's. Today, the province has more than 100 libraries. The Arts and Culture Centre in St. John's houses the main branch of the province's public library as well as the Art Gallery of Newfoundland and Labrador. The Provincial Museum of Newfoundland and Labrador in St. John's features historical and cultural exhibits. The Southern Newfoundland Seaman's Museum in Grand Bank—a branch of the Provincial Museum—has exhibits on the maritime history of Newfoundland's southern coast. The North Atlantic Aviation Museum, in Gander, features vintage aircraft and exhibits on Gander's aviation history. Community museums highlight local heritage collections throughout the province.

E. Otto, Miller Services

Memorial University, in St. John's, is Newfoundland and Labrador's only university. The school was founded in 1925 as Memorial University College and began granting degrees in 1950.

Visitor's guide

Newfoundland and Labrador has capes and bays, wooded river valleys, and Arctic tundra that provide some of the most spectacular scenery in North America. The province also offers excellent hunting and fishing, and many vacationers participate in these activities.

The towns and villages of Newfoundland and Labrador are rich in folk traditions that were brought from other countries by early settlers and still survive. Many community events and provincewide folk festivals feature these traditions. Newfoundland and Labrador also has many community museums and historic sites that reflect the history and heritage of the people.

Bruce Paton, Canadian Tourism Commissio

Port de Grave on Conception Bay

Places to visit

Following are brief descriptions of some of Newfoundland and Labrador's most interesting places to visit:

Cape St. Mary's Ecological Reserve, on the Avalon Peninsula, is one of the largest nesting sites for gannets in North America. More than 5,000 pairs of these large sea birds arrive at the sanctuary each spring to raise their young on the cliff faces. Cape St. Mary's is also a good place to see whales in summer.

Placentia, on the west coast of the Avalon Peninsula, was established by the French in 1662. It was the scene of several historic battles during the 1700's. Prime Minister Winston Churchill of the United Kingdom and President Franklin D. Roosevelt of the United States drew up the Atlantic Charter on a warship near Placentia in 1941.

Port de Grave, on Conception Bay, is one of the most scenic areas in Newfoundland. It attracts sightseers, artists, and photographers from all over the world.

Witless Bay is a small fishing village 20 miles (32 kilometers) south of St. John's. Just offshore is the Witless Bay Ecological Reserve, the nesting area for hundreds of thousands of puffins and murres, and many other sea birds. The reserve is als a good place to see humpback and minke whales in summer

National parks and sites. Newfoundland and Labrador has tw national parks—Gros Morne and Terra Nova. Gros Morne lie on the west coast, and Terra Nova is on the eastern shore. National historic sites include Castle Hill, near Placentia; Cape Spear, near St. John's; Hawthorne Cottage, in Brigus; L'Anse aux Meadows; Port au Choix, on the Great Northern Peninsula; and Signal Hill, in St. John's. For the features of these parks and sites, see **Canada** (National park system).

The largest provincial park in Newfoundland and Labrador is Barachois Pond Park near St. George's, in the middle of the towering Long Range Mountains. Sir Richard Squires Memorial Park, located on the Humber River, includes the famous Big Falls. Every spring, Atlantic salmon make spectacular jumps up the falls to reach their *spawning* (egg-laying) grounds upstream. For information on provincial parks, writ to Department of Tourism, Culture, and Recreation; Parks Division; P.O. Box 8700; St. John's, A1B 4J6.

Annual events

January-April
Corner Brook Winter Festival (February); Mount Pearl Frosty Festival (February); Grand Bank Winter Carnival (March); Newfoundland and Labrador Drama Festival (held in a different location every year in April).

June-September
St. John's Day in St. John's (weekend nearest June 24); Gros Morne Theatre Festival in Cow Head (June-September); Festival of Folk Song and Dance (July); Stephenville Festival, a theater festival (July); Strawberry Festival in Humber Valley (July); Twillingate's Fish, Fun, and Folk Festival (late July); Trinity Pageant (July and August); St. John's Regatta (first Wednesday in August); Bakeapple Folk Festival in Forteau (August); Newfoundland and Labrador Folk Festival in St. John's (August).

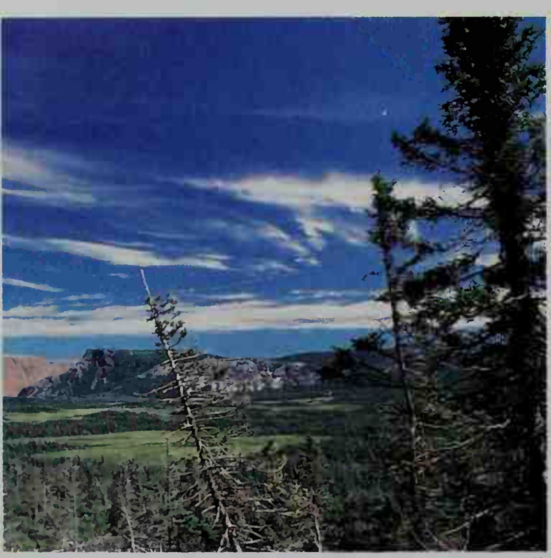
Land regions. Newfoundland and Labrador includes parts of two land regions: (1) the Canadian Shield, and (2) the Appalachian Region.

The Canadian Shield covers about half of Canada, including all of Labrador. It is a rough plateau made up of ancient rocks. In Labrador, the edge of this plateau is cut by valleys and by swift rivers that drain into the Atlantic Ocean. Forests cover more than half of Labrador. Southwestern Labrador has many lakes. It also has rich deposits of iron ore. See **Canadian Shield.**



The Appalachian Region extends through the eastern part of North America from the island of Newfoundland to Alabama. Lowlands form the eastern edge of the island. To the west, the land gradually rises to a plateau with parts more than 2,000 feet (610 meters) above sea level. In the central part of the island, rocky ridges rise from forested valleys. Lakes, ponds, and bogs dot the area. Three peninsulas—the Great Northern, the Avalon, and the Burin—stick out from the island. The mountainous Great Northern Peninsula points northeastward toward Labrador. Forests cover most of it. The Avalon Peninsula, in the southeast, is the most heavily populated part of the province. About 40 percent of the people live there. To the west, across Placentia Bay, lies the hilly Burin Peninsula.

Coastline of Newfoundland and Labrador is broken by *fiords* (long inlets) and many bays. The island of Newfoundland has 7,176 miles (11,548 kilometers) of coastline. Labrador's coastline is 5,078 miles (8,172 kilometers) long. Thousands of small islands with a total coastline of 5,739 miles (9,236 kilometers) dot the coastal waters.

Mountains. The highest point in Newfoundland and Labrador is Mount Caubvick. This peak in the Torngat Mountains is part of the boundary between Quebec and Newfoundland and Labrador. In Quebec, it is known as Mont d'Iberville. It rises 5,322 feet (1,622 meters) above sea level. The Mealy Mountains, in southern Labrador, are over 4,000 feet (1,200 meters) high. On the island of Newfoundland, the chief mountains are the Long Range Mountains. The Lewis Hills have the island's highest elevation—2,672 feet (814 meters) above sea level.

Rivers and lakes. The Churchill River in Labrador is Newfoundland and Labrador's longest river. It rises near the Quebec border and flows 600 miles (966 kilometers) to the Atlantic Ocean. On the island of Newfoundland, the Exploits River flows 153 miles (246 kilometers) northeast from Red Indian Lake into Notre Dame Bay.

Labrador's largest lake is Lake Melville, which covers 1,133 square miles (2,934 square kilometers). The next largest Labrador lakes are Michikamau, Lobstick, and

Hans Blohm, Masterfile

Rocky ridges rise from forested valleys in the Appalachian Region of the province. This region covers the entire island of Newfoundland and includes many lakes, ponds, and bogs.

Dyke lakes, and Lac Joseph. On the island of Newfoundland, Grand Lake is the largest, followed by Red Indian and Gander lakes. Grand Lake covers 205 square miles (531 square kilometers).

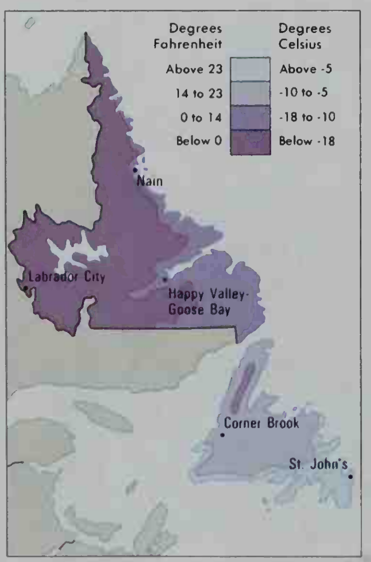
Plant and animal life. Forests cover about 87,000 square miles (225,000 square kilometers) of the province. Balsam fir and spruce, the most common trees, supply wood for Newfoundland and Labrador's pulp and paper industry. Other trees include the aspen, birch, larch, pine, and white spruce. Shrubs, lichens, and mosses grow at high elevations. Wildflowers, such as butterworts, Canada mayflowers, goldthreads, Indian pipes, pink lady's-slippers, starflowers, and twinflowers, also grow in the province. The pitcher plant, Newfoundland and Labrador's provincial flower, grows in bog areas.

Many species of fish have flourished in the shallow waters surrounding the island of Newfoundland and extending along the Labrador coast. A major habitat for fish is Grand Banks, an underwater plateau. The main species there include capelin, cod, crab, flounder, herring, lobster, plaice, redfish, and scallops.

About 30 kinds of animals live in the province. They include Arctic hares, bears, beavers, caribou, foxes, lynxes, moose, otters, rabbits, seals, and weasels. Two famous breeds of dogs, the Labrador retriever and the Newfoundland, were developed in the province (see **Labrador retriever; Newfoundland dog**).

Some birds live in Newfoundland and Labrador all year, but many kinds visit the province. Ptarmigans and ruffed grouse live in the province. Ducks, geese, and snipes visit every summer. Gulls, loons, murres, puffins, terns, and other sea birds feed in the coastal waters.

Climate. The cold Labrador Current and arctic winds keep the province cool (see **Labrador Current**). But the climate varies greatly between Labrador and Newfoundland. On the island, January temperatures in St. John's average 24 °F (−4 °C). Along the Labrador coast, average January temperatures range from 4 to −2 °F (−16 to −19 °C). July temperatures average about 60 °F (16 °C) in St. John's and about 50 °F (10 °C) in coastal Labrador. The province's highest and lowest temperatures occurred in central Labrador. Happy Valley-Goose Bay had the highest temperature, 100 °F (38 °C), on July 4, 1944. The record low, −55 °F (−48 °C), occurred at Sandgirt Lake on Jan. 17, 1946, and at Ashuanipi on Feb. 7, 1950.



Newfoundland and Labrador's annual *precipitation* (rain, melted snow, and other forms of moisture) ranges from about 20 inches (51 centimeters) in Northern Labrador to 60 inches (150 centimeters) at St. John's. Average yearly snowfall ranges from 77 inches (196 centimeters) on the island to about 170 inches (430 centimeters) in Labrador.

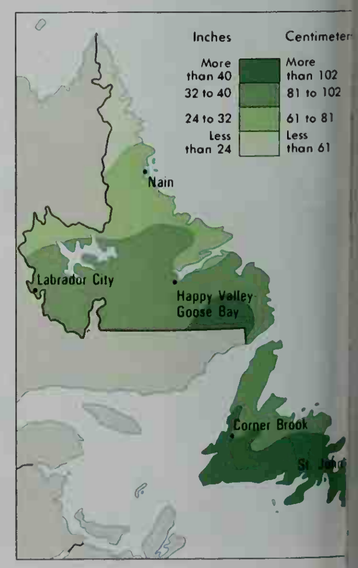
Average January temperatures

The province's winters are much colder on the Labrador mainland than they are on the island of Newfoundland.



Average July temperatures

The province generally is cool during summertime. The warmest temperatures are found on the island of Newfoundland.

Average yearly precipitation

The island of Newfoundland and the southern mainland receive the most precipitation. The north is the driest section.

WORLD BOOK maps; based on the *National Atlas of Canada*

Newfoundland and Labrador's goods-producing in-
ustries depend on its natural resources. These include
on ore from Labrador, pulpwood from the island of
lewfoundland, fish from the Atlantic Ocean, and oil ex-
acted off the coasts. The province exports its goods to
ne United States, Europe, Asia, and other markets. Serv-
e industries account for the largest part of the
rovince's *gross domestic product* (GDP)—the total value
f goods and services produced in a year. Tourism is a
rowing part of the economy, and tourist spending con-
ibutes significantly to the GDP.

Because of a depletion of fish stocks in the Atlantic
cean off the coasts of Newfoundland and Labrador, a
eries of fishing restrictions went into effect beginning
the early 1990's. Restrictions included banning catch-
s of various *groundfish* (fish that swim close to the
cean floor), in particular cod. Some limited fishing of
roundfish has been permitted since the late 1990's.
owever, shellfish catches dominate the industry.

Natural resources. Newfoundland and Labrador has
ome of the world's largest known iron-ore deposits. A
gnificant deposit of nickel, copper, and cobalt was dis-
overed in 1996. Other minerals include dolomite, gold,
ypsum, limestone, pyrophyllite, sand and gravel, silver,
nd slate. Oil production off the eastern coast began in
997. Natural gas deposits also exist in the area, but have
ot yet been tapped. The province's large forests are

Production and workers by economic activities

Source: Statistics Canada.

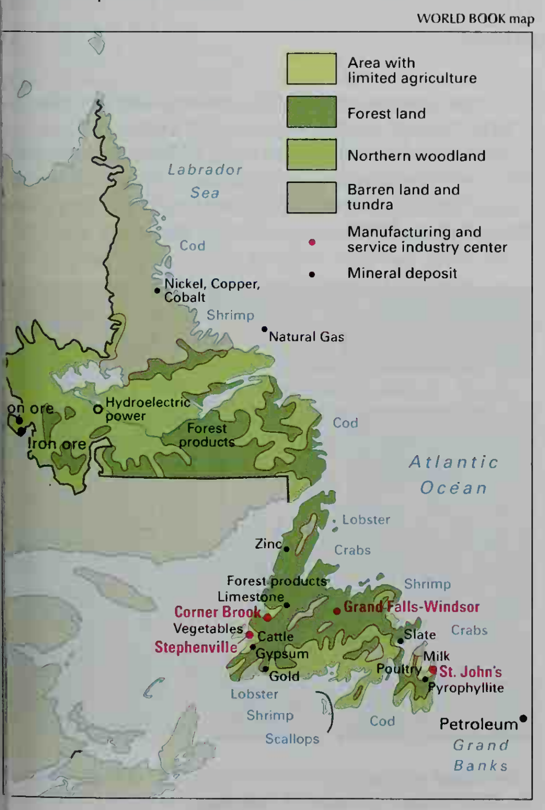
valuable natural resources. Although soil is coarse and rocky in most places, the province contains vast stretches of wilderness and startling geological formations.

Service industries account for the largest portion of the province's GDP. The leading group of service industries provides community, business, and personal services. Such services include computer services, education, engineering, food and accommodation, health care, and research. Memorial University in St. John's is one of the world's leading centers of ocean research.

Finance, insurance, and real estate form the second most important service industry in terms of the GDP. St. John's is the province's chief banking center.

Wholesale and retail trade rank third among the service industries. This group is the province's second-leading employer. Trade involves the distribution and sale of goods, especially food products and motor vehicles.

Other service industries in Newfoundland and Labrador include (1) transportation and communication and (2) government services. Ships and trucks transport many manufactured goods to market. Telephone and cable television companies are the leading types of communication companies. Information about transportation and communication also appears later in this section. Most government activities are centered in St. John's.



Mining. Oil production is the province's newest mining industry. Production started from the large offshore Hibernia field in late 1997. Within a few years, oil had become the province's most valuable mined product. Plans for developing other fields are under way.

Iron ore ranks second among Newfoundland and Labrador's mined products. All of the iron ore comes from two mines in Labrador, one at Labrador City and the other at Wabush. The province provides about half of Canada's iron ore. Smaller mines throughout the province produce a variety of minerals, including gold, gypsum, and limestone. The discovery of a significant nickel, copper, and cobalt deposit at Voisey's Bay in

conomy of Newfoundland and Labrador

nis map shows the economic uses of land in Newfoundland
nd Labrador and where the leading farm, mineral, and forest
oducts are produced. Industrial centers are shown in red.

WORLD BOOK map

Labrador has fueled further exploration.

Manufacturing. Newfoundland and Labrador's manufactured products have an annual *value added by manufacture* of about 800 million Canadian dollars. This figure represents the increase in value of raw materials after they become finished products. The province's leading manufactured goods are newsprint and food and beverage products. Large paper mills in Corner Brook, Grand Falls, and Stephenville are among the province's main employers. Fish products are the leading food product. Other manufactured products include aerospace equipment, boats, concrete, lumber, petroleum products, and printed materials.

Fishing has traditionally been very important to the economy of Newfoundland and Labrador. Before fishing restrictions were imposed in the early 1990's, cod was the leading fish catch. Today, such shellfish as crab, lobster, scallops, and shrimp make up the leading catches.

Forestry. Fir and spruce provide much of the timber harvested in Newfoundland and Labrador. Most of the province's timber is used to make newsprint. The rest is used for lumber and firewood.

Agriculture. Due to the lack of fertile soil, agriculture provides less income in Newfoundland and Labrador than in any other province. The leading farm products are chickens, eggs, and milk. The province's farmers also raise cattle and hogs and a variety of vegetables.

Electric power and utilities. Hydroelectric plants supply about 95 percent of the electric power produced in the province. The rest comes from plants that burn petroleum. The largest hydroelectric plant lies on the Churchill River in Labrador. Most of the power from this plant is sold to a utility company in Quebec. Other utility companies provide gas and water service.

Transportation. Newfoundland and Labrador lies nearer Europe than any other part of North America except Greenland. This location made the province an important stopping point for airplanes and ships traveling across the Atlantic. But increases in the range of planes and ships have reduced the need for refueling stops.

Gander and St. John's have Newfoundland and Labrador's busiest airports. National and regional airlines serve the province. Labrador has the province's only rail line. Trains use this line to transport iron ore from western Labrador to Sept-Îles, Quebec.

Newfoundland and Labrador has about 5,500 miles (8,900 kilometers) of roads. Part of the Trans-Canada Highway runs from St. John's to Channel-Port aux Basques (see **Trans-Canada Highway**). The province is constructing a Trans-Labrador Highway to connect different regions of Labrador. A ferry service operates the year around between Channel-Port aux Basques and North Sydney, Nova Scotia, and ferries run between Argentia and North Sydney during the summer months. Freighters sail to St. John's, Corner Brook, Argentia, and Harbour Grace from Toronto, Montreal, and Halifax.

Communication. Newfoundland and Labrador has about 20 newspapers, 2 of which are dailies. *The Telegram*, the oldest and largest daily, was established in St. John's in 1879. About 40 radio stations and 4 television stations serve the province. Cable television systems serve a number of communities. A fiber-optic transmission system across the province provides access to high-quality digital telecommunications.

Government

Lieutenant governor of Newfoundland and Labrador represents the British monarch, Queen Elizabeth II, in her role as queen of Canada. The lieutenant governor is appointed by the governor general in council of Canada. The lieutenant governor is considered the head of state, but the position is largely ceremonial.

Premier of Newfoundland and Labrador is the actual head of the provincial government. Newfoundland and Labrador, like the other provinces and Canada itself, has a *parliamentary* form of government. The premier is an elected member of the House of Assembly. The person who serves as premier is usually the leader of the majority party in the Assembly. The premier must have the support of a majority of the Assembly.

The premier presides over the Executive Council (cabinet). The council includes ministers appointed by the lieutenant governor on the advice of the premier. Most of the appointees are members of the premier's party in the House of Assembly. Most ministers direct one or more branches of the government. The council, like the premier, must have the support of the majority of the Assembly. Otherwise, the council must resign, or else its supporters must win a majority of seats in the Assembly in a new general election.

House of Assembly is a one-house legislature. It passes the provincial laws. The Assembly has 48 members, each elected from 1 of 48 Assembly districts. Elections must occur at least once every five years. Usually, the lieutenant governor calls a general election after a shorter period, on the advice of the premier.

Courts in Newfoundland and Labrador include the Supreme Court and its regional judicial centers, as well as the Provincial Court, which has branches throughout the province. The Supreme Court has appeal and trial

Office of the Spe[aker]

The House of Assembly meets in chambers in the Confedera[-]tion Building in St. John's. The Assembly has 48 members.

The premiers of Newfoundland and Labrador

	Party	Term
Joseph R. Smallwood	Liberal	1949-1972
Frank D. Moores*	Progressive Cons.	1972-1979
A. Brian Peckford*	Progressive Cons.	1979-1989
Thomas Rideout*	Progressive Cons.	1989
Clyde Kirby Wells	Liberal	1989-1996
Brian Tobin	Liberal	1996-2000
Beaton Tulk	Liberal	2000-2001
Roger D. Grimes	Liberal	2001-

*Progressive Conservative.

livisions. The appeal division has a chief justice and 6 udges. The trial division consists of a chief justice and 8 judges. The Canadian governor general in council ap- oints Supreme Court justices. The Executive Council ppoints judges to the 12 Provincial Court centers.

Local government. St. John's, Corner Brook, and Mount Pearl, Newfoundland and Labrador's three cities, operate under city acts passed by the provincial legislature. Each of the province's incorporated towns and incorporated communities is governed by an elected council. Town councils have from 5 to 11 members who serve four-year terms.

Revenue. Federal grants, corporation taxes, and personal income taxes account for most of the province's income. Additional funds come from service fees and from sales taxes on gasoline, alcoholic beverages, and other products. The province also collects license fees and royalties on the use of natural resources.

Politics. Newfoundland and Labrador has three major political parties—the Liberals, the Progressive Conservatives, and the New Democrats. The Liberals gained power in 1949 and held it throughout the 1950's and 1960's under the leadership of Premier Joseph R. Smallwood. The Conservatives held power from 1972 to 1989. The Liberals regained power in 1989.

History

Early European exploration. Viking explorers prob- bly were the first white people to live in Newfound- ind. In 1961, archaeologists discovered the ruins of a 'iking settlement on the northern tip of the island. This ettlement was established about A.D. 1000.

English fishing crews from Bristol probably reached lewfoundland in the late 1400's. John Cabot, an Italian xplorer in the service of England, may have landed on lewfoundland or Nova Scotia in 1497. Cabot thought he ad reached Asia. He brought news of Newfoundland's ch fishing to Europe.

Following Cabot's voyage, hundreds of French, Por- iguese, and Spanish fishing fleets visited Newfound- ind. Among these fishing crews were Basque whale unters of southern France and northern Spain. Some asques established a base at Red Bay, on the southeast oast of Labrador. At that time, Beothuk Indians lived in ewfoundland. During the 1700's, Micmac Indians set- ed chiefly along the southern coast of Newfoundland. he Beothuk Indians, who became confined to the inte- or, were unable to compete successfully for resources jainst the Europeans and the Micmac. They were also isceptible to the diseases the Europeans brought with iem. By 1829, the Beothuk had disappeared.

The Innu, also known as the Naskapi and Montagnais idians, have lived in southern and central Labrador for ousands of years. The Inuit, formerly called Eskimos, ive lived along the coast of northern Labrador for ousands of years.

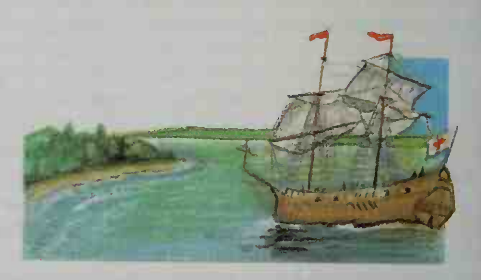
Colonization. By the late 1500's, English fishing fleets orked and settled mainly along the southern part of e east coast of Newfoundland. French fishing fleets ontrolled the north and south coasts. But English, ench, Spanish, and Portuguese ships often anchored the same harbor. Each harbor was ruled by a "fishing lmiral." This official was the master of the first ship to rive at the beginning of the fishing season. In 1634, ng Charles I officially gave authority to the English fish- g admirals.

In 1583, the English explorer Sir Humphrey Gilbert ar- ved in St. John's and claimed Newfoundland as part of his new colony. However, he and his crew were lost at sea on their return voyage to England without having established an actual settlement in Newfoundland. John Guy, a merchant, arrived in 1610 with settlers sent by an English company. Guy formed a colony at Cupids, on Conception Bay. Although people continued to live in Cupids from then on, the colony failed as a commercial venture. In 1621, Sir George Calvert (later Lord Baltimore) established a major colony at Ferryland. In 1629, after an unusually cold winter, Calvert requested a royal grant of land farther south and went on to establish the colony of Maryland in what is now the United States.

In 1637, Charles I granted Newfoundland to Sir David Kirke and other nobles. Kirke set up headquarters at Ferryland but had no authority over the English fishing fleets who came to the island each summer. In 1651, the English government called Kirke back to England. After 1651, the English government discouraged further attempts at colonization in Newfoundland.

War with France. French settlers founded Placentia in 1662. Placentia quickly grew into a fortified colony that threatened the English in Newfoundland. England and France did not quarrel openly until William III became king of England in 1689. William declared war on France, and the French and English colonies in North America, including Newfoundland, became part of the battleground. In 1696 and 1697, the French destroyed all English settlements in Newfoundland. However, the war in Europe went against the French, and in 1713, the Treaty of Utrecht gave all of the island of Newfoundland to the British. France kept only the privilege of using part of the northern and western shore for drying fish. That area became known as the *French Shore.*

In 1729, the British government began to appoint naval officers as royal governors to rule Newfoundland during the summer—that is, the fishing season. Captain Henry Osborne became the first such "naval governor."



Britain (now the United Kingdom) obtained nearly all the rest of France's possessions in Canada by the Treaty of Paris, which ended the Seven Years' War in 1763. France received St.-Pierre and Miquelon islands from

Historic Newfoundland and Labrador

Viking explorers were probably the first white people to live on the island of Newfoundland. A Viking settlement on the island dates back to about A.D. 1000.

John Cabot, who sailed for England, may have landed on Newfoundland or Nova Scotia in 1497.

The British and French battled for control of what is now Newfoundland and Labrador during the Seven Years' War. In 1762, a French fleet seized St. John's. But the war ended as a great British victory in 1763.

The Labrador Boundary Decision of 1927 rejected Quebec's claims, *blue area, left,* and defined Newfoundland and Labrador's boundaries clearly, *right.*

A huge hydroelectric plant at Churchill Falls became fully operational in 1974. The plant, which has 11 generators, is one of the largest power projects in the Western Hemisphere.

Important dates in Newfoundland and Labrador

1497 John Cabot raised the banner of King Henry VII on a "new found land" which may have been the island of Newfoundland or Nova Scotia.

1583 Sir Humphrey Gilbert landed in Newfoundland and claimed the region as part of his new colony.

1637 Charles I granted Newfoundland to Sir David Kirke and his partners.

1662 The French established a garrison at Placentia.

1713 The Treaty of Utrecht gave Newfoundland to Britain (now the United Kingdom).

1729 Captain Henry Osborne became Newfoundland's first naval governor.

1763 In the Treaty of Paris, France surrendered Labrador to Britain.

1832 The United Kingdom granted Newfoundland the right to elect a general assembly.

1855 Newfoundland gained a "responsible government" that was controlled by an elected assembly.

1927 The British Privy Council established the present boundary between Quebec and what is now the province of Newfoundland and Labrador.

1934 The United Kingdom suspended Newfoundland's government, established a Commission of Government, and assumed Newfoundland's debts.

1949 Newfoundland became Canada's 10th province on March 31.

1958 Newfoundland introduced free hospitalization and programs for educational improvements.

1967 Construction began on a $950-million hydroelectric plant in Churchill Falls in Labrador. The plant's first two generators began operating in 1971.

2001 Canada's Parliament officially changed Newfoundland's name to Newfoundland and Labrador.

Britain and also regained its right to use the French Shore. France gave up this right in 1904.

After the Treaty of Paris, the British government placed the Labrador coast under the authority of Newfoundland's naval governor. The Labrador coast was placed under Quebec-British rule in 1774 and returned to Newfoundland's control in 1809.

Representation and independence. By 1815, about 40,000 people were living in Newfoundland. In 1817, Sir Francis Pickmore became the first governor to remain on the island after the close of the fishing season. Many people wanted a strong local government. Led by William Carson, a Scottish surgeon, the people repeatedly asked Parliament for authority to make their own laws. In 1832, the British government established a legislature for Newfoundland. It consisted of a governor, a council, and a general assembly elected by the people.

Newfoundland's new government was a "representative government" because the legislature could make laws. However, the British Parliament had to approve the laws, and a British governor enforced them. Soon, the assembly began to ask the British government for a "responsible government"—one in which the cabinet was controlled by the assembly and not by the governor. The British colonies in Canada had been granted this form of government in the 1840's. In 1855, Newfoundland was also allowed to set up such a government.

Economic growth. Until the mid-1800's, Newfoundland's economy was based chiefly on the fishing and seal industries. Dried cod, seal oil, and seal skins were major exports of the colony. In the 1860's, mineral exploration began, and by 1888, copper mining had become an important industry in Newfoundland. In the 1890's, an iron ore mine opened on Bell Island. A railway was constructed across Newfoundland from 1882 to 1896. The colony's first paper mill began operating in Grand Falls in 1909. This industrialization, together with a booming fishing industry, gave Newfoundland a strong economy.

In 1927, the British Privy Council established the present boundary between the coast of Labrador and Quebec. This decision gave Newfoundland (later known as Newfoundland and Labrador) the vast mineral resources of the Knob Lake and Wabush Lake regions.

Ruin and recovery. After World War I ended in 1918, Newfoundland's prosperity began to fade, chiefly because of the depression in international trade. In the 1920's, Newfoundland tried to revive its lagging industries and to develop new ones. But by 1930, the Great Depression had struck most of the world. Newfoundland's fish, iron ore, and newsprint markets collapsed. The government sank deeply into debt.

Under Prime Minister Frederick C. Alderdice, Newfoundland appealed to the United Kingdom for financial assistance under a new form of government. In 1934, the United Kingdom suspended Newfoundland's government and established a Commission of Government. This government consisted of a British governor and six other men, three of them Newfoundlanders. Newfoundland became a dependency, and the United Kingdom took over its debts.

Economic recovery came slowly. The government reorganized the civil service, improved education and health facilities, and sponsored research to improve agriculture. Newfoundland's fishing and logging industries got much-needed financial aid.

World War II (1939-1945) gave new life to Newfoundland's economy. The fisheries, factories, and mines once again increased production to fill wartime demands. Canada and the United States built military bases in Newfoundland. People at these bases created new demands for local products.

Confederation with Canada. In 1948, Newfoundland voters chose to unite with Canada rather than keep the Commission of Government or return to independent self-government. On March 31, 1949, Newfoundland became the 10th province of Canada. Joseph R. Smallwood, leader of the Liberal Party, was the first premier of the new province. Newfoundland was in sound financial condition at the time of confederation. But a wide gap existed between the standard of living in Newfoundland and many of the other nine provinces. Through confederation, Newfoundland began to share in federal social security benefits. The province participated in federal programs, including development of trade schools and the construction of more than 500 miles (800 kilometers) of the Trans-Canada Highway.

During the 1960's, Newfoundland expanded its industrial and educational facilities and its production and distribution of electric power. After a boom in mineral production, mining began to rival fishing as a major industry. New mines opened, mostly in Labrador.

By the late 1960's, Newfoundland's rural electrification program had brought electric service to over 100 isolated communities in the province. The principal project in the rural electrification program was a huge hydroelectric plant in Churchill Falls in Labrador. The plant began producing power in 1971, and all of its 11 generators were operating by 1974. The plant is one of the largest hydroelectric projects in the Western Hemisphere.

Leadership changes. In the 1971 provincial elections, the Liberals lost control of the legislature to the Progressive Conservative Party. Conservative leader Frank D. Moores became premier in 1972, ending 23 years of Liberal Party rule under Joseph R. Smallwood. Moores and his successor, A. Brian Peckford, also a Conservative, held the premiership for most of the 1970's and 1980's. The Liberals regained power in 1989.

Recent developments. From the time it became a province to the mid-1970's, Newfoundland's population grew rapidly. The growing population made it difficult to provide enough jobs. As a result, many people left the province to find work. In 1979, a major oil field was found off the eastern coast. But low oil prices contributed to a delay in the development of the field, and oil production did not begin until 1997. Provincial leaders hope the field will create enough new jobs to bring people back to the province.

In the early 1990's, the federal government banned fishing for cod in waters in and around Newfoundland because of a sharp drop in their numbers. The government also placed restrictions on other species. In 1994, the Northwest Atlantic Fisheries Organization (NAFO) agreed to observe the ban and restrictions. NAFO includes Canada and a number of other nations. More than 30,000 Newfoundland and Labrador workers have lost jobs in the fishing industry.

In 2001, Canada's Parliament changed the official name of the province to Newfoundland and Labrador.

The province's government had already been referring to the province by that name for many years.

Questions

What part of Newfoundland and Labrador is most populated?
What are the province's chief manufactured products?
How are Newfoundland and Labrador's schools organized?
What part of the province produces most of its iron ore?
When did the United Kingdom gain control of Labrador?
Why did the United Kingdom give Newfoundland a Commission of Government in 1934?
What are Newfoundland and Labrador's only three cities?
What is the province's longest river? Its largest lake?

Newfoundland dog, *NOO fuhnd LAND,* is one of the largest and strongest breeds of dog. Male Newfoundlands weigh about 140 pounds (64 kilograms) and stand about 28 inches (71 centimeters) high at the shoulder. Females are slightly smaller. Newfoundlands have a thick coat that protects against all types of weather. The most common color is black, often with a patch of white on the chest, chin, or toes. These dogs also may be gray, brown, or white with black markings.

No one knows exactly when the Newfoundland was developed. The breed was used for heavy work, both on land and in water. Early steamships and sailing vessels frequently included a Newfoundland as a crew member. These dogs are still known for their work in the water and their tendency to help swimmers in distress.

Newfoundlands are eventempered, intelligent, and confident. Their patience, playfulness, and protectiveness make them excellent companions for children.

Newgate Prison, a London jail, was England's main criminal prison for over 700 years. It was torn down in 1902, after years of protest about its shameful condition. The prison originally was part of London's West Gate, an entranceway to the city. West Gate was rebuilt and renamed Newgate in the 1100's. Prisoners were held in a room above the entranceway. Newgate was rebuilt again about 1423. But the Great Fire of London damaged it in 1666, and its condition grew steadily worse. Many prisoners died because of overcrowded rooms, poor food, and such contagious diseases as *jail fever* (typhus). Women, children, and debtors lived with hardened criminals. Few reforms were adopted until the 1800's. After 1815, debtors were held elsewhere. After 1847, only people awaiting trial were kept at Newgate.

Vernon F. Snow

Newman, Barnett (1905-1970), an American painter, was a leading member of the Abstract Expressionist movement. Newman developed an extremely simple style. Most of his works consist of a large vertical stripe on a background of one intense color. Newman used exceptionally large surfaces to induce viewers to scan his paintings extensively and thereby sense their vast scale and spacious, uncluttered vision. He believed that the abstract nature of his paintings gave them philosophical and spiritual meaning.

Newman began to paint in his simplified style in 1949. His works became highly controversial and were often attacked during the 1950's. However, his style had a strong impact on many painters of the 1960's and 1970's.

Newman helped establish the principles of Minimal Art, an American style that rejected emotion and subject matter in painting and emphasized color and form. His use of large areas of color also influenced a movement called Color-Field Painting. Newman was born in New York City. Dore Ashton

Newman, John Henry (1801-1890), became a convert to the Roman Catholic Church in 1845 and was made a cardinal in 1879. Before his conversion, he had distinguished himself as a scholar and a preacher of the Church of England at Oxford University. In 1833, he joined the movement within that church to rid it of political domination and to ground it more firmly in traditional beliefs (see **Oxford Movement**). The movement helped strengthen the established church, but Newman shocked his fellow reformers when he joined the Roman Catholic Church. In 1846, he became a Catholic priest.

Newman was born in London. For most of his life as a Catholic, he lived in Birmingham as rector of an *Oratory,* a group of men devoted to prayer and studies. He was considered one of the great thinkers of the 1800's. His autobiography, the *Apologia pro Vita Sua* (1864), was an answer to an attack upon him by Charles Kingsley, an Anglican minister and author. Among Cardinal Newman's many lectures is "The Idea of a University" (1852). *The Grammar of Assent* (1870) was his answer to religious skepticism. Newman also wrote the words of the hymn "Lead, Kindly Light." Peter W. Williams

Newman, Paul (1925-), an American actor, won fame for his action roles and convincing character studies in motion pictures. He portrayed outsiders or rebels in many of his films. Newman won the 1986 Academy Award as best actor for his performance in *The Color of Money.*

Newman was born in Cleveland and studied acting at Kenyon College, Yale University, and the Actors Studio. He made his Broadway debut in *Picnic* (1953) after appearing in several television dramas. Newman's first movie was *The Silver Chalice* (1955). He gained stardom in *Somebody Up There Likes Me* (1957). Newman's other films include *The Hustler* (1961), *Hud* (1963), *Harper* (1966), *Hombre* (1967), *Cool Hand Luke* (1967), *Butch Cassidy and the Sundance Kid* (1969), *The Sting* (1973), *Slap Shot* (1977), *Absence of Malice* (1981), *The Verdict* (1982), *Blaze* (1989), *Mr. and Mrs. Bridge* (1990), and *Twilight* (1998). He also starred on Broadway in *Sweet Bird of Youth* (1959). Newman directed *Rachel, Rachel* (1968), *The Effect of Gamma Rays on Man-in-the-Moon Marigolds* (1972), and *The Glass Menagerie* (1987). All three starred his wife, Academy Award winner Joanne Woodward. Louis Giannetti

Paul Newman

Newport, Rhode Island (pop. 26,475), is best known as a summer resort. The city lies on Narragansett Bay (see **Rhode Island** [political map]). Today, Newport is also a tourist and convention center. Its attractions include more than 300 buildings from colonial days. One of them, the Colony House, was built in 1739 and served as one of Rhode Island's capitols until 1900. Another historic landmark is the Touro Synagogue. Built in 1763, it is the oldest Jewish house of worship in the United States. The city hosts the annual Newport Music Festival.

Newport was founded in 1639 by nine families from the Massachusetts Bay Colony who sought religious freedom. Before the Revolutionary War in America (1775-1783), Newport rivaled Boston and New York City as a shipping center. The city won fame in the late 1800's as the summer home of wealthy railroad and banking families. Newport is the home of the Naval War College and Salve Regina University. It has a council-manager government. Stanford E. Demars

See also **Rhode Island** (Places to visit; pictures).

Newport News (pop. 180,150) is a shipbuilding center in eastern Virginia. It lies on the north shore of the harbor called Hampton Roads. See **Hampton Roads; Virginia** (political map). Newport News is part of a metropolitan area that includes Norfolk and Virginia Beach. The area has a population of 1,569,541.

Newport News Shipbuilding is Virginia's largest private employer. It operates one of the largest privately owned shipyards in the world. The city of Newport News is a large coal-exporting center. Other industries include seafood processing and the manufacture of automotive parts, electronic components, escalators, laser printers, and photocopiers. Newport News is the home of The Mariners' Museum.

Newport News was named for Captain Christopher Newport, who led a group of colonists to Jamestown, Virginia, in 1607. He reportedly brought news that more colonists were on the way. Although settlement began in Newport News around 1620, the area did not develop as a city until the railroad arrived in 1881. Newport News merged with Warwick and took over Warwick County in 1958. It has a council-manager form of government.

Susan L. Woodward

News media. See **Journalism.**

News service is an organization that collects and distributes news. Many newspapers and television and radio stations rely on news services for national and international news. Few papers and stations can afford their own national and foreign correspondents. News services developed from organizations set up in Europe during the 1820's and 1830's to provide economic news to private clients. News services were once known as *wire services* because they sent their reports by wire to printing devices called teletypewriters.

News services have reporters stationed in major cities throughout the world. These companies transmit the news gathered by their reporters and others to newspapers and other news organizations that pay for this service. The news text and photographs are sent by satellite or wire. Television and radio stations also subscribe to news services for news summaries written to be broadcast by local announcers.

In the United States, news services provide most of the foreign and national news reported by the press. All subscribers to a service receive the same national and international stories. In addition, each subscriber gets regional news, weather, and sports items. The major news services include the Associated Press (AP) and United Press International (UPI) of the United States, Reuters of the United Kingdom, ITAR of Russia (called ITAR-TASS in its bureaus outside of Russia), Agence France-Presse of France, and Xinhua of China.

Some large newspaper groups with their own staff of national and foreign correspondents operate a form of news service that is sometimes called a *news syndicate.* These papers sell subscribers stories that appear in the publications themselves. Other news services, called *feature syndicates,* provide a variety of materials, including columns of health advice, humor, and political opinion; editorial cartoons; and crossword puzzles.

Television news services furnish visual world coverage for televised news. These companies send newscasts and filmed or taped segments of news events to member television stations. Maurine H. Beasley

The newsroom of a daily newspaper hums with activity as the editorial staff hurries to prepare stories on the day's events and issues. Reporters and editors work on computers joined in a network, enabling them to pass stories along in electronic form so that all may complete their tasks.

Newspaper

Newspaper is a publication devoted chiefly to presenting and commenting on the news. Newspapers provide an excellent means of keeping well informed on current events. They also play a vital role in shaping public opinion.

Newspapers have certain advantages over the other major news media—television, radio, and newsmagazines. For example, newspapers can cover more news—and in much greater detail—than can television and radio newscasts. Newsmagazines focus on chief national and international events. But newspapers report local as well as national and international news.

A large daily newspaper provides a great variety of information. News stories cover the latest developments in such fields as government, politics, sports, science, business, and the arts. Other news stories report crimes, disasters, and special events of human interest. Editorials and columns of opinion often comment on controversial issues. Informative feature articles examine a wide range of subjects, including psychology, fashion, health, and child care. Most daily papers also carry comic strips, advice columns, and other entertainment items.

Producing a daily newspaper requires great speed and efficiency. Reporters, editors, and photographers work under the constant pressure of deadlines. A large daily newspaper also employs many other workers, including advertising salespeople, artists, librarians, printing-press operators, and truckdrivers.

This article describes the kinds, organization, production, and business operations of newspapers in the United States. It then discusses newspapers in other countries and traces the history of newspapers. For information on major issues in U.S. journalism, see the article **Journalism.**

Robert K. Stewart, the contributor of this article, is Professor of Journalism in the E. W. Scripps School of Journalism at Ohio University.

Kinds of newspapers

Newspapers are printed on coarse paper called *newsprint.* There are two major sizes of newspapers—*standard* and tabloid. A standard-sized newspaper in the United States has pages that measure about 13 by 21 $\frac{1}{2}$ inches (33 by 55 centimeters). The pages of a tabloid are about 9 $\frac{3}{4}$ by 14 $\frac{3}{8}$ inches (25 by 37 centimeters).

The standard and tabloid sizes are both used in publishing all printed newspapers. The three main kinds of printed papers are (1) daily newspapers, (2) weekly newspapers, and (3) special-interest newspapers. In addition, many newspaper publishers maintain *online newspapers,* which provide news information that computer users can access via the Internet.

Daily newspapers print world, national, state, and local news. They also carry editorials, opinion columns, feature articles, and entertainment items. Big-city dailies print many stories on social and political issues, such as the quality of schools and the efficiency of government. Many metropolitan papers include a section of suburban news several times a week. Some dailies are distrib uted in the evening, and others are morning papers. Some daily papers in large cities publish both a morning edition and an evening edition. Only a few large cities have more than one daily newspaper. The United States has about 1,500 daily newspapers. The total circu lation of U.S. dailies is about 60 million copies. The largest dailies sell more than a million copies.

Additional features and more advertising make Sunday newspapers much larger than weekday editions. Numerous Sunday papers have special sections on suc

topics as entertainment, finance, and travel. Many also include a Sunday magazine, a guide to television programs, and comics in color.

In the United States, most daily newspapers chiefly serve a particular metropolitan area or local region. Many other countries, however, have newspapers with a national circulation. In these countries, most governmental decisions are made on the national level. However, in the United States, many governmental decisions are made locally. Largely for that reason, there are few national newspapers in the United States. Instead, the country has many small newspapers that report local happenings.

In the United States, *The Christian Science Monitor, The New York Times, USA Today,* and *The Wall Street Journal* circulate nationally, but mostly in urban areas. Other notable U.S. dailies include *The Boston Globe,* the *Chicago Tribune, The Dallas Morning News, The Detroit News,* the *Los Angeles Times, The Miami Herald,* the *New York Daily News, The Philadelphia Inquirer,* the *St. Louis Post-Dispatch,* and *The Washington Post.*

Weekly newspapers, in general, serve much smaller areas than daily papers and publish news of a more personal nature. In small communities, many people know one another and take great interest in the activities of their friends and neighbors. Weddings, births, and deaths are major news items. A fire or traffic accident gets front-page coverage in a weekly newspaper. Weeklies also report news of local business and politics. Most weekly newspapers do not carry state, national, or world news. The United States has about 7,600 weekly newspapers.

Special-interest newspapers print news of concern to particular groups. Many business associations and labor unions publish newspapers for their members. Newspapers printed in foreign languages serve foreign-born residents in big cities. Some newspapers specialize in news about African Americans, Asian Americans, Hispanics, and other ethnic groups. Special-interest papers may also focus on specific topics, such as sports or the arts. Many high schools and most colleges also have a newspaper of their own.

Online newspapers are not distributed in printed form. Instead, they are produced as collections of information found at electronic addresses called *Web sites* on the World Wide Web, a system of computer files linked together on the Internet. Many newspapers, especially dailies, produce an online version in addition to a printed version. Some online newspapers include many of the same news stories and features that appear in the printed version. Others include expanded articles, additional commentary on news stories, and features that do not appear in their printed version, primarily because of space limitations. The online versions of some major papers have certain information that is available only by subscription, for which a computer user pays a fee. The user must enter a password to gain access to the information.

The staff of a newspaper

The number of people needed to produce a newspaper varies widely. The smallest weekly papers have only 1 to 3 workers, who do everything from writing the news, to selling ads, to running the press. Some larger weeklies employ 10 to 30 people. The largest metropolitan dailies have 2,000 or more employees.

The staff of most dailies is headed by the publisher, who directs all the departments. The staff of such a paper is divided into three main departments: (1) editorial, (2) business, and (3) mechanical.

The editorial department is responsible for the news and features that the paper prints. The head of the department is called the editor in chief, executive editor, or simply editor. This individual must have a thorough knowledge of all phases of newspaper work and know how to deal well with people.

© Pam Roberts, *Ely Echo*

Staff members of a small weekly newspaper generally perform a greater variety of tasks than their counterparts at a large daily newspaper. A staff of only a few people must do all the work, from gathering and writing the news to printing the paper. These editors are checking the facts in a story.

A managing editor helps the editor in chief direct the members of the editorial staff. Under the managing editor are assistant managing editors and news editors. Other editors have charge of news in certain areas. For example, most large dailies have a city editor, a suburban editor, a national editor, a feature editor, and an international editor. Each of the various sections and departments of the paper, such as the sports, arts, and financial sections, also has its own editor. Each editor supervises a staff of reporters, writers, and other workers. Some editors, such as the sports and financial editors, may write a daily column in addition to their supervisory duties. An art director works with the editors in planning the illustrations and photographs to accompany stories. The art director oversees a staff of artists and photographers.

The editor in chief directs the news staff and editorial writers. In many cases, the publisher helps guide these writers. For that reason, a newspaper's editorials often express the views of the publisher. Metropolitan dailies also employ special columnists to write columns of humor, advice, or general information.

Many newspapers provide special facilities to assist the editorial staff. For example, a library keeps copies of past stories and pictures plus such resources as almanacs and encyclopedias. The library also has computers for searching national and international databases. In addition, artists need special facilities to do their work. Some newspapers have a lab where photographic film can be developed quickly.

The business department tries to ensure that the paper makes a profit. A business manager heads the department with the help of an advertising manager, a circulation manager, and a promotion manager. The advertising manager directs a staff that sells advertising space to stores, manufacturers, and other businesses as well as classified ads to individuals and firms. The circulation manager supervises the distribution of the newspaper. The promotion manager develops ways of drawing attention to the paper to attract new readers and advertisers. The business department also has accountants and bookkeepers to handle the financial records.

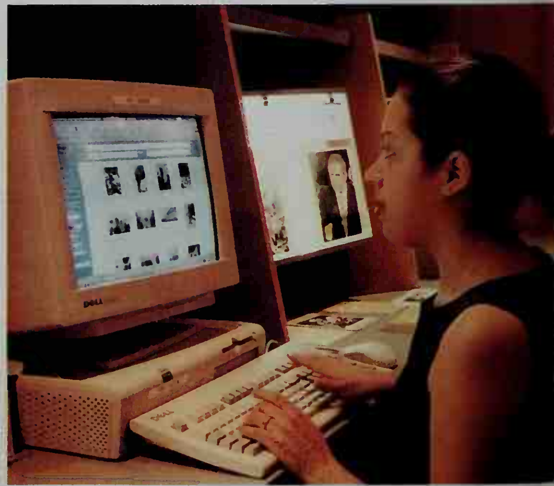
The mechanical department prints the newspaper. A production manager directs the department's operations. Some workers create layouts of pages, and others set the type. Still other workers produce the printing plates from which the newspaper is printed. The printing-press operators lock the plates on the presses and print the papers. Mailroom personnel assemble the papers and turn them over to the circulation department.

How newspapers are produced

Gathering information is the first step in the production of the news in a newspaper. A paper gets the news it prints from two main sources: (1) its own reporters and (2) news services.

Reporters use interviews, research, and investigative techniques to gather information for their stories. They must have well-developed news judgment to sort out important stories from those with little public interest.

A newspaper employs several kinds of reporters. Many reporters cover a specialty called a *beat.* Some beat reporters are assigned to particular locations, including city hall, police headquarters, and the criminal courts. Other beat reporters cover a particular subject, such as science, religion, education, or consumer affairs. Certain other reporters, called *general assignment reporters,* cover any story to which they are assigned or which they find on their own.



The news staff of a big-city newspaper also includes *investigative reporters* and *stringers.* Investigative reporters search out and expose political corruption or other wrongdoing. They may work weeks or months to get a story or a series of stories. Stringers do not work full time for the newspaper, but they occasionally write a story for it. Many stringers for big-city newspapers have a regular job with a suburban newspaper, a regional magazine, or a small radio station.

Many metropolitan papers have a staff of reporters in the state capital and in Washington, D.C. The largest pa-

Interviews help newspaper reporters gather information for their stories. A reporter carefully prepares interview questions to gain the information that is of most interest to the readers.

AP/Wide World

News services supply newspapers with stories and pictures electronically. This photo researcher is looking for particular types of images in a news service's archive of photographs.

pers also have foreign correspondents in such cities as London, Paris, Moscow, and Tokyo.

News services. Not even the largest newspapers can afford to have reporters in all the major cities of the United States and the world. As a result, newspapers depend on news services for at least part of their national and international news. The chief U.S. news services are the Associated Press (AP) and United Press International (UPI). Each of these services has reporters throughout the United States and throughout the world. Major news services in other countries include Agence France-Presse in France, Reuters in the United Kingdom, and ITAR in Russia (called ITAR-TASS in its bureaus outside Russia). News services were formerly known as *wire services* because they sent their stories by wire to printing devices called teletypewriters. Today, satellites are widely used to relay stories and photographs.

Many papers also get news from *news syndicates.* A news syndicate is owned by a newspaper or chain of newspapers with a large staff of reporters worldwide.

Newspapers also receive many press releases from private companies and government departments. An organization's press release sometimes leads to major news coverage of the event it describes.

Writing and editing stories. In writing a news story, reporters begin by giving the important facts in the first paragraph, which is called the *lead.* They then present details in the rest of the space given to the story by the city editor or news editor. The completed story goes to a copy editor, or copyreader, who checks it for accuracy and writes a headline for it. The copy editor may change the wording to make the story more readable. The copy editor must also cut material if the story is too long. A proofreader checks the story for spelling and punctuation errors.

Most reporters and editors prepare their stories on computers that have word processing software. The computers are linked in a network so that several individuals can use their own computers to perform successive writing and editing operations on a single story.

Many stories are accompanied by photographs, charts, or illustrations. Some photos, especially those of major news events, come from news services. They may be received over telephone lines or by satellite. Most newspapers also have a staff of photographers who take pictures of local events. Graphic artists usually design charts and illustrations on computers.

Writing editorials and features. A newspaper's editorial writers hold meetings to select topics for editorials. They also decide what viewpoint to take in the editorials. Unlike a news story, an editorial expresses an opinion and tries to sway readers to that way of thinking.

Feature writers prepare stories on subjects they think would interest the newspaper's readers. Common types of feature articles include interviews with famous entertainers, stories on unusual organizations, and descriptions of places to visit. Newspapers also get feature material from *feature syndicates,* which resemble news syndicates. Feature syndicates provide such items as political cartoons, comic strips, crossword puzzles, and columns on chess, gardening, and financial matters.

Preparing advertisements. Newspapers carry two forms of advertising—*display ads* and *classified ads.* Most display ads include illustrations and may be as large as two pages. Some metropolitan newspapers add booklets of display ads, called *inserts,* to the newspaper. Many newspapers have a staff of graphic artists to help prepare display ads. Classified ads, also called *want ads,* usually appear in a separate section of the newspaper. Most consist of a few lines of print and advertise such things as used cars or apartments for rent.

Making up the pages. Artists prepare a *layout,* or sketch, of each newspaper page. A layout shows where the stories, pictures, and advertisements should appear on the page. Most newspapers use computers to create layouts. Computer layouts enable artists to make precise measurements and to rearrange page contents quickly.

Many newspapers also assemble the pages by computer. Workers merge two kinds of files, following the layouts: (1) text files, and (2) graphics files. Text files consist of the words in stories, advertising copy, and other material. Graphics files are digital representations of photographs and other illustrations. Some graphics are photographed with digital cameras or are received as computer data from outside sources. Photographs shot on film and illustrations drawn on paper are converted to digital form using an electronic device called a *scanner.* Workers using a computer to assemble a page can see exactly where the text and the illustrations, which are represented by boxes called *windows,* will appear on the page.

An older method of making up pages uses images of illustrations and individual columns of type on paper. A special machine coats the back of the paper with wax, which makes the paper stick to plastic. Using the layouts as a guide, workers prepare a *paste-up* by attaching the pieces of paper for one or two pages to a large plastic sheet.

When pages are produced and assembled on a computer, any of several methods may be used to produce printing plates. In one method, called *computer-to-plate* or *direct-to-plate,* the digital files representing the pages are transmitted electronically to an imagesetting or platesetting device, which produces the printing plates. In another method, the page is printed out on a computer printer. The text and graphics appear where the worker positioned the windows. The printed page may then be photographed to produce a negative. Or the page

Newspaper terms

Banner is the top headline on page 1.
Beat is a news field to which a reporter is regularly assigned, such as city hall or consumer affairs.
By-line is the name of the writer of a news story, feature article, or special column. In most cases, it appears just beneath the headline.
Copy means the manuscript of any news matter prepared for typesetting.
Dateline refers to the line at the beginning of a news story that tells where and, in some cases, when the story originated.
Edition means any issue of the newspaper. Large newspapers issue several editions during the day or night.
Lead is the opening paragraph of a news story. In most cases, it summarizes the important information in the story.
Masthead includes the title of the newspaper and the names of the publisher and principal editors. In most cases, it appears on the editorial page.
Subhead is a short heading used to break up the paragraphs of a long news story.

How a newspaper is produced

The pictures on this page show some of the steps commonly used in producing newspapers and preparing them for shipment. Some publishers use different methods for laying out pages.

© Gannett Company Inc.

Writing a story. A reporter gathers information by doing research and performing interviews. The writer then uses a computer with word-processing software to prepare the story.

Walter P. Calahan Photography for *USA Today*

Assembling a page. With the aid of a computer, a worker lays out the stories and the other elements of the page. The layout can be transmitted electronically to a laser platesetter.

© Pam Roberts, *Ely Echo*

Mounting the printing plate. A worker wraps the printing plate around a cylinder on the printing press. The plate is made so that ink will adhere only to the image areas.

Uniphoto

Printing a newspaper. A newspaper is printed by *offset lithography.* Ink transfers from the printing plates to *rubber blanket cylinders* and then to a long roll of paper.

Walter P. Calahan Photography for *USA Today*

Producing individual newspapers. Special equipment cuts sections from the printed roll and folds them to make individual newspapers. The papers are ready to be bundled for shipment.

Walter P. Calahan Photography for *USA Today*

Shipping the newspapers. Most of the papers are bundled and sent to a loading dock. Workers put the papers on trucks, which deliver them to newsstands and distribution centers.

image can be transferred onto light-sensitive paper or film that will then be transferred to a printing plate. For certain applications, a negative is produced with the graphics windows taking the place of the illustrations. A worker then cuts away the paper or plastic from the image areas, and inserts negatives of the graphics. When pages are assembled via the paste-up method, workers photograph the sheets to make negatives of the pages.

Printing the newspaper. Most newspapers use a printing method called *offset lithography.* In *offset,* as it is usually called, the image to be printed is on the same level of the printing plate as the areas that do not print. Offset is done on *rotary presses,* which have cylinders that hold curved printing plates. The plate does not come into contact with the paper. Instead, the printed images are transferred—that is, offset—to a rubber "blanket" cylinder that then prints them on the paper.

In one common method of producing a plate, the negative of a page is placed on a thin metal or plastic plate with a light-sensitive coating and exposed to bright light. The light passes through the transparent (image) parts of the negative and hardens the coating under these parts. The other parts of the negative block the light, and the coating under them remains soft. Workers treat the plate with a solution of developer and lacquer. The lacquer adheres only to the hardened image areas. The plate is washed, and a gum is applied to thoroughly cleanse the nonimage areas so they will repel any ink. During printing, only the lacquered areas accept ink. For more information on the production of plates, see **Photoengraving and photolithography.**

Printers mount the plates on the rotary press. After all the plates have been made and are mounted on the press, the press goes into action. In the most commonly used kind of press, a large *web* (roll) of paper is drawn between the blanket cylinders, receiving the print images of all the plates. The printed pages are transferred to a machine that cuts the sheets and folds them into pages. Other machines place the different sections of the paper together and stack the newspapers into piles.

Some newspapers are printed by methods other than offset. For more information on printing, see **Printing** (Methods of printing).

Business operations

Newspapers in the United States earn about three-fourths of their income from the sale of advertising. Most newspapers get the rest of their income from sales of the paper. The syndication of news stories or features provides additional revenue for some large papers. A newspaper's advertising department handles the sale of ads, and the circulation department manages the distribution and sales of the newspaper. Some special-interest newspapers are circulated without charge and earn all their income from advertising.

Advertising fills about half of the space in U.S. newspapers. Papers sell most of this space to local businesses and individuals. National firms buy the rest.

The advertising manager of a large newspaper directs division supervisors. The division supervisors have charge of various kinds of advertising, such as advertising for automobile dealers, department stores, and supermarkets. Each division supervisor has a staff of sales representatives who sell ads to businesses. Workers in the classified-ad department sell ads over the telephone. They also help people write their want ads. People may also purchase ads through a newspaper's Web site. In addition to the local advertising staff, many newspapers have sales representatives in other cities.

Janet Heintz, *Chicago Tribune*

A newspaper display advertisement is inserted on a page electronically. An advertising agency prepared the ad and handled the purchase of the newspaper space for it.

Circulation. Newspaper distribution is a complex operation. After the papers are printed and assembled, conveyor belts carry them to the mailroom. Most of the papers are grouped into bundles with plastic strapping. The rest are addressed for mailing. The bundles travel on chutes to a loading dock, where trucks wait to haul them to newsstands and distribution centers.

National newspapers are printed simultaneously throughout the country. Communications satellites relay images of the newspaper pages to printing plants in major cities. Some large metropolitan papers have a central plant as well as plants in outlying areas that print the paper from satellite images.

The circulation manager oversees the distribution of papers and works with the promotion manager to try to increase the number of readers. Supervisors of city sales, suburban sales, and home delivery work under the circulation manager. District circulation supervisors look after sales in various areas of the city or suburbs. Independent newspaper carriers also make up an important part of the distribution system. They pick up papers at distribution centers and deliver them to homes in the city and suburbs.

Newspapers in other countries

Newspapers in most countries have far fewer pages than do those in the United States. Many papers in other countries have no more than 8 or 10 pages. They devote more of their stories to political and governmental affairs, and they have fewer ads and features.

Norway leads the world in newspaper readership with about 700 copies sold daily for every 1,000 people.

Other countries with exceptionally high newspaper readership include Japan, Finland, and Sweden. Circulation in the United States averages about 200 copies for every 1,000 people. In general, circulations are large in industrialized nations. Poverty and illiteracy restrict readership in developing countries. Many publishers in industrialized countries maintain online versions of their daily newspapers.

In most nations, the government controls to some extent what newspapers may publish. Governmental control of the news media is strongest in Communist nations. In these nations, the government owns and operates the media. Many countries in Africa, Asia, and Latin America severely restrict press freedom. In these countries, the government controls the press through censorship or through laws that make it dangerous to criticize the government. Only a small minority of nations allow newspapers to print any news they wish. Freedom of the press exists mainly in English-speaking nations, in most of the countries of Western Europe, and in Israel and Japan. See **Freedom of the press**.

In Canada, newspapers are similar to U.S. papers in size and content. Canada has about 120 daily newspapers and more than 800 weekly papers. Two newspaper chains—Southam Newspapers and Thomson Newspapers—own about half the nation's dailies and control about half the daily circulation.

The leading English-language dailies include *The Gazette* of Montreal and two Toronto papers—*The Toronto Star* and *The Globe and Mail. La Journal de Montréal* is Canada's largest French-language daily.

In Europe, the United Kingdom's papers most closely resemble those of the United States and Canada. All the largest British newspapers have their main offices in London and are distributed nationally. They include the country's most influential papers, *The Times, The Guardian, The Independent,* the *Daily Telegraph,* and the *Financial Times.* The British papers with the highest circulations include the *Daily Mail,* the *Daily Mirror* and *The Sun.*

Before World War II (1939-1945), most newspapers in France were associated with some political party or special-interest group. Each of these papers wrote its news from a particular political viewpoint. Today, the Communist paper *L'Humanité* is the only party paper with a wide circulation in France. Other French papers have political leanings, but they report news from a basically neutral point of view. Some French newspapers, such as the Paris papers *Le Figaro* and *Le Monde,* provide excellent coverage of the arts. Other French newspapers that are widely circulated include *La Croix, France-Soir,* and *Le Parisien Libéré.* All of these newspapers are published in Paris.

Newspaper circulation is generally smaller in Russia than in most European countries. Russia's leading daily newspapers are *Komsomolskaya Pravda* and *Trud.* Other large dailies include *Moskovsky Komsomolets* and *Izvestia.*

In Germany, the daily with the highest circulation is *Bild Zeitung* of Hamburg. It is printed in 15 of Germany's 16 states and has a circulation of about 5 million. Outstanding German newspapers include the *Frankfurter Allgemeine Zeitung* of Frankfurt (am Main), *Süddeutsche Zeitung* of Munich, *Die Welt* of Bonn, and *Berliner Zeitung of Berlin.* Italy's leading papers include *La Stampa* of Turin, *La Repubblica* of Rome, and *Il Giorno* and *Corriere della Sera* of Milan.

In Africa and the Middle East, the governments of most nations maintain tight control over what appears in the press. Israel and South Africa have a free press. But the governments of both countries exercise control over certain types of information, such as military news. Most Arab countries have laws that allow government officials to censor news before publication. In Egypt, the government owns all the newspapers, including *Al Ahram* of Cairo, the Arab world's most influential paper.

In Latin America, government control of the press is common. Some Latin American nations officially restrict what newspapers may print. Certain others practice indirect forms of censorship. For example, the government may own the nation's paper supplies. In that case, a newspaper that criticizes government leaders may find it difficult to buy newsprint. Major Latin American newspapers include *La Prensa* and *La Nación* of Buenos Aires, Argentina; *O Estado de São Paulo* of São Paulo, Brazil; and *Excélsior* of Mexico City, Mexico.

In Asia, Japan and China have the most highly developed press systems. Japan's leading dailies—*Asahi Shimbun, Mainichi Shimbun,* and *Yomiuri Shimbun*—circulate nationally. Each publishes a Tokyo edition and several regional editions. *Yomiuri Shimbun* has the largest circulation of any paper in the world—more than 14 million copies per day. One of China's largest newspapers is *Renmin Ribao (People's Daily)* of Beijing, the official paper of the Chinese Communist Party.

In Australia and New Zealand, newspapers resemble those of the United States and Canada. Major dailies in Australia include *The Daily Telegraph-Mirror* and *The Sydney Morning Herald,* both of Sydney, and the *Herald-Sun* and *The Age,* both of Melbourne. New Zealand's leading daily is *The New Zealand Herald,* published in Auckland.

History

Handwritten newssheets posted in public places probably were the first newspapers. The earliest known daily newssheet was *Acta Diurna (Daily Events),* which started in Rome in 59 B.C. The world's first printed newspaper was a Chinese circular called *Dibao,* also spelled *Ti-pao.* The Chinese began printing *Dibao* from carved wooden blocks around A.D. 700. The first regularly published newspaper in Europe, *Avisa Relation oder Zeitung,* started in Germany in 1609.

Development of U.S. newspapers. In 1690, Benjamin Harris of Boston founded *Publick Occurrences Both Forreign and Domestick,* the first newspaper in the American Colonies. However, the colonial government ordered it stopped after one issue. In 1704, John Campbell established *The Boston News-Letter,* the colonies' first regularly published newspaper. By 1765, the colonies had more than 20 newspapers.

Newspapers in the United States developed rapidly in the 1800's. By 1830, the country had about 1,000 papers. However, they were available only by subscription, and they cost about 6 cents a copy, which was more than working-class people could afford. Then in 1833, Benjamin H. Day started the *New York Sun,* the first of many successful penny newspapers. In the late 1800's, papers

tried to outdo one another with sensational reports of crimes, disasters, and scandals. The most sensational newspapers included two New York City dailies— William Randolph Hearst's *Journal* and Joseph Pulitzer's *World.* Edward Wyllis Scripps established the first newspaper chain during the late 1800's. The number of U.S. newspapers peaked in 1909, when the country had about 2,600 dailies and about 14,000 weeklies. For more on the early history of U.S. newspapers, see **Journalism** (History).

Recent trends. High operating expenses, especially the rising cost of labor and newsprint, have driven many U.S. newspapers out of business. Few cities have competing dailies. In some cities with competing dailies, rival publishers print their papers on the same presses to reduce costs. Financial problems have hit hardest at major metropolitan papers, which face special distribution problems plus increasing competition from suburban papers, TV newscasts, and the Internet. Some big-city papers began publishing a second daily edition in an effort to gain wider readership.

Since the 1960's, newspaper chains have bought up papers at an especially rapid rate. Today, the 10 largest chains account for more than half of the total daily circulation in the United States. More than 80 percent of all United States dailies belong to chains. The nation's largest chain is Gannett Company, Inc., which owns nearly 100 papers. Other major chains include Advance Publications, Inc.; Dow Jones & Company, Inc.; Knight-Ridder Inc.; The New York Times Company; and the Tribune Company.

Most newspapers today use computerized systems for laying out and assembling pages. Reporters can write stories on portable computers and then send the stories to the office via a computer network.

In 1980, *The Columbus* (Ohio) *Dispatch* became the first electronic newspaper in the United States. In addition to printing a regular edition, the paper began transmitting some of its editorial content to computers in the homes, businesses, and libraries of a small number of subscribers. Today, several papers offer online newspapers. Computer users can use the Internet to access news stories, classified ads, and other features. Some newspapers also distribute their pages via fax machines.

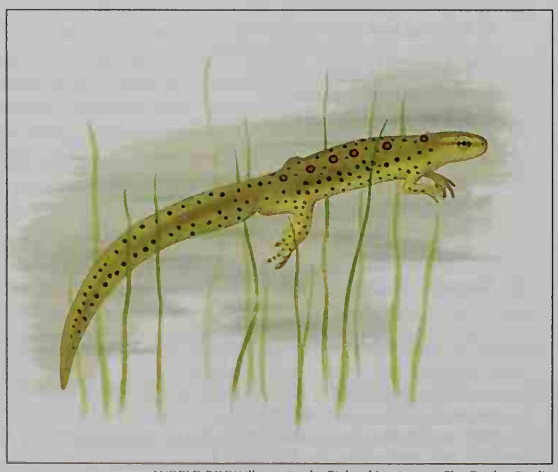
Newspaper Guild is a labor union whose members work in the news and commercial departments of newspapers, news magazines, news services, and related enterprises. The Newspaper Guild has local organizations in more than 100 cities in the United States, Canada, and Puerto Rico.

The guild has negotiated shorter hours, higher wages, severance pay, and greater job security for its members. It has contracts with newspapers whose combined circulation totals about one-fourth of the daily newspaper circulation in the United States.



The Newspaper Guild is affiliated with the AFL-CIO and the Canadian Labour Congress. The union was founded in 1933, and it was called the American Newspaper Guild until 1971. The Newspaper Guild's headquarters are in Silver Spring, Maryland.

Critically reviewed by the Newspaper Guild

Newsprint. See **Paper** (Special kinds of paper).

Newt, *noot,* is a small animal with a slender body, thin skin, and four weak legs. It is a type of salamander and is classified as an amphibian, along with frogs and caecilians (see **Amphibian**).

Newts and other salamanders are *tailed amphibians.* The tail of the adult newt is flatter than that of most other salamanders. Newts hatch from eggs that are laid singly in the spring on the leaves of plants underwater. The young hatch after three to five weeks. They live in the water and breathe by means of gills. In time, they develop lungs and may take to the land. People then call them *efts.* Efts are bright orange and are easily seen on the forest floor. They are seldom bothered by other animals because their skin is poisonous. The efts stay on land up to seven years before they return to water to breed. They often shed their skins. If an eft loses a leg, it can grow it back. The kind of newt best known in the United States is the *red-spotted* newt. It is about 4 inches (10 centimeters) long. Newts eat insects, worms, and mollusks. Don C. Forester

WORLD BOOK illustration by Richard Lewington, The Garden Studio

The red-spotted newt, the most common type of newt in the United States, is a small amphibian with a long tail.

Scientific classification. Newts are in the class Amphibia. They belong to the salamander family, Salamandridae. The red-spotted newt is *Notophthalmus viridescens.*

Newton, a unit in the metric system, is used to measure force. Its symbol is *N.* One newton is the force required to increase or decrease the velocity of a 1-kilogram object by 1 meter per second every second. The newton was named for the English scientist Sir Isaac Newton. The number of newtons needed to accelerate an object can be calculated by using the formula $F = ma$. The mass *(m)* of the object in kilograms is multiplied by the acceleration *(a)* in meters per second squared to determine the force *(F).*

Force is measured in pounds in the inch-pound system of measurement customarily used in the United States. One newton equals about 0.225 pound of force.

Hugh D. Young

See also **Pascal.**

Newton, Sir Isaac (1642-1727), was an English scientist, astronomer, and mathematician who invented a new kind of mathematics, discovered the secrets of light and color, and showed how the universe is held together. Newton is sometimes described as "one of the greatest names in the history of human thought" because of his great contributions to mathematics, physics, and astronomy.

Newton discovered how the universe is held together through his theory of gravitation. He discovered the secrets of light and color. He invented a branch of mathematics, *calculus,* also invented independently by Gottfried Leibniz, a German mathematician (see **Calculus**). Newton made these three discoveries within 18 months from 1665 to 1667.

The theories of motion and gravitation. Newton said the concept of a universal force came to him while he was alone in the country. He had been forced to flee there because of the outbreak of plague in the city of Cambridge. During this time, Newton suddenly realized that one and the same force pulls an object to Earth and keeps the moon in its orbit. He found that the force of universal gravitation makes every pair of bodies in the universe attract each other. The force depends on (1) the amount of matter in the bodies being attracted and (2) the distance between the bodies. The force by which Earth attracts or pulls a large rock is greater than the pull on a small pebble because the rock contains more matter. Earth's pull is called *the weight* of the body. With this theory, Newton explained why a rock weighs more than a pebble.

He also proved that many types of motion are due to one kind of force. He showed that the gravitational force of the sun keeps the planets in their orbits, just as the

gravitational force of the earth attracts the moon. The falling of objects on earth seems different from the motion of the moon because the objects fall straight down to the earth, while the moon moves approximately in a circle around the earth. Newton showed that the moon falls just like an object on earth. If the moon did not fall constantly toward the earth, it would move in a straight line and fly off at a tangent to its orbit. Newton calculated how much the moon falls in each second and found the distance is $\frac{1}{3600}$ of the distance an object on earth falls in a second. The moon is 60 times as far from the earth's center as such an object. Consequently, the force of the earth on an object 60 times as far away as another object is $\frac{1}{3600}$.

The Principia. Newton concluded his first investigations on gravity and motion in 1665 and 1666. Nothing was heard of them for nearly 20 years. His original theory had been based on an inaccurate measurement of the earth's radius, and Newton realized differences between the theory and the facts. Although he later learned the true value of the earth's size, he was not led to complete his investigation or to produce a book for publication.

One day in 1684, Edmond Halley, an English astronomer, Robert Hooke, an English scientist, and Christopher Wren, the architect, were discussing what law of force produced the visible motion of the planets around the sun. They could not solve this problem. Halley went to Cambridge to ask Newton about it. He found Newton in possession of complete proof of the law of gravity. Halley persuaded Newton to publish his findings. Halley paid all the expenses, corrected the proofs, and laid aside his own work to publish Newton's discoveries. Newton's discoveries on the laws of motion and theories of gravitation were published in 1687 in *Philosophiae Naturalis Principia Mathematica (Mathematical Principles of Natural Philosophy).* This work, usually called *Principia* or *Principia Mathematica,* is considered one of the greatest single contributions in the history of science. It includes Newton's laws of motion and theory of gravitation. It was the first book to contain a unified system of scientific principles explaining what happens on earth and in the heavens.

Light and color. Newton's discoveries in optics were equally spectacular. He published the results of his experiments and studies in *Opticks* (1704).

Newton's discoveries explained why bodies appear to be colored. The discoveries also laid the foundation for the science of spectrum analysis. This science allows us to determine the chemical composition, temperature, and even the speed of such hot, glowing bodies as a distant star or an object heated in a laboratory.

Newton discovered that sunlight is a mixture of light of all colors. He passed a beam of sunlight through a glass prism and studied the colors that were produced. A green sweater illuminated by sunlight looks green because it largely reflects the green light in the sun and absorbs most of the other colors. If the green sweater were lighted by a red light or any color light not containing green, it would not appear green.

The study of light led Newton to consider constructing a new type of telescope in which a reflecting mirror was used instead of a combination of lenses. Newton's first reflecting telescope was 6 inches (15 centimeters)

Oil painting on canvas (about 1726) by an unknown artist; National Portrait Gallery, London

Sir Isaac Newton was a famous English scientist.

A diagram by Newton shows what happens to a projectile that is launched from a great height and at different speeds.

Newton's discoveries in optics were revolutionary. By passing a beam of light through a prism, *above,* he showed that white light is made up of a rainbowlike band of colors.

WORLD BOOK illustrations by Robert Addison

A reflecting telescope designed by Newton, *left,* used a reflecting mirror instead of the traditional combination of lenses.

long, and, through it, Newton saw the satellites of Jupiter.

Early life. Newton was born at Woolsthorpe, Lincolnshire, on Dec. 25, 1642. He attended Grantham grammar school. As a boy, he was more interested in making mechanical devices than in studying. His youthful inventions included a small windmill that could grind wheat and corn, a water clock run by the force of dropping water, and a sundial. He left school when he was 14 to help his widowed mother manage her farm. But he spent so much time reading, he was sent back to school.

He entered Trinity College, Cambridge University, in 1661. He showed no exceptional ability during his college career and graduated in 1665 without any particular distinction. He returned to Cambridge as a fellow of Trinity College in 1667.

Newton became professor of mathematics at Cambridge in 1669. He lectured once a week on arithmetic, astronomy, geometry, optics, or other mathematical subjects. He was elected to the Royal Society in 1672.

Public life. Newton became active in public life after the publication of *Principia*. He became the Cambridge University member of Parliament in 1689 and held his seat until Parliament dissolved the following year. He became warden of the mint in 1696. He was appointed master of the mint in 1699, a position he held until his death.

In 1699, he also became a member of the Royal Society council and an associate of the French Academy. He was elected to Parliament again from the university in 1701. He left Cambridge and settled permanently in London in that same year. He became president of the Royal Society in 1703 and was reelected annually until his death. Queen Anne knighted Newton in 1705. He died in 1727 and was buried in Westminster Abbey.

Personal characteristics. Newton did not enjoy the scientific arguments that arose from his discoveries. Many new scientific theories are opposed violently when they are first announced, and Newton's did not escape criticism. He was so sensitive to such criticism that his friends had to plead with him to publish his most valuable discoveries.

Newton was a bachelor who spent only part of his time studying mathematics, physics, and astronomy. He was also a student of alchemy and made many alchemical experiments. He also spent a great deal of his time on questions of theology and Biblical chronology.

As a professor, he was very absent-minded. He showed great generosity to his nephews and nieces and to publishers and scientists who helped him in his work.

He was modest in his character. He said of himself shortly before his death, "I do not know what I may appear to the world, but to myself I seem to have been only like a boy playing on the seashore, and diverting myself in now and then finding a smoother pebble or a prettier shell than ordinary, whilst the great ocean of truth lay all undiscovered before me."

Albert Einstein, the German-born American physicist, rejected Newton's explanation of universal gravitation but not the fact of its operation. He said that his own work would have been impossible without Newton's discoveries. He also said that the concepts Newton developed "are even today still guiding our thinking in physics." Margaret C. Jacob

Newton's rings are a series of alternating bright and dark concentric circles produced by the interference of light (see **Interference**). They occur when two microscope slides are pressed tightly together at one point, or when a slightly convex piece of glass is placed on top of a flat piece of glass. Light reflected off the flat surface travels slightly farther than—and interferes with—light reflected off the curved surface. If viewed in strong white light, such as sunlight, the rings show the colors of the spectrum. If the viewing light is a single color, the rings have only that color. The rings were named for the English scientist Sir Isaac Newton, who first studied them in detail. David M. Roessler

David M. Roessler, General Motors Research Laboratories

Newton's rings, *shown here,* were created by pressing two microscope slides tightly together at one point.

Next of kin is a legal phrase for the closest blood relatives of a person who has died without making a valid will. These next of kin share in the personal property of the dead person. Each state's laws determine which relatives get the personal property left by a resident of that state who did not leave a will. Usually, such laws provide for the distribution of both real and personal property to the same people, thus treating next of kin the same as heirs (see **Heir**). The relatives sharing the property are called *next* of kin because they are generally the closest surviving relatives of the dead person. Thus, a dead person's children are favored over cousins in the distribution of property. William M. McGovern

Ney, *nay,* **Michel,** *mee SHEHL* (1769-1815), a French general, was one of Napoleon I's great soldiers. Ney was fiercely brave, but he was not effective as an independent commander.

Ney served with great distinction in the campaign of 1792, when the French Army of the North defeated the Prussians and Austrians. He soon distinguished himself

by his cool courage and military skill. Napoleon made him a marshal of France in 1804. Ney received the title Duke of Elchingen for defeating the Austrians at Elchingen in 1805. He fought at Jena and Eylau and commanded an army at Friedland, where the French defeated the Russians in 1807. His conduct at Friedland won him Napoleon's praise. He took charge of Napoleon's army for the march into Russia in 1812 and became Prince of Moscow. Napoleon left the army after its defeat and hastened back to France. But Ney remained with the Grand Army during the terrible retreat from Russia.

When Napoleon was forced from power in 1814, Ney abandoned him and became a supporter of King Louis XVIII, who succeeded Napoleon. But Napoleon escaped from Elba in 1815 and landed on the coast of France. Ney told King Louis that he would "bring Napoleon back in an iron cage," and started out with an army. He met Napoleon, who was marching toward Paris with a new army. But emotion swayed Ney. He embraced Napoleon, and joined him in the march on Paris. The king fled as the army approached, and Ney and Napoleon entered the capital together.

The period of Napoleon's return to power, called the *Hundred Days,* ended in his defeat. Ney led the last French charge at Waterloo in 1815. But he was seized, tried for treason and rebellion, and condemned to death. He was shot on Dec. 7, 1815. Ney was born in Saarlouis, in the Saar Basin in what is now Germany.

Nez Perce Indians, *nehz PURS,* are a tribe that lives in north-central Idaho. The rich farmlands and forests in the area form the basis for the tribe's chief industries—agriculture and lumber. Many Nez Perce also make a living by fishing, by hunting, and by gathering wild plants.

The name *Nez Perce* means *pierced nose,* but few of the Indians ever pierced their noses. In 1805, a French interpreter gave the name to the tribe after seeing some members wearing shells in their noses as decorations. The Indians kept the name, but they do not use the French form of the name, *Nez Percé* (pronounced *nay pehr SAY*).

The Nez Perce originally lived in the region where the borders of Idaho, Oregon, and Washington meet. Prospectors overran the Nez Perce reservation after discovering gold there in the 1860's.

Part of the tribe resisted the efforts of the government to move them to a smaller reservation. In 1877, fighting broke out between the Nez Perce and U.S. troops. Joseph, a Nez Perce chief, tried to lead a band of the Indians into Canada. But he surrendered near the United States-Canadian border.

Ngo Dinh Diem, *uhng oh dihn zih ehm* (1901-1963), was the first president of South Vietnam. He served from 1955 until a group of army officers seized control of the government and killed him in 1963.

Diem was born in central Vietnam, the son of a government official. In the late 1940's, he worked for Vietnam's independence from France and opposed Communist control of Vietnam. In 1954, Communist-led rebels defeated the French forces in Vietnam. The country was then divided into two parts, South Vietnam and North Vietnam. Bao Dai, emperor of South Vietnam, appointed Diem as his prime minister. Diem was elected president when South Vietnam became a republic in 1955.

At first, Diem restored some order to his war-torn country. But he soon began ruling like a dictator, and he became increasingly unpopular. Special police units brutally crushed his opponents. Also, Diem was unable to stop *Viet Cong* (Communist-led guerrilla) attacks on villages in South Vietnam. Many of his harsh actions were attributed to advice from his brother Ngo Dinh Nhu, and his sister-in-law, Madame Nhu. Nhu and Diem were killed together.

Niagara Falls is one of the most spectacular natural wonders of North America. It is on the Niagara River, about halfway between Lakes Erie and Ontario. The river forms part of the United States-Canadian border.

Niagara Falls actually consists of two waterfalls, the Horseshoe Falls and the American Falls. The Horseshoe Falls is on the Canadian side of the border in the province of Ontario. The American Falls is on the United States side in the state of New York. At night, wide beams of colored lights illuminate the falls. About 10 million people visit Niagara Falls annually.

Description. At the falls, the Niagara River plunges into a steep, canyonlike gorge. The gorge extends beyond Niagara Falls for about 7 miles (11 kilometers), to Lewiston, N.Y. The famous Whirlpool Rapids begin about 3 miles (5 kilometers) below the falls. Here, the violent current has carved a round basin out of the rocks.

WORLD BOOK map

Niagara Falls lies on the United States-Canadian border. It consists of the American Falls and the Horseshoe Falls on the Niagara River, about halfway between Lakes Erie and Ontario.

Frederick Lewis, Inc

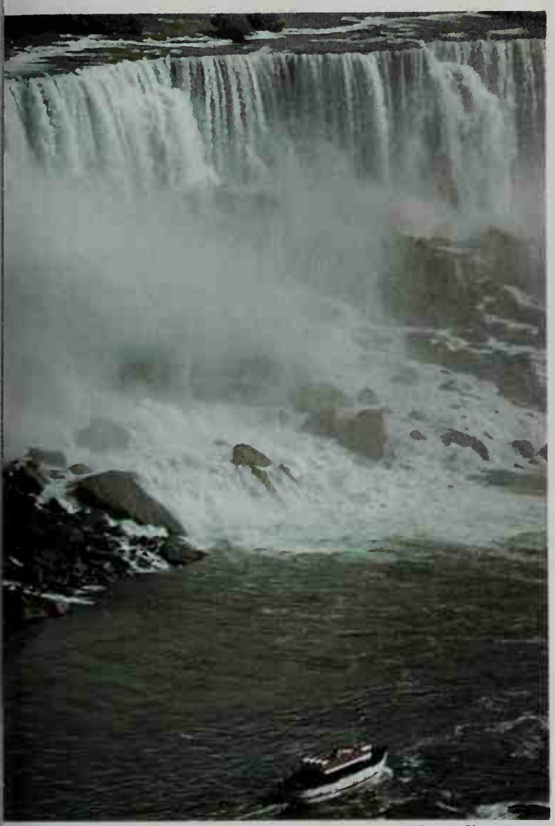
The spectacular waterfalls of the Niagara River attract millions of tourists annually. Parks with observation areas line both sides of the river where it splits and plunges into a steep gorge. Goat Island lies between the American Falls, *left,* and the Horseshoe Falls, *right.*

About 85 per cent of the water at Niagara Falls flows over the Horseshoe Falls. The Horseshoe Falls is about 167 feet (51 meters) high and 2,600 feet (792 meters) wide at its widest point. The American Falls is about 176 feet (54 meters) high and 1,000 feet (305 meters) wide.

The gorge is about 200 feet (61 meters) deep and consists of layers of different kinds of stone. A hard rock called *dolomite* about 80 feet (24 meters) thick forms the top layer. It covers softer layers of dolomite, limestone, sandstone, and shale. Water erodes soft stone faster than hard stone. For this reason, the top layer extends beyond the lower layers in many places. The Cave of the Winds, behind the American Falls, has been formed under an extended shelf of harder stone.

Through the years, the gorge has become longer and longer. The pounding water erodes the soft underlying rock layers, which causes the unsupported hard rock ledge to collapse. Niagara Falls was originally at Lewiston, but it has gradually moved about 7 miles (11 kilometers) back upstream toward Lake Erie. The ledge of the Horseshoe Falls wears away at a rate varying from about 3 inches (8 centimeters) to as much as 6 feet (2 meters) per year. The ledge of the American Falls erodes more slowly because less water flows over it. Each year, about 1 inch (2.5 centimeters) wears away.

Tourism. Niagara Falls attracts visitors throughout the year. However, most visitors come during the tourist season, from April 1 to October 31. Several steamers called *The Maid of the Mist* take sightseers close to the churning waters at the base of the falls. Parks line both sides of the river near Niagara Falls. Excellent views of the falls may be seen from such sites as Prospect Point, Table Rock, and Terrapin Point. Four observation towers, ranging from 282 to 500 feet (86 to 150 meters) high, also provide fine views of the falls.



Water flow. United States and Canadian hydroelectric plants divert some of the water through tunnels from the Niagara River before it reaches Niagara Falls (see **Niagara River** [Water power]). For scenic reasons, however, the amount of water that may be diverted is regulated by a treaty between the United States and Canada. The treaty states that at least 100,000 cubic feet (2,800 cubic meters) of water a second must pass over the falls during daylight hours of the tourist season. At other times, the flow may be decreased to 50,000 cubic feet (1,400 cubic meters) a second.

History. Niagara Falls was probably formed about 12,000 years ago, after the last great ice sheet melted from the region. The melting ice caused Lake Erie to overflow. The overflow formed the Niagara River. The river ran northward over a high cliff called the *Niagara Escarpment.* The Niagara River cut through the escarpment and, over the centuries, formed Niagara Falls.

Indian tribes lived in the area long before the first Europeans arrived. The name *Niagara* comes from the Iroquois word *Onguiaahra,* meaning *the strait.*

Louis Hennepin, a Roman Catholic priest who traveled with the French explorer Robert Cavelier, Sieur de La Salle, left the first written account of Niagara Falls. In a book published in 1683, Hennepin wrote: "These waters foam and boil in a fearful manner. They thunder continually."

Large numbers of tourists began visiting Niagara Falls during the 1800's. Many hotels and taverns were built on

Robert H. Glaze, Artstreet

A sightseeing boat, one of several steamers called *The Maid of the Mist,* gives visitors a close-up view of the foaming water and fallen rocks at the base of the American Falls.

the American and Canadian sides of the falls. In addition, numerous industries began to operate along the Niagara River.

Some people believed that the rapid development of tourism and industry ruined the scenic beauty of the area around Niagara Falls. In 1885, the government of New York took control of the land bordering the American Falls. It then established Niagara Falls Park, covering about 430 acres (174 hectares), on the land. In 1886, Canada established Queen Victoria Park on 196 acres (79 hectares) of land near the Horseshoe Falls. Since the 1880's, much more land in the Niagara Falls area has been set aside for parks, especially on the Canadian side.

Rock slides have gradually changed the appearance of Niagara Falls through the years. In 1931, about 80,000 tons (73,000 metric tons) of rock fell from the American Falls. Several years later, approximately 30,000 tons (27,000 metric tons) of rock broke off the upper edge of the Horseshoe Falls. In 1954, about 185,000 tons (167,800 metric tons) of rock tumbled from the American Falls and nearby Prospect Point.

In 1969, U.S. Army engineers built a dam to stop the flow of water temporarily over the American Falls. A board of experts from the United States and Canada then studied the rock ledge to determine how to prevent further erosion. However, the board decided that the cost of halting erosion would be too high. It recommended that nothing be done except small measures to improve public safety. George Macinko

Niagara Movement was an organization founded by African Americans to fight racial discrimination in the United States. It existed from 1905 to 1910. At its height, the Niagara Movement had 30 branches in various American cities. It failed to win the support of most blacks, but many of the movement's ideas were adopted in 1909 by a new interracial organization—the National Association for the Advancement of Colored People (NAACP).

The Niagara Movement was founded in Niagara Falls, Canada. W. E. B. Du Bois, an African American professor at Atlanta University, led the organization (see **Du Bois, W. E. B.**). The movement placed the responsibility for racial problems in the United States on whites. The Niagara Movement thus opposed the view of the famous African American educator Booker T. Washington, who urged blacks to stop demanding equal rights (see **Washington, Booker T.**). Various branches of the movement demanded voting rights for African Americans, opposed school segregation, and worked to elect candidates who promised to fight race prejudice.

Otey M. Scruggs

Niagara River is a short river that connects Lake Erie and Lake Ontario. The river forms part of the border between the state of New York and the Canadian province of Ontario. Water from all the Great Lakes except Lake Ontario drains into the Niagara River. Most of this water drops over Niagara Falls, which is about halfway along the Niagara River's course.

The Niagara River is 34 miles (55 kilometers) long. It drops 326 feet (99 meters) during its course, an unusually sharp descent for so short a river. The dramatic drop in elevation creates a swift current and some of the roughest rapids in the world. Hydroelectric power plants along the river produce much electricity.

Description. The Niagara River starts at Lake Erie as a quiet stream about 600 yards (550 meters) wide. The river flows north, broadens, and then divides as it passes both sides of Grand Island. Beyond the island, the river becomes about 2 miles (3 kilometers) wide. It then turns sharply west and narrows before plunging over Niagara Falls.

Beyond the falls, the Niagara River turns north again and flows swiftly through a narrow gorge about 7 miles (11 kilometers) long. The Whirlpool Rapids begin in the gorge about 3 miles (5 kilometers) below the falls. The water in the rapids twists violently and circles at a speed of about 27 miles (43 kilometers) per hour. The river forms another series of rapids below the Whirlpool Rapids and then flows quietly on before emptying into Lake Ontario.

Water power. Several hydroelectric power plants stand on both sides of the Niagara River below Niagara

Falls. The major power plants are the Robert Moses power plant on the American side of the river and the two Sir Adam Beck power plants on the Canadian side. The Robert Moses power plant and a nearby pumping-generating station together have a capacity of about 2,400,000 kilowatts. The Robert Moses plant is the largest hydroelectric plant in the Eastern United States and one of the largest hydroelectric plants in the world. The two Sir Adam Beck plants and a small pumping-generating station have a combined capacity of more than 1,800,000 kilowatts.

Water for the Robert Moses and Sir Adam Beck power plants is taken from the Niagara River before the river reaches Niagara Falls. The water plunges down tunnels dug along the American and Canadian sides of the river. The tunnels carry the water into canals. The water then flows into the power plants. Each of the power projects has a large reservoir. When the demand for electricity is low, water from the tunnels is pumped into the reservoirs. When the demand increases, the reservoir water is used by the pumping-generating stations to produce additional electricity.

Commerce and industry. Ships cannot sail the full length of the Niagara River because of the falls and rapids. However, the nearby Welland Ship Canal, built by the Canadian government, provides a route for ships traveling between lakes Erie and Ontario (see **Welland Ship Canal**).

The hydroelectric power plants along the Niagara River have attracted to the region many industries that use large amounts of electricity. Most of the industries are centered in Niagara Falls, Ont., and in the area between Niagara Falls, N.Y., and Buffalo, N.Y. During the 1970's, many people in the area became concerned about water pollution caused by some of the industries.

George Macinko

See also **Niagara Falls**.

Niamey, *nyah MAY* (pop. 360,000), is the capital and largest city of Niger. The city lies on the Niger River in the southwestern part of the country. For location, see **Niger** (map).

Niamey is the chief trade and exporting center for farm products raised in Niger. It has two market places, where people buy and sell farm products. Niamey has some small food-processing plants, but few other industries. The city's main buildings include government office buildings and a *mosque* (Muslim house of worship). Most of the people live in crowded areas along the Niger River. Niamey has a small international airport.

In the early 1900's, France took control of Niger from black Africans who had long lived there. In 1926, the French founded Niamey as the capital of their colony of Niger. Niger gained independence from France in 1960. Since then, Niamey's population has grown from about 30,000 to 360,000. Robert I. Rotberg

Nibelungenlied, *NEE buh lung uhn LEET,* is a German epic poem written about A.D. 1200. The title means *Song of the Nibelungs.* The author is unknown but undoubtedly came from the Danube area of southeastern Germany or Austria. Several versions of the author's story exist today.

The poem tells of Siegfried, who owns the fabulous Nibelung treasure and a cloak of invisibility. He has also killed a dragon and bathed in its blood. The blood hardened Siegfried's flesh, protecting it from wounds. But a linden leaf had fallen between his shoulders while he bathed, leaving an unprotected spot on his back.

Siegfried wants to marry Kriemhild, the sister of King Gunther of Burgundy. To gain Kriemhild, Siegfried helps Gunther win the maiden Brunhild, Queen of Iceland. Brunhild will marry only the man who can overcome her in combat. So Siegfried disguises himself as Gunther, and beats Brunhild, winning her for Gunther. Years later, Kriemhild tells Brunhild that Siegfried, not Gunther, had beaten her, adding some insulting lies to the revelation. In revenge, Brunhild orders Hagen, one of Gunther's servants, to murder Siegfried. Hagen kills Siegfried by thrusting a spear into the unprotected spot on his back.

Several years later, Kriemhild marries Etzel, mighty king of the Huns. But she never forgets Siegfried. Kriemhild invites the Burgundians to visit her and has them slaughtered. Only Hagen survives. Kriemhild asks him to reveal where he has hidden the Nibelung treasure. When he refuses, she kills him. Hildebrand, a warrior at the court of Etzel, horrified by Kriemhild's treachery, kills her.

The background. Two actual events form the basis for parts of the *Nibelungenlied.* In A.D. 437, the Huns destroyed the Burgundians, an east Germanic tribe. The Burgundian king and members of his royal household died in the battle. The king of the Huns, Attila (called Etzel in the poem), was not connected with this event. Attila died on his wedding night in 453. Some historians said that he was murdered by his Germanic bride.

The Nibelungen-poet clearly was not the first to deal with this story material. The Icelandic *Edda,* composed before the *Nibelungenlied,* contains *lays* (short poems) on the same themes. The early Germanic peoples composed lays to celebrate the great heroes and events of their past. The lays were revised, and in the course of centuries the original historical events were greatly altered. Unknown poets combined the events of 437 and 453 into a single historic lay. In this lay, a Burgundian bride kills Attila to gain revenge for the death of her relatives, who had been killed by Attila's Huns.

Many of the themes and much of the plot of the older Germanic lays can still be found in the *Nibelungenlied,* but the poet changed the material. Scholars have not been able to trace the *Nibelungenlied* story of Siegfried's death to particular historical personalities and events. In fact, Siegfried's supernatural powers give his story the quality of a fairy tale.

The style. The *Nibelungenlied* is written in stanzas. Each stanza consists of four long lines of two pairs of rhymed couplets. The author shows a keen understanding of human psychology in developing the motives that cause the proud figures in the poem to act as they do. The great climaxes lie in the tense dialogues in which the rivals confront each other.

Scholars cannot say precisely what the Nibelungen-poet retained and what he inserted. The courtly aspects were probably added around 1200, when courtly culture flourished in Germany. The love between Siegfried and Kriemhild, the festivals of knights and ladies, and the many heroes reflect courtly virtues. These aspects provide the softer accents that contrast with and heighten the effect of the tragic ending. James F. Poag

Nicaea, Councils of. See Nicene councils.

David Mangurian

The Nicaraguan countryside includes sharply rising mountains and grazing land for cattle and other livestock. This scene is in western Nicaragua, near the city of León.

Nicaragua

Nicaragua, *NIHK uh RAH gwuh,* is the largest country of Central America in area. It extends from the Pacific Ocean to the Caribbean Sea. About three-fifths of the country's people live in a fertile region on the Pacific side. In this region is Managua, the capital and largest city of Nicaragua.

Most Nicaraguans have both Indian and Spanish ancestors. In the early 1500's, the Spaniards began arriving in what is now Nicaragua. They named the land for an Indian chief and his tribe—both called Nicarao—who lived there. The Nicarao way of life, like that of most of the other Indians of Nicaragua, has blended with Spanish customs and traditions. Today, Nicaragua has only a few Indian groups that follow traditional ways of life.

Coffee and cotton are Nicaragua's leading sources of income. They are grown in the Pacific Region of western Nicaragua and in the Central Highlands. Few people live in the thickly forested Caribbean Region in the eastern part of the country.

Government

The national government of Nicaragua is headed by a president. The people elect the president—and a vice president—to five-year terms. The president appoints a Cabinet to help carry out the day-to-day operations of the government. The National Assembly makes the country's laws. The people elect the 90 members of the Assembly to five-year terms. All Nicaraguans 16 years of age and older may vote in elections.

Nicaragua is divided into 15 departments and 2 *autonomous* (self-governing) regions on the Caribbean coast. The country is further divided into municipalities for purposes of local government. The people elect a mayor and a council to administer each municipality.

Nicaragua has a number of political parties, which often form alliances. Two major parties are the Sandinista National Liberation Front (FSLN), commonly called the Sandinistas, and the Liberal Constitutionalist Party (PLC).

The Supreme Court of Justice is Nicaragua's highest court. It hears appeals from lower courts. It has 16 judges, who are elected by the National Assembly to five-year terms.

About 12,000 people serve in the armed forces of Nicaragua, which consist of an air force, army, and navy. Service is voluntary.

People

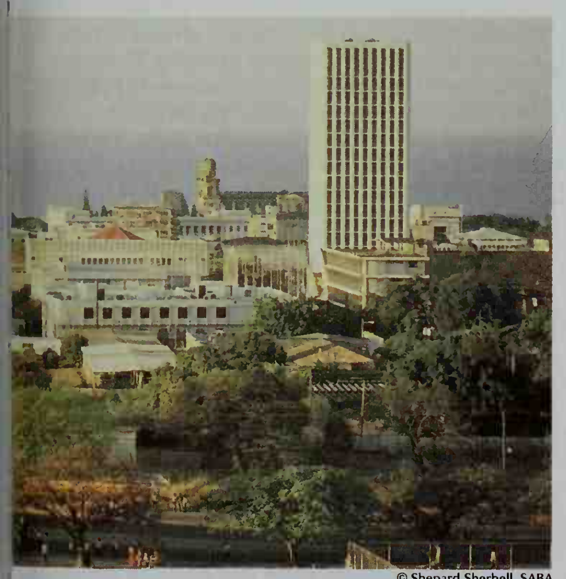
The majority of Nicaraguans are *mestizos* (people with white and Indian ancestors). The way of life of the mestizos is similar to that of Spanish Americans in other Central American countries. Most Nicaraguan people belong to the Roman Catholic Church and speak Spanish. The only Indian groups in Nicaragua that still generally speak their own languages and follow their traditional ways of life live in the thinly populated Caribbean Re-

Facts in brief

Capital: Managua.
Official language: Spanish.
Area: 50,193 mi² (130,000 km²). *Greatest distances*—north-south, 293 mi (472 km); east-west, 297 mi (478 km). *Coastlines*—Pacific, 215 mi (346 km); Caribbean, 297 mi (478 km).
Elevation: *Highest*—Pico Mogotón, 6,913 ft (2,107 m) above sea level. *Lowest*—sea level along the coasts.
Population: *Estimated 2002 population*—5,350,000; density, 107 per mi² (41 per km²); distribution, 63 percent urban, 37 percent rural. *1995 census*—4,357,099.
Chief products: *Agriculture*—coffee, cotton, corn, sugar cane, bananas, rice, beans. *Manufacturing*—food and beverage products, clothing and textiles.
National holiday: Independence Day, September 15.
Money: *Basic unit*—gold córdoba. One hundred centavos equal one gold córdoba.

gion. The Caribbean Region also has several black and nixed Indian-black communities that largely follow Indi-an customs and traditions.

About a third of Nicaragua's people are poor farmers. Many of those in the Pacific Region are peasants who vork on their own farms, on cooperatives or state arms, or on large private farms. In warmer areas, agri-cultural workers live in palm- or metal-roofed houses. In he colder areas of the Central Highlands, farmers live in adobe houses with tile roofs. The Indians and blacks of he Caribbean Region live chiefly by farming small plots or by fishing, lumbering, or mining.



Nicaraguan law requires children to go to school rom the age of 6 through 12. Before 1980, only about half the country's children did so, and most of these chil-dren lived in cities or towns. Nicaragua did not have enough schools, and many rural areas had no schools at all. But since then, the government has built hundreds of rural schools. The government also conducted a suc-cessful literacy campaign headed mainly by young vol-unteer teachers.

Nicaragua has three universities. The National Univer-sity of Nicaragua, in León and Managua, is the oldest and largest university. It was founded in 1812 and has more than 22,000 students.

The land and climate

Nicaragua has three main land regions: (1) the Pacific Region, (2) the Central Highlands, and (3) the Caribbean Region. The climate is chiefly tropical, with some differ-ences among these regions.

The Pacific Region is largely a low area extending rom Honduras to Costa Rica. Several volcanoes, some of them active, are in this low area. Lake Managua and Lake Nicaragua lie in the central and southern sections. Mountains up to 3,000 feet (910 meters) high rise along he Pacific coast. Nicaragua's largest cities and many arge farms are in the Pacific Region.

© Shepard Sherbell, SABA

Managua is the capital, largest city, and chief commercial cen-er of Nicaragua. The city is located in western Nicaragua.

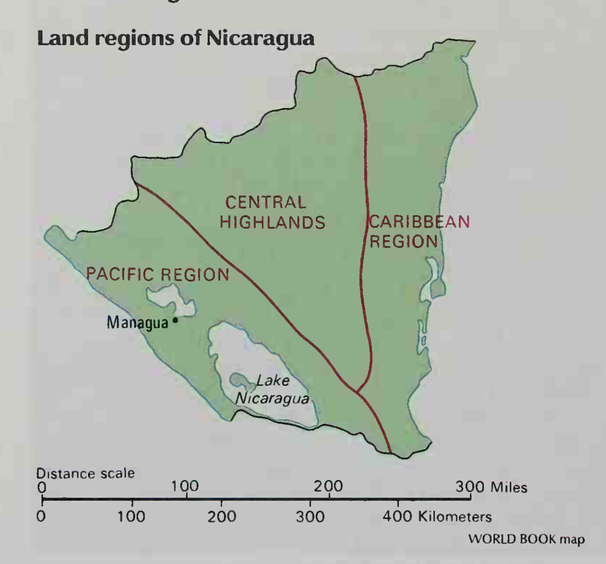
The region receives about 60 inches (150 centimeters) of rain a year. The rainy season lasts from May to No-vember. Temperatures average about 80 °F (27 °C) throughout the year.

The Central Highlands make up Nicaragua's highest and coolest region. They include the country's highest point, Pico Mogotón, a peak on the border with Hon-duras, north of Ocotal, that rises 6,913 ft (2,107 m) above sea level. Forests cover most of the region's slopes. Deep valleys lie between the mountains.

Some areas receive over 100 inches (250 centimeters) of rain a year. Most people live on farms in drier areas. Like the Pacific Region, the Central Highlands have a rainy season from May to November. Temperatures av-erage 60 to 70 °F (16 to 21 °C).

The Caribbean Region is mostly a flat plain, with some highlands sloping upward toward the west. Many rivers that rise in the Central Highlands flow through the plain. The region's only good farmland lies along the riverbanks. Rain forests cover most of the region. There are grasslands with palm and pine forests in the north. A number of small islands lie off the coast.

Nicaragua's flag was adopt-ed in 1908 from that of the United Provinces of Central America. This union of the ear-ly 1800's consisted of Nica-ragua and four other nations.



The coat of arms appears on the flag. The volcanoes stand for the Central American union, the triangle for equali-ty, the rainbow for peace, and the cap for liberty.

WORLD BOOK map

Nicaragua is bordered by Honduras, the Caribbean Sea, Costa Rica, and the Pacific Ocean.

Land regions of Nicaragua

Easterly trade winds drench the Caribbean Region with an annual average of 165 inches (419 centimeters) of rain, which falls throughout most of the year. Temperatures in the region average 80 °F (27 °C).

Economy

Nicaragua's major natural resource is the rich soil of the Pacific Region. Ash from volcanoes makes this soil fertile. Farming is the leading economic activity, though farmland makes up only about 10 percent of the land area. Nicaragua has some deposits of copper, gold, and silver, but mining provides only a small part of the nation's income. Thick forests cover about half the land. Before 1979, foreign firms owned most of the mines and forests. Since then, the government has taken control of them. Many streams in the Central Highlands could furnish cheap hydroelectric power, but few have been used. The country is developing these power sources.

Agriculture. Exported farm products provide most of Nicaragua's income. Cotton and coffee are the most valuable crops. Cotton is grown in the low Pacific areas. Coffee is grown in the Central Highlands and the Pacific Region. Sugar cane is also grown there. Other farm exports include bananas, beef cattle, and rice. Rice is the main food crop raised for use in Nicaragua. Corn and beans are grown in all regions, but chiefly in the Central Highlands. Since 1984, the government has promoted raising corn and beans on large, modern, privately owned farms in the Pacific Region.

Manufacturing. Nicaragua's industrial center is Managua, where most of the nation's electric power is generated. As in most Central American countries, the major products are processed foods and beverages, clothing, and textiles. Other products include cement, cigarettes, and goods made of leather, petroleum, and wood. The government owns about a third of Nicaragua's manufacturing companies. The rest are privately owned—about a fourth of them by foreign firms. Manufacturing activity has declined since the late 1970's.

Service industries. Wholesale and retail trade form the leading service industry in Nicaragua. The marketing of farm products is the most important type of trade in the country. Government activities rank second in importance. Other service industries include finance, insurance, and real estate, and transportation, communication, and utilities.

Foreign trade. Nicaragua's chief trading partners include the United States, Mexico, and several Western European countries. Nicaragua belongs to the Central American Common Market, an economic union of five nations.

Transportation. Nicaragua has some good roads, especially in the Pacific Region. The Pan American Highway is the major highway (see **Pan American Highway**). Many populated areas cannot be reached by automobile, and the people use mules or oxcarts. Nicaragua has an average of only about 1 automobile for every 100 people. There are some railways, all in the Pacific Region. Managua has an international airport.

Communication. Nicaragua has few newspapers. The largest are *La Prensa* and *El Nuevo Diario* of Managua and *Barricada,* the paper of the Sandinista National Liberation Front. Government-operated postal, telegraph, and telephone systems serve only cities and towns. Many of the country's radio stations and all of its television channels are publicly operated. There are several privately owned radio stations.

History

The Indian period. Little is known of what is now Nicaragua before the Spaniards arrived in the early 1500's. A series of Indian states occupied the Pacific Region and the Central Highlands. They built fortified towns, and had highly developed markets and a system of social classes that included slaves. Less developed Indian societies lived in the Caribbean Region.

The colonial period. In 1502, Christopher Columbus arrived at what is now Nicaragua, and claimed the land for Spain. A Spanish expedition from Panama explored the Pacific Region in 1522. Many of the Nicarao Indians who lived in the region were baptized into the Roman Catholic Church.

Another expedition from Panama arrived in 1524. The leader, Francisco Fernández de Córdoba, founded Granada and León near the main sources of Indian labor. The Indians worked on the Spaniards' farms and in their mines. In 1570, Nicaragua came under the control of the Audiencia of Guatemala, a high court of Spanish judges and administrators that ruled most of Central America. Nicaragua was part of the colony of New Spain, but the court had great power because it was so far from Mexico City, the colonial capital.

The Spaniards explored the Caribbean coast of Nicaragua, but did not settle there. During the 1600's and 1700's, other Europeans—chiefly the English—occupied that region from time to time. English, Dutch, and French pirates had hideouts there, and attacked Spanish shipping in the Caribbean Sea. The pirates also raided Spanish towns to the west. During the 1700's, the English gained control over the Miskito, or Mosquito, Indians of the Caribbean coast. The United Kingdom gave up its hold on the region to Nicaragua in the mid-1800's.

Independence. On Sept. 15, 1821, Nicaragua and other Central American states also declared their independence. These states later became part of the Mexican empire, but broke away in 1823 and established the

Workers load bananas at a Nicaraguan port, *above.* Most of Nicaragua's income comes from exported farm products, including bananas, coffee, cotton, sugar cane, and rice.

United Provinces of Central America. In general, this union followed liberal economic and political policies. For example, the member states established various civil rights. In addition they also ended the special rights of powerful nobles and the Roman Catholic Church.

The union began to collapse under various pressures, including efforts by the conservative landowners and the clergy to regain their old privileges. In 1838, Nicaragua left the union. By then, a dispute had developed between León, the liberal center, and Granada, the conservative center. These two cities struggled for control of Nicaragua, and fighting often broke out.

The liberals of León asked William Walker, an American military adventurer, to help them. In 1855, Walker arrived with a band of followers and captured Granada in a surprise attack. But instead of helping the liberals, he seized control of the government in 1856. The next year, the liberals and conservatives joined forces and drove Walker from the country.

The United States and Nicaragua. For many years, the United States had wanted to build a canal across Nicaragua to link the Atlantic and Pacific oceans. In 1901, President José Santos Zelaya of Nicaragua set certain limits on U.S. rights in the proposed Nicaragua Canal zone. The United States did not accept these limits, and shifted its attention to Panama as the site of the canal. Zelaya then threatened to sell rights to the canal to some rival country of the United States. He also canceled contracts with a number of U.S. firms.

In 1909, a revolt broke out against Zelaya, a harsh ruler. He was driven from office after the United States sided with the rebels. In 1911, U.S. banks began to lend money to Nicaragua under agreements that gave them control over its finances until the debts were paid in 1925. At the request of the banks and President Adolfo Díaz, U.S. marines landed in Nicaragua in 1912 to put down forces that opposed American control. The marines remained in Nicaragua almost continuously until 1933 to protect United States interests and supervise elections.

Rebels led by General Augusto César Sandino tried to make the U.S. forces leave Nicaragua. From 1927 to 1933 the rebels raided the U.S. marines from hideouts in the mountains. The United States trained a new Nicaraguan army, called the National Guard, to help the marines. Anastasio Somoza García became head of the National Guard. In 1934, after the marines had left, Somoza had members of the National Guard murder Sandino.

The Somoza period. In 1936, Somoza forced President Juan Sacasa to resign. Somoza, who was Sacasa's nephew, became president the next year after an election in which he was the only candidate. He ruled as a dictator and established great political and economic power for himself and his family.

From 1937 until 1979, a Somoza ruled Nicaragua either as president or as the real power behind the government. Anastasio Somoza was assassinated in 1956, and his older son, Luis, replaced him as president. Luis held the presidency until 1963. His brother, Anastasio Somoza Debayle, became president in 1967. In general, the Somozas were eager to cooperate with the United States and had support from the U.S. government.

Political stability under the Somoza family rule attracted U.S. investments, and Nicaragua's economy expanded. The 160-mile (257-kilometer) Rama Road was built between 1968 and 1980 with U.S. aid. It helped connect the Pacific and Caribbean coasts of Nicaragua.

In 1972, an earthquake in Nicaragua killed about 5,00 people. It destroyed much of Managua. The city was rebuilt near the site of the earthquake. Also in 1972, President Anastasio Somoza Debayle turned over formal power to a civilian junta. However, he continued to rule from behind the scenes as head of the National Guard. In 1974, Somoza was elected president for six years.

Rebel victory. Widespread protests against Somoza's rule began in the mid-1970's. Protesters demanded Somoza's removal from office. Many of the opponents belonged to the Sandinista National Liberation Front, then a guerrilla group. The group was named after Augusto César Sandino. Many other political and economic groups joined the Sandinistas' protests.

By 1978, the conflict between the rebels and the government had become a civil war. The rebels won the war in July 1979. They forced President Somoza to resig and leave the country. They then set up a new government. In 1980, Somoza was assassinated in Paraguay.

Recent developments. The new government, headed by the Sandinistas, took over key parts of the economy, including agricultural exports, banking, insur ance, and mining. But the economic system is a mixture of public and private ownership. The government adopted many policies designed to help the poor and improve the economy, which had been badly damaged in the civil war. But economic recovery from the war ha been slow, and hardships remain for many people.

In the early 1980's, internal opposition to the Sandini tas developed concerning economic policy and the typ of government to be established. In 1981, the United States, charging that Nicaragua was providing weapons to rebels in other Central American countries, cut off ai to the country. In that year, former members of Somoza's National Guard and others stepped up attacks from bases over the border in Honduras. In response, the Nicaraguan government declared a state of emergency and launched a campaign to build up its military

orces. In 1983, several thousand anti-Sandinistas invad-
:d northeastern Nicaragua. Until 1990, fighting between he invaders—called *contras*—and government forces ook place in Nicaragua, resulting in many deaths. The Jnited States gave financial aid to the contras. The gov-
:rnment was aided by the Soviet Union, Cuba, Western :uropean nations, and other countries.

Daniel Ortega became head of the Sandinista govern-
nent. In 1984, he was elected president of Nicaragua. Jnited States President Ronald Reagan charged that the ;andinistas had set up a Communist dictatorship and vere providing aid to rebels in other Central American :ountries. In late 1983 and early 1984, the United States ıided the contras in placing mines in Nicaraguan har-
ɔors. In 1985, Reagan ordered an embargo on U.S. trade vith Nicaragua. Before the embargo, the United States ıad been Nicaragua's chief trading partner.

Some people in the United States opposed U.S. finan-
:ial aid to the contras. In the 1980's, the U.S. Congress 'oted sometimes for and sometimes against further aid o the rebels. In 1986, the International Court of Justice— ıfter reviewing complaints from Nicaragua—concluded hat the United States acted illegally in helping mine the Nicaraguan harbors and providing aid to the contras. Jnited States officials rejected the conclusion.

In March 1988, the Sandinistas and the contras negoti-
ıted a cease-fire. They held talks to try to resolve their lifferences. Although no peace agreement was reached, he level of fighting declined following the talks. But ighting resumed after the government refused to ex-
end the cease-fire past Oct. 31, 1989.

In elections held in February 1990, Violeta Barrios de Chamorro of the National Opposition Union (UNO), a jroup of 14 anti-Sandinista parties, was elected presi-
lent. The government and the contras signed a cease-
ire agreement in April 1990. By June 1990, the contra roops had been disbanded.

After the election of Chamorro, the United States end-
:d its trade embargo with Nicaragua. During the 1990's, he government began to privatize some areas of the :conomy, such as banking and mining, that had been ıationalized by the Sandinistas. But Nicaragua still faced evere economic problems, including high inflation and ɔoor industrial performance.

In a presidential election held in 1996, José Arnoldo Alemán Lacayo of the rightist Liberal Alliance defeated Daniel Ortega of the Sandinistas and several other can-
lidates. The main party in the Liberal Alliance was the iberal Constitutionalist Party (PLC). In a 2001 presidential lection, Enrique Bolaños Geyer of the PLC defeated Or-
ega, who again ran as the Sandinista candidate.

In 1998, Hurricane Mitch struck Nicaragua, producing oods and landslides. The storm killed about 3,000 peo-
le and caused more than $1 billion in damage.

Nice, *nees* (pop. 345,892; met. area pop. 888,784), is a resort city on the French Riviera and a Mediterranean port. It lies at the foot of the Alps near Italy (see **France** [political map]). The city has wide avenues, luxurious hotels, and villas surrounded by gardens. The Paillon River divides it into the Old Town to the east and the modern, western part. The Alps protect Nice from cold northern winds and give it a mild winter climate.

Most of the people depend for their living on the tourist trade. Most tourists come during the winter vacation season between January and April, or else from July to September. The Mardi Gras, the height of the Riviera Carnival, is one of Nice's many winter festivals (see **Mardi Gras**). The industries of Nice produce olive oil, perfumes, processed fruit, soap, cement, and other products. Railroad lines to Marseille and to the Italian cities of Genoa and Turin pass through Nice. Greek settlers founded Nice about 400 B.C. William M. Reddy

Nicene Councils, *ny SEEN,* were two councils of the Christian church held in Nicaea (Nice), in what is now northwest Turkey.

The first council was called in 325 by Emperor Constantine to settle the dispute caused by the Arian views of the Trinity. Arius was a priest of Alexandria who believed that Christ is not of the same essence as God. The council adopted the so-called *Nicene Creed.* This declared that God and Christ as God are of the same essence. The first council also fixed the time for observing Easter. In some regions, the Christian Easter had been observed on the same day as the Jewish Passover. In others, Easter had been observed on the following Sunday.

The *Nicene Creed* summarized the chief articles of the Christian faith of that time. It is next oldest to the Apostles' Creed. It was adopted originally in the following form, but has been amplified since:

> We believe in one God, the Father Almighty, maker of all things, both visible and invisible; and in one Lord, Jesus Christ, the Son of God, Only begotten of the Father, that is to say, of the substance of the Father, God of God and Light of Light, very God of very God, begotten, not made, being of one substance with the Father, by whom all things were made, both things in heaven and things on earth; who, for us men and for our salvation, came down and was made flesh, was made man, suffered, and rose again on the third day, went up into the heavens, and is to come again to judge both the quick and the dead; and in the Holy Ghost.

The second council was called in 787 by the Empress Irene and her son Constantine. The Emperor Leo, Irene's deceased husband, had forbidden the use of images for any purpose. The council was called because of opposition to the decree. The empress revoked the decree after the council had laid down principles governing the veneration of images. Eugene TeSelle

Nicholas I (1796-1855) was czar of Russia from 1825 to 1855. He was a hard-working leader whose conservatism kept him from moving Russia into the modern world.

Nicholas succeeded his brother Alexander I after Alexander's death in December 1825. At that time, a group of liberal army officers, who later became known as *Decembrists,* tried to take power. Nicholas, shocked by the rebellion, had five of the leaders executed and the others exiled to Siberia. He was determined to fight liberalism in Russia and revolution in Europe. In 1830-1831, he suppressed a Polish uprising that was aimed at freeing Poland from the Russian empire. In 1849, he sent Russian armies into Hungary to crush a revolt for Hungarian independence from Austria.

Within the Russian empire, Nicholas demanded loyalty to himself and to the Russian Orthodox Church. Censorship was severe during his reign. However, Russian literature, art, and music continued to thrive. Some reforms did occur under Nicholas. With his approval, Russia's first modern law code was issued in the 1830's. Nicholas also authorized improvements in the living conditions of certain peasants.

In 1828-1829, Nicholas won territory for Russia and helped win independence for Greece in a war with the Muslim Ottoman Empire. The Ottoman Empire was centered in what is now Turkey. In 1853, Nicholas again went to war with the Ottomans. Fearful of Russian expansion, Britain and France helped the Ottomans in what became the Crimean War. Nicholas died during the war, which Russia later lost. Joseph T. Fuhrmann

See also **Alexander II; Crimean War; Russia** (History).

Nicholas II (1010?-1061) was crowned pope in 1059. His reign is best known for the Lateran synod of 1059, which reformed the procedures for electing a pope. The synod issued a major decree that said the cardinal bishops would, in effect, propose a candidate for pope. Then all the cardinals would "elect," which really meant accept, the proposed candidate. The newly elected pope would be presented to the people of Rome for approval. A notice would then be sent to the Holy Roman emperor for his approval. The decree's purpose was to deny the Roman nobility the right to interfere with the choice of pope. Later, it was also applied to imperial influence on papal elections.

The synod also issued legislation to enforce celibacy of the clergy and to prohibit *simony,* the selling of church offices, and *lay investiture,* by which *secular* (nonreligious) rulers presented clergymen with the symbols of their offices. This authority enabled rulers to control who received those offices. To secure his electoral decree, Nicholas allied the papacy with the Normans in southern Italy. At times this alliance worked effectively to protect the popes from turbulent Roman politics and from German intervention. But sometimes the Normans themselves interfered in Rome.

Nicholas was born in Burgundy, or possibly Lorraine, France. His given name was Gerhard. Thomas F. X. Noble

See also **Pope** (The early Middle Ages).

Nicholas II (1868-1918), the last czar of Russia, ruled from 1894 to 1917. He succeeded his father, Alexander III. Nicholas believed a czar must have absolute power and opposed parliamentary government. He possessed great personal charm but lacked the vision of a strong leader.

Nicholas was born in St. Petersburg. During his reign industry developed rapidly in Russia. Literature, science and other branches of learning also made impressive gains. But the middle class increasingly felt the monarchy was out of touch with the needs of the new industrial society. Workers in the cities became dissatisfied with living and working conditions.

Meanwhile, Nicholas attempted to expand Russian territory in Asia. This effort led to the Russo-Japanese War (1904-1905), which Russia lost. The war sharpened dissatisfaction with the government, and the people revolted in 1905. Workers joined with peasants and intellectuals to force Nicholas to grant reforms. He agreed to establish an elected legislature and granted the people civil liberties.

Beginning in 1906, Nicholas' government expanded public education, gave workers some insurance against illness and injury, and allowed peasant families to assume ownership of the village land they were farming. But these reforms were interrupted by the outbreak of World War I in 1914. Nicholas' approval of a buildup of Russian troops along the country's borders with Germany and Austria-Hungary helped trigger the war.

Russia suffered severe losses in World War I. In 1915 Nicholas assumed direct command of the army. As a result, the people blamed him for Russia's military failures. Many Russians also unjustly accused Alexandra, his

German-born wife, of treason. These problems and shortages of food and fuel led the people to revolt in March 1917. Nicholas lost all political support, and he gave up his throne on March 15.

In November 1917, revolutionaries called Bolsheviks (later known as Communists) seized power. They imprisoned Nicholas and his wife and children in Yekaterinburg in the Ural Mountains and killed them there on July 17, 1918. Joseph T. Fuhrmann

Nicholas V (1397-1455) was elected pope in 1447. Nicholas was the first true Renaissance pope. He drew inspiration from intellectual developments in Florence, the leading humanist center in Italy (see **Renaissance** [Humanism]). Nicholas spent vast sums on an important collection of ancient Greek, Roman, and early church manuscripts. These writings became the core of the Vatican library. Nicholas sponsored many humanists in Rome as translators of Greek works into Latin, seeing the papal role not only as head of the church but also as head of Western civilization.

Nicholas aimed to once again make Rome the capital of the Christian world. He proclaimed 1450 a jubilee year, which attracted many pilgrims to Rome. He also rebuilt many structures in the city and made ambitious plans to rebuild the Vatican. Nicholas was born in Sarzana, Italy, near La Spezia. His given and family name was Tommaso Parentucelli. Charles L. Stinger

Nicholas, Saint (A.D. 300's), is one of the most popular saints of the Christian church. He is the patron saint of sailors, travelers, bakers, merchants, and especially children. Little is known about his life except that he was Bishop of Myra in Lycia, on the coast of Asia Minor. According to tradition, he was born in Lycia. Some legends say he made a pilgrimage as a boy to Egypt and Palestine, that he was imprisoned during Diocletian's persecution, and released under Constantine the Great. In addition, legends say Nicholas attended the Council of Nicaea in 325. Numerous miracles were credited to him.

Much of Europe still observes December 5, St. Nicholas Eve, and December 6, the supposed day of Saint Nicholas's death, as special holidays. For example, in Germany, Switzerland, the Netherlands, and Belgium, men in bishops' robes pose as Saint Nicholas. They visit children, examine them on their prayers, urge them to be good, and give them gifts. This custom probably originated in the legend that Saint Nicholas gave gold to each of three girls who did not have dowries and so could not get married.

Saint Nicholas evolved into Father Christmas in Germany and Protestant northern Europe. Dutch immigrants brought the tradition of "the visit of Saint Nicholas" to America. The Dutch settlers and their English neighbors transformed Nicholas into the kind and jolly patron of American Christmas. The name *Santa Claus* comes from *Sinterklaas,* which is Dutch for *Saint Nicholas.*

Nicholas of Cusa, *KOO suh* (1401-1464), was a German theologian, scholar, and statesman. Nicholas wrote extensively on philosophy, theology, mathematics, and astronomy. In his most famous work, *On Learned Ignorance* (1440), Nicholas argued that reason is inadequate to determine truth. In his writings on astronomy, Nicholas suggested that the earth is in motion and is not the center of the universe. Thus, he was a forerunner of the theories developed in the 1500's by the Polish astronomer Nicolaus Copernicus.

Nicholas was born at Kues, Germany, near Trier. The Latin form of *Kues* is *Cusa.* In 1437, with the approval of Pope Eugene IV, Nicholas traveled to Constantinople to arrange a meeting between Eastern and Western church officials to discuss reunification. In 1438, Nicholas went to Germany to help regain for the papacy the allegiance of the Holy Roman Empire. This mission ended successfully in 1448 with the signing of the Concordat of Vienna. Pope Nicholas V made Nicholas a cardinal in 1449. In 1450, Nicholas became bishop of Brixen (now Bressanone), Italy. William J. Courtenay

Nichols, Mike (1931-), is a famous German-born director known for his work in motion pictures and on the stage. Nichols won an Academy Award for directing *The Graduate* (1967), his second movie. His other films include *Who's Afraid of Virginia Woolf?* (1965), *Catch-22* (1970), *Carnal Knowledge* (1971), *Silkwood* (1983),

Working Girl (1988), *Postcards from the Edge* (1990), *The Birdcage* (1996), and *Primary Colors* (1998).

Nichols began his directing career with *Barefoot in the Park* (1963), a Broadway comedy. Nichols later directed such plays as *The Knack* (1964), *The Odd Couple* (1965), *Luv* (1966), *Streamers* (1976), *The Real Thing* (1984), and *Biloxi Blues* (1988).

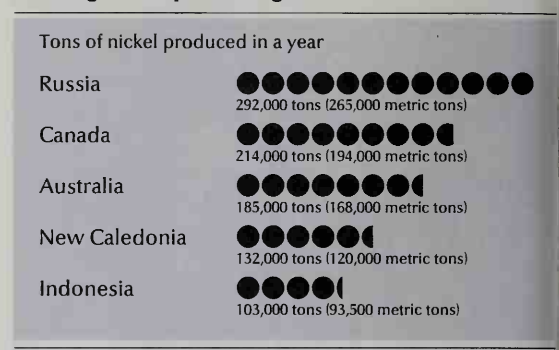
Nichols was born in Berlin on Nov. 6, 1931, and originally named Michael Igor Peschkowsky. He came to the United States in 1939 and became a U.S. citizen in 1944. He joined a Chicago theater group in 1955. Later, he and another member of the group, Elaine May, formed a team that put on satirical comedy skits. Gene D. Phillips

Nicholson, Ben (1894-1982), was an English artist noted for his abstract paintings. Nicholson's most valued artistic contribution is the *relief,* a three-dimensional abstract picture created by cutting, carving, and painting flat boards. In his reliefs, Nicholson explored the interaction of form and light. His early reliefs are painted white. His later reliefs incorporate subtle color and texture.

Nicholson was born in Denham, near London, on April 10, 1894. His father was Sir William Nicholson (1872-1949), also an artist. Ben Nicholson's early works were charming and realistic decorative paintings. He also painted still lifes that demonstrate the influence of the French artist Paul Cézanne and the Cubism movement. Nicholson died on Feb. 6, 1982. Pamela A. Ivinski

Nicholson, Jack (1937-), is an American motion-picture actor and director. He often plays a cocky, rude outsider or free-spirited individualist who rejects conventional society. Nicholson has won three Academy Awards. He won the 1975 best actor award for *One Flew Over the Cuckoo's Nest* and the 1997 award for *As Good As It Gets.* He won the 1983 award as best supporting actor for *Terms of Endearment.*

M. Ginies, Sipa Press



Jack Nicholson

Nicholson was born in Neptune, New Jersey, on April 22, 1937. He made his film debut in *The Cry Baby Killer* (1958) and first gained recognition in *Easy Rider* (1969). His other major films include *Five Easy Pieces* (1970), *Carnal Knowledge* (1971), *The Last Detail* (1973), *Chinatown* (1974), *The Shining* (1980), *Prizzi's Honor* (1985), *The Witches of Eastwick* (1987), *Batman* (1989), *Wolf* (1994), *Blood & Wine* (1997), and *The Pledge* (2001). Nicholson has also directed films, beginning with *Drive, He Said* (1971). Rachel Gallagher

Nickel is a white metallic chemical element used in alloys. Nickel is magnetic, takes a high polish, and does not tarnish easily or rust. It can be hammered into thin sheets or drawn into wires. One pound (0.4 kilogram) of pure nickel could be drawn into a wire 80 miles (130 kilometers) long. The Chinese used an alloy of nickel more than 2,000 years ago. Pure nickel was first isolated in 1751 by the Swedish scientist Axel Cronstedt.

Nickel's *atomic number* (number of protons in its nucleus) is 28. Its *relative atomic mass* is 58.6934. An element's relative atomic mass equals its *mass* (amount of matter) divided by $\frac{1}{12}$ of the mass of carbon 12, the most abundant form of carbon. Nickel's chemical symbol is Ni

Leading nickel-producing areas

Figures are for 2000.
Source: U.S. Geological Survey.

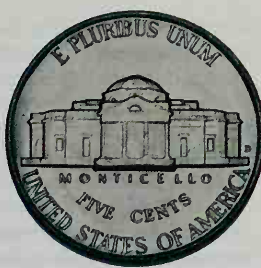
Industrial uses. Nickel is used in structural work and in electroplating chiefly because it resists corrosion. Printing plates electroplated with nickel withstand hard use (see **Electroplating**). *Nickel peroxide,* a nickel compound, forms the active material of the positive electrode in the Edison storage battery. Nickel is also used in the nickel-cadmium storage battery (see **Battery**).

An important use for nickel is to promote certain chemical reactions by *catalysis* (see **Catalysis**). The nicke itself is not changed in the process and can be used repeatedly. Nickel is used as a catalyst in a process called *hydrogenation* to produce solid vegetable oils for cooking. See **Hydrogenation**.

Nickel-iron alloys. Perhaps the largest use for nickel is as an additive to cast iron and steel. It makes iron more *ductile* (easily formed) and increases its resistance to corrosion. Nickel also makes steel more resistant to impact. Manufacturers often use steel alloyed with nickel to make armor plate and machine parts.

Invar is an alloy of nickel, iron, and other metals. It is valued for meter scales and for pendulum rods. Invar expands or contracts little as its temperature changes.

Monel metal is an alloy of nickel and copper used in sheet-metal work. It has an especially high resistance to corrosion. See **Monel metal**.



Nickel silver, also called *German silver,* is a nickel alloy used in tableware. See **Nickel silver**.

Mining nickel. The chief mineral ore of nickel is *pentlandite,* a mixture of sulfur, iron, and nickel. Other nickel ores include *millerite* and *niccolite.*

Russia is the world's leading producer of nickel. It produces about a fourth of the world total. Australia, Canada, Indonesia, and New Caledonia are also important nickel-producing areas. Robert J. Doedens

Nickel is the common name for a U.S. copper-nickel coin. It is worth five cents, and its official name is the *five-cent piece.* The current Jefferson nickel has been minted since 1938. It has a profile of Thomas Jefferson on the *obverse* (front), and a picture of Monticello, Jefferson's home, on the *reverse* (back). A nickel with an Indian head on the obverse and a buffalo on the reverse was minted from 1913 through 1938. Nickels made from 1883 through 1912 had a head of Liberty on the obverse and a *V* (Roman numeral five) on the reverse. The earliest U.S. five-cent pieces had a shield on the obverse and

WORLD BOOK photo by James Simek

The U.S. nickel shows Thomas Jefferson and Monticello.

a *5* on the reverse. They were minted between 1866 and 1883. Burton H. Hobson

Nickel silver is an alloy of copper, nickel, and zinc. It is also called *German silver* because it was first made in Hildburghausen, Germany. It is a yellowish metal that is harder than silver. Nickel silver tarnishes easily, but it takes a good polish. Much of the silverware used today is made of nickel silver plated with real silver. It looks like solid silver when new, but the plate wears off with use. Vinegar and strong salt solutions may combine with nickel silver to form substances that can make people ill. Silver-plated tableware should not be used with these types of liquids after the silver plate has worn off. See also Alloy. Melvin Bernstein

Nickelodeon. See Motion picture (The history of motion pictures; picture).

Nicklaus, *NIHK luhs,* **Jack** (1940-), an American golfer, ranks among the greatest players in the history of golf. Nicklaus was the first player to win all four of golf's major titles at least twice. He won the British Open in 1966, 1970, and 1978; the U.S. Open in 1962, 1967, 1972, and 1980; the Masters Tournament in 1963, 1965, 1966, 1972, 1975, and 1986; and the Professional Golfers' Association (PGA) tournament in 1963, 1971, 1973, 1975, and 1980. He won the United States Amateur tournament in 1959 and 1961 before turning professional.

Jack William Nicklaus was born in Columbus, Ohio. He was nicknamed the "Golden Bear" for his blond hair. His first professional tournament victory came in 1962 when he defeated Arnold Palmer in a playoff for the 1962 U.S. Open championship. Nicklaus has also designed a number of golf courses. Marino A. Parascenzo

Nicolet, *nee kaw LEH* or *nihk uh LAY,* **Jean,** *zhahn* (1598-1642), also spelled Nicollet, was a French explorer, fur trader, and interpreter. He was the first European to enter Lake Michigan and travel in what is now Wisconsin, adding to French knowledge of North America.

Nicolet was born Jean Nicolet de Belleborne in Cherbourg, France. He traveled to North America in 1618 with Samuel de Champlain, a French explorer. For two years, Nicolet lived among Algonquin Indians of Allumette Island on the Ottawa River, in present-day Quebec. In 1620, Champlain sent Nicolet to Lake Nipissing, in what is now Ontario. Nicolet traded there until 1629.

In 1634, Nicolet traveled north on Lake Huron and then west to Lake Michigan. He established friendly relations with Winnebago Indians who lived along Lake Michigan's Green Bay. But he failed to achieve the other goal of his voyage—to find a route to Asia. He also traveled up the Fox River and to the Illinois River (both in present-day Illinois). Nicolet returned to Quebec in 1635 and settled in Trois-Rivières in 1637, where he lived quietly until his death. D. Peter MacLeod

Nicosia, *NIHK uh SEE uh* (pop. 163,700), is the capital and largest city of Cyprus, an island republic in the Mediterranean Sea. For its location, see Cyprus (map). The city serves as the island's business center and as a trade center in the Mesaoria Plain. Goods produced there include almonds, fruit, olive oil, wheat, and wine.

In 1974, Turkish troops invaded Cyprus. Nicosia was divided into a Turkish Cypriot section and a Greek Cypriot section. The island's main government offices are located in the southern section. Theofanis G. Stavrou

Nicotine is a substance found in small amounts in the leaves, roots, and seeds of the tobacco plant. It can also be made synthetically. Chemists classify nicotine as an alkaloid (see Alkaloid). Pure nicotine is extremely poisonous. A small amount can cause rapid but weak pulse, vomiting, extreme weakness, or even collapse or death.

Smoking tobaccos generally contain between 1 percent and 2 percent nicotine. A smoker takes in about 0.05 milligram to 2 milligrams of nicotine per cigarette. The nicotine is quickly absorbed into the blood and reaches the brain within eight seconds after inhalation.

Nicotine is the ingredient in tobacco to which people become addicted. Most physicians agree that use of tobacco is unhealthy. In 1996, the United States Food and Drug Administration (FDA) finalized rules to prevent people under the age of 18 from using tobacco. The rules are based on the agency's finding that cigarettes and chewing tobacco are "delivery devices" for nicotine. In 2000, however, the Supreme Court of the United States ruled that the FDA does not have the authority to regulate tobacco products. Barbara M. Bayer

Niebuhr, *NEE boor,* **H. Richard** (1894-1962), was an influential Protestant theologian. He was an authority on Christian ethics and religion in the United States.

In *The Social Sources of Denominationalism* (1929), Niebuhr argued that race and social class were important in determining the religious affiliation of most Americans. In *The Kingdom of God in America* (1937) and *Christ and Culture* (1951), Niebuhr showed how Christian principles have helped shape American culture and warned Christians not to allow their values to be overly influenced by the society in which they lived. Many of Niebuhr's other writings focused on the need for religious people to integrate their beliefs with their involvement in daily life.

Helmut Richard Niebuhr was born in Wright City, Missouri. His brother, Reinhold Niebuhr, was also a Protestant theologian. Charles H. Lippy

Niebuhr, *NEE boor,* **Reinhold** (1892-1971), was a prominent American theologian. He was known for his writings on ethics.

Karl Paul Reinhold Niebuhr was born in Wright City, Missouri. After graduating from Yale Divinity School in 1915, he was a pastor at an Evangelical church in Detroit for 13 years. Niebuhr believed that Christian ethical teaching and socialism could offer solutions to social conflicts. He also was a pacifist.

In 1928, Niebuhr became a professor of the philosophy of religion at Union Theological Seminary in New York City. About this time, he began to abandon his earlier views in favor of a new approach called *Christian Realism.* According to this philosophy, an ideal society will always be beyond humanity's grasp, but moral individuals should still work for social justice. In doing so, Christians should apply moral principles in a way that is flexible enough to account for certain situations. For example, the Christian Realist approach led Niebuhr to abandon pacifism when the Nazis came to power in Germany. Niebuhr believed the Nazis were a symbol of an evil greater than the evil of war.

Niebuhr wrote several books on ethics. His most influential work is the two-volume *Nature and Destiny of Man* (1941, 1943). Niebuhr's brother, H. Richard Niebuhr, was also a prominent theologian. Charles H. Lippy

Nielsen, *NEEL suhn,* **Carl August** (1865-1931), was one of Denmark's greatest composers. His music was not widely performed during his lifetime, but it has become internationally known since his death.

Nielsen wrote in the traditional forms of the 1800's. His early works reflect an influence of the musical styles of Johannes Brahms and Franz Liszt. However, Nielsen's own style grew steadily, and he eventually developed a more modern musical language, especially in his use of more dissonant harmonies. Nielsen's compositions include six symphonies, symphonic poems for orchestra, and concertos for clarinet, flute, and violin. He also wrote chamber music, 10 cantatas, and works for both piano and organ. One of his last major compositions is *Piano Music for Young and Old* (1930), a set of 24 pieces in all keys. Nielsen was born near Odense.
Daniel T. Politoske

Niemeyer, *NEE my uhr,* **Oscar** (1907-), is a Brazilian architect. He is best known as the designer of the principal buildings of Brasília, the Brazilian capital (see **Brasília**). Niemeyer often uses primary forms for entire buildings, and in repetitious architectural elements. He has said that his designs are inspired by Brazilian climatic and social conditions, and the nation's colonial baroque art heritage.

Niemeyer was born in Rio de Janeiro. His early work was influenced by brief contact with the architect Le Corbusier. An example of this work is the Ministry of Education (1937-1943) in Rio de Janeiro. It is shaped like a slab, with windows set deeply into the concrete building to provide sun shades. During the early 1940's, Niemeyer served as chief architect for Pampulha, a new residential suburb near Belo Horizonte. Among his later works is the headquarters of the French Communist Party (1965-1980) in Paris. Dennis Domer

Niépce, *nyehps,* **Joseph Nicéphore,** *zhoh ZEHF nee say FAWR* (1765-1833), a French scientist, invented the first photographic technique, *heliography.* Niépce began experimenting in 1816. He succeeded in making a crude photograph of a courtyard in 1826. He sensitized a metal plate with bitumen and exposed it eight hours. This plate, the world's first photograph, is in the Gernsheim Collection at the University of Texas at Austin (see **Photography** [History; picture]). Niépce also produced photogravure plates from engravings and pioneered photomechanical reproduction methods.

In 1829, Niépce became the partner of L. J. M. Daguerre, who based his researches for his daguerreotype process on Niépce's earlier technique of heliography (see **Daguerre, Louis J. M.**). Niépce was born in Chalon-sur-Saône. Richard Rudisill

Nietzsche, *NEE chuh,* **Friedrich,** *FREE drihkh* (1844-1900), was a German philosopher and classical scholar. He deeply influenced many philosophers, artists, and psychologists of the 1900's.

Classical scholarship. Nietzsche's first book was *The Birth of Tragedy* (1872). It presented a new theory of the origins of classical Greek culture. Nietzsche believed that Greek culture could best be understood as resulting from a conflict between two basic human drives, the *Apollonian* and the *Dionysian.* The Apollonian was represented by Apollo, the god of the sun. The Dionysian was represented by Dionysus, the god of wine and intoxication.

The Apollonian is a drive to create clarity and order. It is a desire for a world in which everything possesses a clear identity and can be distinguished from other things. The Apollonian tendency finds expression in the visual arts, where each form stands out clearly from other forms. Nietzsche argued that, in reality, the world lacks any clear distinctions, that it is confused, chaotic, and cruel. The Apollonian drive tries to redeem the horrors of the real world by giving it the illusion of order and beauty, thus making it tolerable.

The Dionysian is a drive that tries to rip apart Apollonian illusions and reveal the reality that lies behind them. This revelation takes place only in special states of ecstasy or religious frenzy induced by drinking, wild music, and sexual license.

Nietzsche and religion. Nietzsche was a severe critic of religion, especially Christianity. In *Thus Spake Zarathustra* (1883 to 1885), he proclaimed that "God is dead." This was his dramatic way of saying that most

Messerschmidt,

The Presidential Offices was one of many buildings designed by Oscar Niemeyer in the 1950's for Brazil's capital, Brasília.

people no longer believed in God. Thus, religion could no longer serve as the foundation for moral values.

Nietzsche believed that the time had come to examine traditional values critically. In *Beyond Good and Evil* (1886) and *The Genealogy of Morals* (1887), he examined the origins of our moral systems. He argued that the warriors who dominated earlier societies had defined their own strength as "good" and the weakness of the common people they dominated as "bad." Nietzsche called this "master morality" because it represented the values of the masters.

Later, the priests and common people, who wanted to take power, defined their own weakness and humility as "good." They called the aggressive strength of the warriors "evil." Nietzsche identified these values, which he called "slave morality," with the values of the Judeo-Christian tradition that dominates Western culture. He criticized these values as being expressions of the fear and resentment of the weak against the strong.

Psychological ideas. Nietzsche's major psychological theory states that all human behavior is inspired by a "will to power." He wanted to disprove and replace a common prevalent psychological theory that was known as *hedonism.* Hedonism holds that human behavior is inspired by a desire to experience pleasure and avoid pain. Nietzsche argued that people are frequently willing to increase their pain, strain, or tension to accomplish tasks that allow them to feel power, competence, or strength.

Nietzsche did not mean that people wanted only to dominate each other, nor that they were only interested in physical or political power. He wrote that we also want to gain power over our unruly drives and instincts. He thought that the self-control exhibited by artists and people who practice self-denial for religious reasons was actually a higher form of power than the physical bullying of the weak by the strong.

Nietzsche's ideal was the *overman* (or *superman*), a passionate individual who learns to control his or her passions and use them in a creative manner. This superior human being channels the energy of instinctual drives into higher, more creative, and less objectionable forms. Nietzsche believed that such "sublimation" of energy is far more valuable than the suppression of the instincts urged by Christianity and other religions.

His life. Nietzsche was born in Röcken, Saxony, near present-day Leipzig, Germany. He was a professor of classics at the University of Basel in Switzerland from 1868 to 1878, when he retired because of poor health. He then devoted himself to writing. In 1889, Nietzsche suffered a mental breakdown from which he never recovered. Nietzsche is often wrongly considered a racist, anti-Semite, and forerunner of Nazism. These charges are largely the result of distortions of his ideas by his sister, Elisabeth, and by Nazi propagandists after his death. Ivan Soll

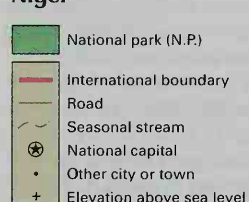
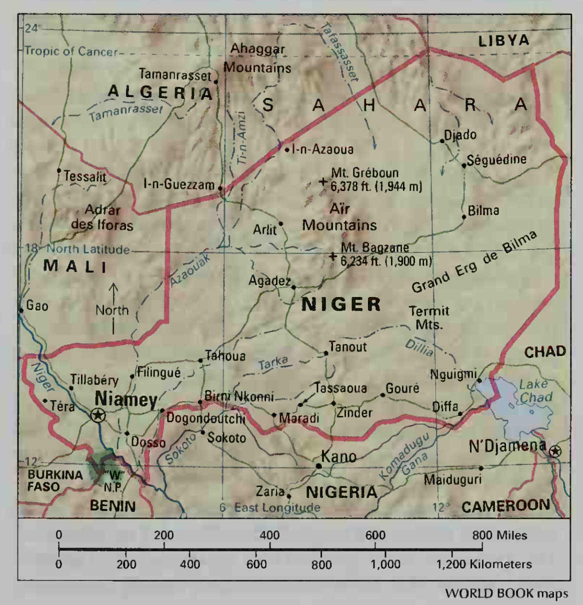
Niger, *NY juhr,* is a large, landlocked country in west Africa. Barren desert and mountains cover most of northern Niger. A grassy, thinly wooded plain extends along the southern border. The country, officially called the Republic of Niger, takes its name from the Niger River, which flows through its southwest corner. Niamey is Niger's capital and largest city.

The people of Niger belong to many different ethnic groups, each with its own language and customs. Almost all the people are black Africans, and a large majority are Muslims. Most people work as farmers and live in the south, where water and land are available.



Niger became an independent nation in 1960. France had ruled it for about 60 years before independence.

Government. The president is the most powerful official in the government. The president appoints a prime minister and other members of the cabinet, determines their responsibilities, and may end their appointments at any time. The president is elected by the people to a five-year term and is forbidden to serve more than two terms.



The National Assembly is responsible for making Niger's laws. The 83 members of the National Assembly are elected for five-year terms. Major political parties in Niger include the National Movement of the Development Society (MNSD) and the Democratic and Social Convention (CDS). The Supreme Court is Niger's highest court.

People. The people of Niger are called *Nigeriens (nee ZHEH ree ehnz).* About 98 percent of Niger's people are

Niger

WORLD BOOK maps

Facts in brief

Capital: Niamey.
Official language: French.
Area: 489,191 mi^2 (1,267,000 km^2). *Greatest distances*—east-west, 1,100 mi (1,770 km); north-south, 825 mi (1,328 km).
Elevation: *Highest*—Mount Gréboun, 6,378 ft (1,944 m) above sea level.
Population: *Estimated 2002 population*—11,395,000; population density, 23 per mi^2 (9 per km^2); distribution, 83 percent rural, 17 percent urban. *1988 census*—7,248,100.
Chief products: *Agriculture*—beans, cassava, cotton, hides and skins, livestock, millet, peanuts, peas, rice, sorghum. *Mining*—uranium, natron, phosphate, salt, tin.
Flag: Horizontal stripes of orange, white, and green; an orange circle on the white stripe. See **Flag** (picture: Flags of Africa).
Money: *Basic unit*—franc. One hundred centimes equal one franc.

black Africans. Nonblack minorities include a local white ethnic group called the Tuareg, whites from other countries, and Asians.

The major black ethnic groups in Niger include the Hausa, Djerma-Songhai, Kanuri, and Fulani. The Hausa make up about half of the population of Niger. They live mainly in the south and work as farmers. Between a fourth and a fifth of the people are members of the Djerma-Songhai ethnic group. The Djerma-Songhai are farmers and live in the southwestern corner of the country, along the Niger River. The Kanuri make up about 5 percent of the population. They farm the rich land in southeast Niger.

Many of the Fulani and the Tuareg are *nomadic* (traveling) people who raise livestock for food. Together they make up more than 10 percent of the population. During the rainy season, which lasts from July through September, these two groups live in the barren desert country of northern Niger. In dry months, they travel south in search of water and pastureland.

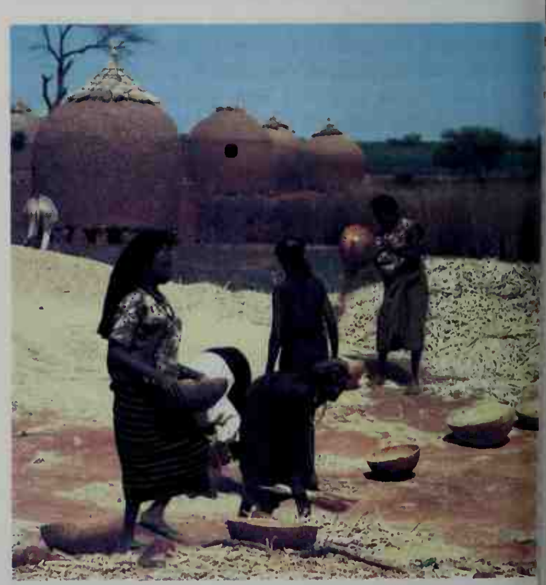
Most of the people who live in Niger's rural areas raise crops and livestock for food and for export. Some Nigeriens who live near the Niger River or Lake Chad fish for a living. The nomadic groups raise camels, cattle, goats, and sheep. In the late 1960's and early 1970's, and again in the early 1980's, severe droughts led to the deaths of many of the nomads' animals. As a result, many nomads were forced to become farmers or move to urban areas.

Niamey, Niger's capital, is its largest city by far. Other large cities include Agadez (Agades), Maradi, Tahoua, and Zinder. Most urban workers in Niger have jobs in the government and other services, or in business.

Houses in rural Niger are built according to the traditions of the ethnic groups. The Hausa live in crowded villages and towns, in houses built of sun-dried mud bricks. The nomadic Tuareg live in tents made of skins or mats. The nomadic Fulani build houses out of straw and branches, and must construct new homes every time they move. The Nigerien government has built low-cost single-family houses in Niamey. Many buildings in Niamey combine Western and African designs.

Nigeriens eat mainly grains and dairy products. Several popular dishes are made with millet and sorghum. The grains are often cooked into a porridge and served with a sauce. The nomadic Fulani and Tuareg live mainly on milk products from their herds. They also trade these products for grains and vegetables.

Most Nigerien women wear long, wrap-around skirts with short blouses and sandals. Men may wear pants or knee-length shorts with loose shirts or robes. Tuareg men wear turbans with veils. The Fulani and Tuareg, who travel in desert areas, wear long, loose robes for protection from the sun.



Education in Niger is free, but many areas do not have schools. The government operates the public schools. Many places have *Quranic* schools, which teach Muslim religious knowledge. A system of "tent schools" serves the nomadic groups in the north. When a group moves, the school moves with it. Most of Niger's adults cannot read or write. For the country's literacy rate, see **Literacy** (table: Literacy rates).

French is the official language of Niger and is widely used in the schools. However, most Nigeriens commonly speak the language of their ethnic group, instead of French. More than 85 percent of the population understand the Hausa language, which serves as the language of trade. The language of the Djerma-Songhai ranks as the second most widely spoken language. Some Nigeriens speak Arabic.

About 90 percent of Nigeriens are Muslims. A small percentage of urban dwellers are Christians. Some rural Nigeriens practice traditional African religions.

The ethnic groups in Niger have produced many kinds of crafts, music, dance, and art. Craftworkers make gold and silver jewelry, pottery, leatherwork, cloth, and wood carvings. People in both urban and rural areas enjoy traditional African styles of music. Popular forms of recreation include cycling, basketball, and soccer.

Land and climate. Niger has an area of 489,191 square miles (1,267,000 square kilometers). Sandy plateaus and desert cover the northern two-thirds of Niger. In the center of this region, a large area of mountain

Naud, AAA Ph

Hausa women in Niger work in the grain fields near their village. The Hausa people make up the country's largest ethnic group. Most Hausa make their living by farming.

ranges called the Aïr Mountains rises above the flat landscape. These mountains include the highest peak in Niger, Mount Gréboun, which stands 6,378 feet (1,944 meters) above sea level. Less than 7 inches (17.5 centimeters) of rain falls each year in the mountains. The surrounding desert receives even less rain. Temperatures in the area can reach as high as 122 °F (50 °C).

Niger's most productive zone for herding animals and growing crops is the *savanna,* a grassy, thinly wooded plain in the south. The savanna extends from the Niger River in the west, along Niger's southern border, to Lake Chad in the east. It is one of the hottest places in the world, with average daily temperatures in Niamey reaching 95 ° to 100 °F (35 ° to 38 °C). Most of Niger's rain falls in the savanna area. The city of Zinder receives about 22 inches (55 centimeters) annually.

Niger is a landlocked nation, with no outlet to the sea. The Niger River flows for about 350 miles (563 kilometers) across the southwest corner of Niger. The river floods each January and February and provides irrigation water for growing crops along its banks. Part of Lake Chad lies in southeastern Niger.

Niger's plant and animal life vary from north to south. Few plants grow in the desert, except near oases, where the date palm tree is common. Such wild animals as foxes, ostriches, and gazelles and other antelope live in the north. Palm, mahogany, kapok, acacia, and baobab trees grow in the south. Wild animals in the south include elephants, wart hogs, baboons, giraffes, and crocodiles.

Economy. Niger is one of the poorest countries in the world. Only 3 percent of its land is used to grow crops, and it has few natural resources. Droughts have devastated the economy at various times, causing sharp reductions in crop and livestock production.

Niger's most important economic resource is uranium. The country is a major producer and exporter of uranium. Other minerals produced in Niger include iron ore, natron, phosphate, salt, and tin.

About 90 percent of Niger's people live by farming and herding. Niger's agricultural exports include cotton, peanuts, livestock, meat, and hides. Such crops as beans, cassava, millet, peas, rice, and sorghum are grown for food. Farmers raise cattle, oxen, goats, and camels for food, export, and transport.

Poor transportation has hampered economic development in Niger. The country has no railroads, and most of its roads are not paved. Few Nigeriens own an automobile. Trucks carry freight, and people get around by buses or on foot. Niamey has an international airport.

Niger has one daily newspaper. The government controls all communications media in the country.

History. About A.D. 1000, Tuareg people began moving south from the middle of the Sahara into what is now Niger. They eventually controlled the trade routes across the desert and south to the coast. In the 1400's, a Tuareg empire grew up around the city of Agadez.

The Songhai Empire became powerful in the 1400's. Its capital was Gao, in what is now Mali. During the 1500's, the empire conquered the Tuareg at Agadez, and controlled much of central and western Niger. In 1591, an army from Morocco captured Gao, and the empire collapsed. See **Africa** (Kingdoms in western Africa).

European explorers first arrived in Niger during the early 1800's. The French occupied parts of west Africa under agreements reached in 1885 and 1890 between the various European groups. France gained control of most of Niger by 1900. It put down a strong Tuareg resistance in 1906. Niger became part of the large French territory called French West Africa in 1922. Niger gained independence from France on Aug. 3, 1960.

Hamani Diori was elected Niger's first president. In the late 1960's and early 1970's, a severe drought struck Niger, causing widespread food shortages and other problems. In 1974, a group of army officers held by Seyni Kountché overthrew Diori's government. Kountché became president of the Supreme Council (formerly called the Supreme Military Council), which held all governing power. Kountché died in 1987, and the council chose Colonel Ali Saibou to succeed him. Niger's economy suffered during the 1980's because worldwide prices of uranium declined.

In 1992, Niger adopted a multiparty political system. Mahamane Ousmane was elected president in 1993. In January 1996, a military coup led by General Ibrahim Bare Mainassara overthrew the government. Mainassara named himself head of state. In May, voters approved a new constitution supported by Mainassara. Mainassara won a presidential election held in July, but opposition leaders claimed the election was fraudulent. In April 1999, Mainassara was assassinated, and military leaders took control of the government. In November, Niger held elections to restore civilian rule. The voters elected Mamadou Tandja as president. Robert I. Rotberg

Niger River, *NY juhr,* is the third longest river in Africa. Only the Nile and Congo rivers are longer. The Niger flows about 2,600 miles (4,180 kilometers) in western Africa. It carries more water than any other African river except the Congo. The Niger drains about 580,000 square miles (1,500,000 square kilometers) of land.

The Niger begins in the highlands of southern Guinea, near Guinea's border with Sierra Leone. The river then flows northeast into Mali, where it turns southeastward. After leaving Mali, the river cuts through the southwestern part of Niger and the northern tip of Benin. It then flows through western Nigeria, where it is joined by its main tributary, the Benue River. Near the coast of southern Nigeria, the Niger flows through a large delta region and empties into the Gulf of Guinea, an arm of the Atlantic Ocean.

Fishing and the transportation of passengers and freight are important activities on the Niger. Boats can navigate the river for about 1,000 miles (1,600 kilometers) in Mali and about 400 miles (640 kilometers) in Nigeria the year around. Rapids, waterfalls, and other obstacles prevent navigation on other parts of the Niger.

The delta region of the Niger has major deposits of petroleum. The Niger is an important source of hydroelectric power. The Kainji Dam in Nigeria is one of the largest power projects on the river. The dam, which holds back the Niger to form Kainji Lake, produces much of Nigeria's electricity.

The Scottish explorer Mungo Park became the first European to explore the course of the Niger. Park led expeditions on the river in 1796 and 1797 and in 1805 and 1806. Hartmut S. Walter

Women harvest peanuts, one of Nigeria's leading crops, at a farm in the northern part of the country. Nigeria has more people than any other country in Africa. Most Nigerians live in rural areas and earn their livelihood by farming, fishing, or herding.

Nigeria

Nigeria, *ny JIHR ee ah,* a nation on the west coast of Africa, has more people than any other country in Africa. Nigeria ranks as one of the largest countries in the world.

Nigeria is a land of great variety. It has hot, rainy swamplands; dry, sandy areas; grassy plains; and tropical forests. High plateaus and rocky mountains rise in various parts of the country. The population of Nigeria consists of more than 250 *ethnic* (cultural) groups. Most of the country's people live in rural areas. Nigeria also has several large, crowded cities. Lagos is the chief commercial center. Abuja is the capital of the country.

Most Nigerians earn their livelihood by farming, fishing, or herding. The country is a leading producer of cacao, peanuts, and other crops. In addition, Nigeria has mineral resources, including large deposits of petroleum. Since the late 1960's, profits from Nigeria's oil industry have brought new wealth to the nation. Nigeria has used this wealth to develop new industry, improve its educational system, and modernize its agriculture.

A number of ancient kingdoms developed in the area that is now Nigeria hundreds of years ago. Some of the kingdoms became important cultural and trade centers. The United Kingdom gained control of Nigeria in the late 1800's and the early 1900's. Nigeria was a British colony and protectorate until 1960, when it gained independence.

Ebere Onwudiwe, the contributor of this article, is Professor of Political Science at Central State University in Ohio.

Government

Military leaders controlled Nigeria's government from 1966 to 1979 and from 1983 to 1999. Civilian rule was restored in 1999, and a new constitution was adopted.

National government. A president heads the government of Nigeria. The president is elected by the people to a four-year term and cannot serve more than two terms. A vice president and Cabinet assist the president in handling the day-to-day operations of the government. The people elect the vice president. The president appoints members of the Cabinet with the approval of the Senate.

The National Assembly is Nigeria's legislature. The Assembly consists of the 360-member House of Representatives and the 109-member Senate. The people elect representatives and senators to four-year terms. All Ni-

Facts in brief

Capital: Abuja.
Official language: English.
Official name: Federal Republic of Nigeria.
Area: 356,669 mi² (923,768 km²). *Greatest distances*—east-west, 800 mi (1,287 km); north-south, 650 mi (1,046 km). *Coastline*—478 mi (769 km).
Elevation: *Highest*—Dimlang Peak, 6,699 ft (2,042 m) above sea level. *Lowest*—sea level.
Population: *Estimated 2002 population*—128,886,000; population density, 361 per mi² (140 per km²); distribution, 64 percent rural, 36 percent urban. *1991 census*—88,992,220.
Chief products: *Agriculture*—beans, beef and hides, cacao, cassava, corn, cotton, millet, palm oil and palm kernels, peanuts, rice, rubber, yams. *Mining*—columbite, limestone, natural gas, petroleum, tin. *Manufacturing*—cement, chemicals, clothing, food products, textiles.
National anthem: "Arise, O Compatriots."
Money: *Basic unit*—naira. One hundred kobo equal one naira.

gerian citizens who are 18 years of age or older may vote.

Local government. Nigeria is divided into 36 states and the Federal Capital Territory of Abuja. Each state is governed by a House of Assembly and a governor. Assembly members and the governor are elected by the people to four-year terms. Nigeria's 36 states are divided into over 750 local government areas. Elected local government councils administer these areas.

Courts. The Supreme Court is the highest court in Nigeria. The country's judicial system also includes federal courts of appeal, the Federal High Court, and state high courts.

Nigeria has a number of religious courts. These courts have traditionally ruled only on questions of Islamic personal law for people who are practicing Muslims. The highest such court is the Sharī`a Court of Appeal in Abuja. In the early 2000's, a number of largely Muslim northern states adopted Sharī`a (also spelled Sharī`ah), which is the body of Islamic law, as the basis of their legal codes. As a result, Sharī`a is now applied to both civil and criminal cases in those states.

Armed forces. About 70,000 people serve in the Nigerian Army. The country also has a small navy and air force, and a federal police force. All military service is voluntary.

People

Ancestry. Almost all Nigerians are black Africans. The country has more than 250 ethnic groups. These groups differ from one another in language and in some of their customs and traditions. The three largest ethnic groups are, in order of size, the Hausa, the Yoruba, and the Igbo (also spelled Ibo). These three ethnic groups account for about three-fifths of the total population of Nigeria.

The Hausa people live primarily in northern Nigeria and in the neighboring countries of Niger and Chad. Most of them are farmers, and many also are craftworkers and traders. The Hausa have lived in the area for more than a thousand years. During the 1200's, the Fulani, a people who originally came from what are now Senegal and Gambia, began to settle in the Hausa territory. The Fulani took control of the region during the early 1800's. The two peoples intermixed so much that the group is sometimes called the Hausa-Fulani.

The Yoruba live mainly in the southwestern part of the country and in Benin and Togo, two nations that lie to the west of Nigeria. Many of the Yoruba live in cities and farm the land in the surrounding countryside. Several Yoruba cities, including Lagos, were founded hundreds of years ago.

The Igbo form a majority of the population in southeastern Nigeria. In addition, a large number of Igbo live in other areas of the country. During the period of British rule in the 1900's, many Igbo accepted Western education and ways of life more quickly than the other Nigerian ethnic groups. The Igbo were also more willing to travel. As a result, the Igbo held many important positions in business and government during the period of colonial rule.

Other leading ethnic groups in the country include the Nupe and Tiv of central Nigeria; the Edo, Urhobo, and Itsekiri of the Edo and Delta states; the Ijaw of the

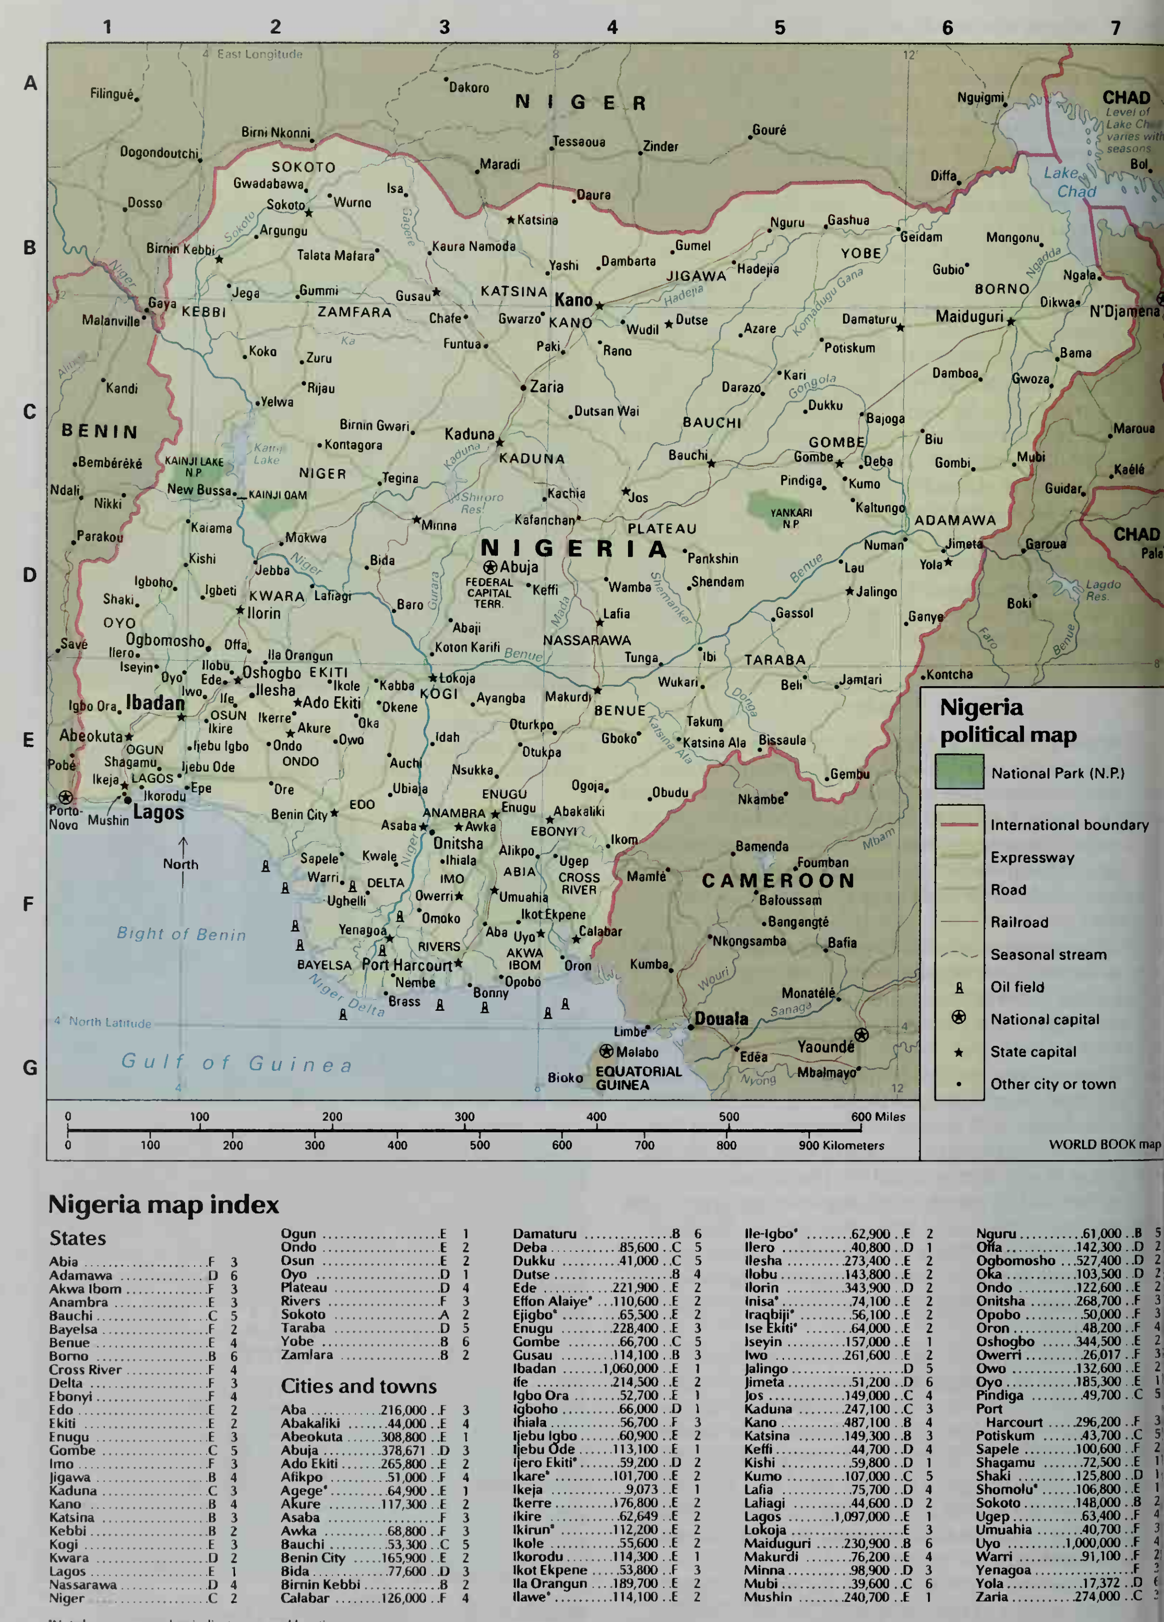
Abuja, officially the capital of Nigeria since 1991, lies in a hilly region in the central part of the country. Aso Rock, *background,* and other huge rock formations stand in or near the city.



Nigeria's flag was adopted in 1960. The green represents agriculture, and the white symbolizes unity and peace.

Coat of arms. The design on the shield stands for Nigeria's fertile soil and main rivers, the Niger and the Benue.

WORLD BOOK map

Nigeria, a large country in West Africa, lies on the Gulf of Guinea, just north of the equator.

Rivers state; the Efik and Ibibio of the Cross River State; and the Kanuri of northeastern Nigeria. The Kanuri trace their ancestry back to the ancient Kanem empire, which began during the A.D. 700's.

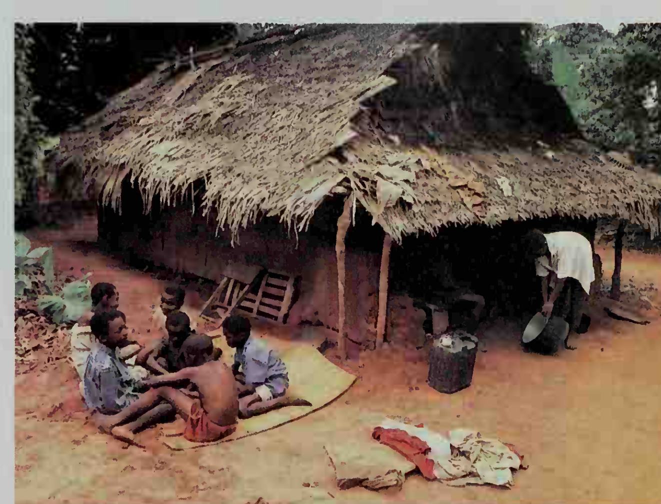
Languages. English is the official language of Nigeria and is taught in schools throughout the country. However, English is not the country's most commonly used language. Each of the more than 250 ethnic groups that live in Nigeria has its own distinct language. The three most widely used languages are those of the three largest ethnic groups—Hausa, Yoruba, and Igbo.

A majority of the people of Nigeria speak more than one language. They may use the language of their ethnic group on most occasions and speak English or another language at other times. In addition, Nigerians who are Muslims use Arabic while taking part in various religious activities.

Way of life. Most of Nigeria's people live in rural areas. Most homes in rural Nigeria are made of grass, dried mud, or wood and have roofs of asbestos cement sheets, corrugated metal, or thatch. A typical village consists of several *compounds* (clusters of houses). A group of related families lives in each compound. Well-to-do city dwellers in Nigeria live in modern houses or apartment buildings. The cities also have slums, where people live in mud huts that line unpaved streets. Overcrowding has become a serious problem in many Nigerian cities since the 1960's, when increasing numbers of people began moving from rural to urban areas in search of jobs.

In the cities, many Nigerians wear Western-style clothing. But other city dwellers and most people in rural areas wear traditional clothing. Traditional garments for men and women in Nigeria include long, loose robes made of white or brightly colored fabrics. The men may also wear short, full jackets with shorts or trousers. Small round caps are popular head coverings for men, and Nigerian women often wear scarves tied like turbans.

The chief foods of Nigeria include yams, corn, rice, and beans. The people also eat *plantains* (a kind of banana) and the roots of the cassava plant. Nigerian food is often cooked in palm oil or peanut oil, and it may be highly seasoned with red peppers. Some Nigerian meals feature beef, chicken, fish, or lamb. But in general, most Nigerians eat little meat. Popular beverages in Nigeria include beer and a wine that is made from the sap of palm trees. Some city dwellers also drink coffee and tea. Nigerian Muslims who obey the laws of Islam may not drink alcoholic beverages.



Religion. About half the people of Nigeria are Muslims. They make up the majority of the population in the north. Nearly 40 percent of the people are Christians. They live mainly in southern and central parts of Nigeria. Many Nigerians, especially in the rural areas, practice traditional religions based on the worship of many gods and spirits. People throughout the country may combine Christian or Muslim religious practices with traditional beliefs.

Education. About half of Nigeria's adults can read and write. For the country's literacy rate, see **Literacy** (table: Literacy rates). Nigeria does not have enough schools or teachers to provide an education for all school-age children, and laws do not require school at-

Music and dance are popular forms of entertainment in Nigeria. These Hausa musicians and dancers from Kano in northern Nigeria are performing in Lagos.

tendance. About 15 million children attend elementary schools in Nigeria. About 3 $\frac{1}{2}$ million students attend secondary schools. Nigeria has about 30 universities. The largest is Ahmadu Bello University, in Zaria.

Recreation. People in both urban and rural areas of Nigeria enjoy performances of traditional songs and dances. Motion pictures attract many people in the large cities, where radio and television are also popular. Soccer ranks as the favorite sport in Nigeria. Art festivals and special sports contests are held in many parts of the country.

The arts. Nigeria is famous for the variety and quality of its art. The art of Nigeria and other African countries has influenced art movements in many other parts of the world. For example, traditional African sculpture influenced Pablo Picasso and other modern Western artists.

The oldest known African sculptures are *terra-cotta* (clay) figures created by the Nok civilization in central Nigeria as early as 500 B.C. Other famous traditional sculptures include the bronze and brass figures of Benin and Ife, and the woodcarvings of the Yoruba people. Various peoples who live in the forest areas of Nigeria are known for their elaborately carved wooden masks. Most of the traditional Nigerian painting is done on sculptures and textiles, or as body decoration.

Nigerian music often features drums, xylophones, and various string and wind instruments. Dance and dramatic performances are popular forms of entertainment in Nigeria. Many of these performances portray themes from folk stories or topics related to the everyday life of the people.

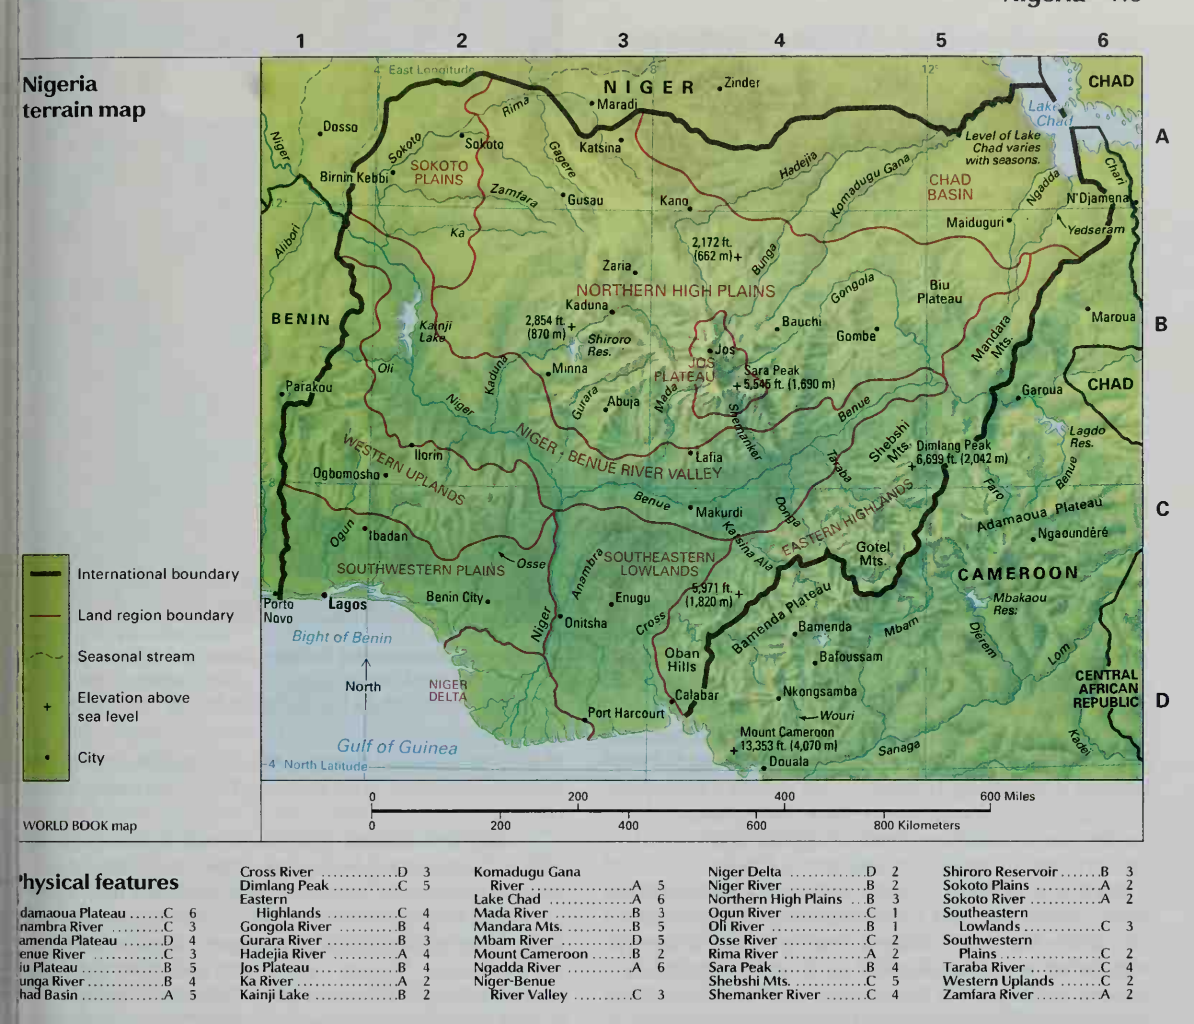
Most of Nigeria's traditional literature is oral, rather than written. Popular forms of such literature include chants, folk stories, proverbs, and riddles. During the mid-1900's, many Nigerian authors began to write novels, stories, and poetry. These works were written in English and in local languages. In 1986, Nigerian playwright, poet, and novelist Wole Soyinka became the first African writer to win the Nobel Prize in literature.

The land and climate

Land regions. Nigeria covers 356,669 square miles (923,768 square kilometers). It can be divided into 10 land regions. They are: (1) the Sokoto Plains, (2) the Chad Basin, (3) the Northern High Plains, (4) the Jos Plateau, (5) the Niger-Benue River Valley, (6) the Western Uplands, (7) the Eastern Highlands, (8) the Southwestern Plains, (9) the Southeastern Lowlands, and (10) the Niger Delta.

The Sokoto Plains occupy the northwestern corner of Nigeria. Several rivers flow across the flat, low-lying plains and flood the area during the rainy season. The floodwaters deposit fertile soil that allows farmers to grow various crops in the area. But the floods also occasionally destroy homes and farms.

The Chad Basin extends across northeastern Nigeria, south and west of Lake Chad. Sandy ridges cut across parts of the low-lying basin. During the rainy season, parts of the region become swampy. But long dry spells occasionally cause serious droughts in the region. Short grasses and thinly scattered trees grow in the Chad Basin.



The Northern High Plains cover almost a fifth of Nigeria's total area. They consist largely of flat grasslands, with a few hills and granite ridges. Most of the plains area has an elevation of about 2,500 feet (762 meters) above sea level.

Several branches of the Niger River have their source in the Northern High Plains. These branches include the Gongola, Sokoto, and Kaduna rivers. They flow gently across the plains and form beautiful waterfalls as they tumble into deep gorges in parts of the region.

© James Morris, Panos Pictures

The Niger River serves as a major transportation route in Nigeria. The river flows southward through west-central Nigeria and cuts through grassland, tropical forests, and swampy plains. It empties into the Gulf of Guinea, an arm of the Atlantic Ocean.

The Jos Plateau lies near the center of Nigeria. It rises harply from the surrounding plains. Parts of the region e more than 5,000 feet (1,500 meters) above sea level.)airy cattle graze on the plateau's grasslands, and the rea also has important tin mines.

The Niger-Benue River Valley forms an arc across entral Nigeria, from east to west. The Niger River flows outheastward from Benin through west-central Nigeria. 'he Benue River cuts across east-central Nigeria. The wo rivers meet near the center of the country and flow outhward to the Niger Delta. Grasslands, palm forests, nd swampy plains cover parts of the valley. Other areas re marked by rugged, rocky hills.

The Western Uplands, also known as the Plateau of 'orubaland, lie about 1,000 to 2,000 feet (300 to 610 meers) above sea level in west-central Nigeria. Domehaped granite hills dot the grassy plains of the uplands.

The Eastern Highlands stretch along the easternborler of Nigeria. They consist of plateaus and low, rocky nountains and hills. Much of the region is more than ,000 feet (1,200 meters) above sea level. Dimlang Peak, ne highest point in Nigeria, rises 6,699 feet (2,042 meers) above sea level in the Shebshi Mountains.

The Southwestern Plains consist of a heavily forested rea that slopes gently northward from the Gulf of Guinea, an arm of the Atlantic Ocean. Swamps and lagoons cover much of the coastal region. Lagos, the largest city of Nigeria, occupies several islands in the Lagos Lagoon.

The Southeastern Lowlands resemble other parts of southern Nigeria, with swamps and forested plains covering much of the region. In the northwestern part of this region, however, steep-sided plateaus rise to about 1,000 feet (300 meters) above sea level.

The Niger Delta forms the southernmost region of Nigeria, along the Gulf of Guinea. It consists of deposits of clay, mud, and sand at the mouth of the Niger River. Lagoons and mangrove swamps cover much of the region. This area is also the site of Nigeria's important petroleum deposits.

Climate. Most of Nigeria has a tropical climate, with warm temperatures throughout the year. The north is generally hotter and drier than the south. The average annual temperature in the north is about 85 °F (29 °C), but daily temperatures may rise above 100 °F (38 °C). The average annual temperature in the south is about 80 °F (27 °C).

Southern Nigeria receives far more rainfall than the northern part of the country. The coastal areas of Nigeria have an average annual rainfall of about 150 inches (381

centimeters). Parts of the north receive only about 25 inches (64 centimeters) of rainfall annually. The rainy season lasts from April to October in most parts of Nigeria, though it usually extends for a longer time in the south.

Economy

Nigeria has a developing economy based on agriculture and mining. Agriculture employs about two-thirds of all Nigerian workers, but it accounts for only about one-fifth of the total value of Nigeria's economic production. Since the late 1960's, the development of the oil industry has made mining the fastest-growing part of the economy. In the early 1960's, mining accounted for less than 2 percent of the value of economic production. Today, it accounts for about 70 percent of the value of production, and revenue from oil exports provides the government with its chief source of income.

Nigeria's factories produce a wide variety of goods. However, manufacturing employs only about 10 percent of the country's work force. Manufacturing also accounts for less than 10 percent of the value of Nigeria's economic production.

The federal and state governments of Nigeria control communication, transportation, and electric power production. Most businesses and industries are privately owned, but the federal government shares in the ownership of some.

Natural resources. Nigeria has a variety of natural resources. More than half of Nigeria's land is suitable for farming and grazing. However, only about 15 percent of the country's total area is used for growing crops. Forests cover about one-third of Nigeria. Lakes, rivers, and streams provide an abundance of fish.

Petroleum ranks as Nigeria's most valuable natural resource. Large oil fields lie in southwestern Nigeria and offshore in the Gulf of Guinea. The Jos Plateau of central Nigeria has important deposits of tin and columbite, a mineral that is used in the production of certain kinds of steel. Other important natural resources include coal, iron ore, lead, limestone, natural gas, and zinc.

Agriculture. Nigeria ranks among the world's leading producers of cacao, palm oil and palm kernels, peanuts, and rubber. The country's other important crops include beans, cassava, corn, cotton, millet, rice, sorghum, and yams. Farmers throughout Nigeria raise goats, poultry, and sheep. Cattle are raised primarily in the north. Nigerian fishing crews catch shrimp and a variety of other seafoods.

Farms in Nigeria average only about 2 $\frac{1}{2}$ acres (1 hectare) in size. Most of the farmers use old-fashioned tools and methods. The government sponsors programs to distribute fertilizer, insecticides, and new varieties of seeds to farmers.

Mining. Nigeria ranks as one of the world's leading exporters of petroleum. Foreign oil companies operate most of the petroleum wells, but they pay the Nigerian government more than half their profits. In 1971, the government of Nigeria established a national oil corporation to explore for and produce oil. In addition to petroleum, Nigeria produces coal, columbite, gold, iron ore, lead, limestone, natural gas, tin, and zinc.

Manufacturing. Leading industries in Nigeria produce cement, chemicals, clothing, fertilizers, food products, leather goods, lumber, metal products, and textiles.

© Eric Miller, Lauré Communications

An oil worker steadies a drilling pipe at an oil platform off the coast of southern Nigeria. Nigeria is a world leader in the production of petroleum, its most valuable natural resource.

The country also has motor vehicle assembly plants, petroleum refineries, steel mills, and factories that process rubber.

Transportation and communication. Railroads and paved roads link Nigeria's major cities. But many of the country's roads are unpaved and rutted. Less than 1 percent of all Nigerians own an automobile. Buses and taxis—often jammed with passengers—operate along the main roads. Nigeria's chief ports are Lagos and Port Harcourt. Abuja, Kano, and Lagos have the country's largest airports. Nigeria Airways provides domestic and international service.

More than 20 daily newspapers, representing a variety of political opinions, are published in Nigeria. The national and state governments operate radio and television systems that broadcast in more than a dozen languages. The country also has several private radio and television stations. Nigeria has an average of about 1 radio for every 6 people and 1 TV set for every 50 people.

International trade. Petroleum accounts for more than 90 percent of the total value of Nigeria's exports. Nigeria belongs to the Organization of Petroleum Exporting Countries (OPEC), an association of countries whose economies depend heavily on oil exports. In addition to oil, Nigeria exports cacao beans, rubber, timber, and tin. Chief imports include cement, chemical products, food products, machinery, manufactured goods, and textiles. Nigeria's most important trade partners are Brazil, France, Germany, Japan, the Netherlands, South Korea, the United Kingdom, and the United States.

History

People lived in what is now Nigeria thousands of years ago. In parts of Nigeria, archaeologists have found stone tools that are 40,000 years old. Human skeletons,

rock paintings, and other remains of prehistoric settlements have also been found.

The Nok civilization flourished in what is now central Nigeria from about 500 B.C. to A.D. 200. The clay figures of animals and people produced by this civilization are among the oldest known examples of African sculpture.

Early kingdoms. The kingdom of Kanem developed in about the A.D. 700's in what is now Chad. Beginning in the 1000's, Kanem adopted Islam as its religion and gradually expanded its territory. By the 1300's, Bornu (now called Borno), in what is now northeastern Nigeria, had become the political center of the kingdom. The Kanem-Bornu kingdom traded with countries in Africa, Asia, and Europe.

After about A.D. 1000, a number of Hausa states grew up in the region west of Bornu. Some of these states, such as Kano and Katsina, traded with other countries in North Africa and the Middle East. Kano, Kebbi, and some other Hausa states became part of the Songhai Empire, a west African state that flourished during the 1400's and 1500's. During the early 1800's, Usman dan Fodio (also called Uthman ibn Fudi), a Fulani who was a Muslim religious leader, declared war on the Hausa states. His forces gained control of almost all northern Nigeria except Bornu. He turned the area into a Muslim empire called the Sokoto Caliphate.

In the south, the Yoruba people had established an important cultural center at Ife as early as the mid-900's. Yoruba rulers from Ife later founded states in various parts of the surrounding territory. The most important of these was the kingdom of Oyo, which extended into what is now the country of Benin during the 1700's.

The kingdom of Benin flourished from the early 1400's to the 1800's. It developed between Lagos and the Niger Delta and grew into a prosperous trade center. The kingdom also became famous for its sculptures of brass, bronze, and ivory.

The coming of the Europeans. The Portuguese were the first Europeans to reach Nigeria. They established a trade center near Benin in the late 1400's and developed a trade in slaves with the African leaders. British, Dutch, and other European traders later competed for control of the trade. By the 1700's, the British were the leading slave traders on the Nigerian coast.

In 1807, the British government outlawed the slave trade. The United Kingdom signed treaties with other European countries and with local African rulers in an attempt to end the trade. British ships sailed along the Nigerian coast and captured ships that carried slaves. The British then set the slaves free at Freetown in Sierra Leone. British missionaries converted many of the freed slaves to Christianity. Some of the freed slaves later returned to Nigeria and helped spread Christianity along the coastal areas and in the southwest.

British rule. After 1807, British traders began to deal in palm oil and other agricultural products of the Nigerian coastal region. They explored the Niger River and other waterways in search of valuable natural resources. In 1851, the United Kingdom seized the port of Lagos to increase its influence over the area. Lagos served as a base from which the British continued their war against the slave trade. Lagos became a British colony in 1861.

During the late 1800's, the United Kingdom established protectorates in parts of southern Nigeria. A British trading firm called the Royal Niger Company ruled most of northern Nigeria until 1900. That year, the British government made the region the Protectorate of Northern Nigeria. In 1906, all of southern Nigeria, including Lagos, became the Colony and Protectorate of Southern Nigeria. Nigerians in many areas, especially in the north, fought unsuccessfully against the establishment of British rule. In 1914, the United Kingdom joined the northern and southern regions into one unit—the Colony and Protectorate of Nigeria.

Independence. During the 1920's, Nigerians began to demand representation in the British colonial government. In the 1940's, their demands began to be met.

In 1946, the United Kingdom divided Nigeria into three regions—north, west, and east. Each region had an assembly composed of Nigerian and British members. The assemblies acted as advisory bodies to the central government in Lagos. A Constitution adopted in 1954 gave the assemblies increased powers and established Nigeria as a federation. Abubakar Tafawa Balewa, a northern leader, became the federation's first prime minister in 1957. On Oct. 1, 1960, the United Kingdom granted Nigeria independence. Balewa remained prime minister. Nnamdi Azikiwe, a political leader from the eastern part, became the first person to hold the ceremonial office of president of Nigeria.

In 1961, the United Nations (UN) organized a referendum in western Cameroon, a UN trust territory that bordered Nigeria on the east. As a result of the referendum, the northern part of the territory joined Nigeria, and the southern part joined Cameroon.

During the early 1960's, various ethnic groups competed for political power within Nigeria's three regions. In 1963, a Mid-Western Region was created out of the Western Region. Some people in the Northern and Eastern regions also demanded separate political units.

At the same time, the different groups competed for control of the central government. The people of southern Nigeria, especially the Igbo, resented the power of the Hausa people of the north. The northerners controlled the central government because the north had more people than the other regions. Censuses conducted in 1962 and 1963 showed that the north had an even

Important dates in Nigeria

c. 500 B.C.-A.D. 200 The Nok civilization thrived in what is now central Nigeria.

c. A.D. 1000-1400's Various kingdoms, including Benin, Kanem-Bornu, Ife, and the Hausa states, began to develop in different parts of Nigeria.

Late 1400's The Portuguese became the first Europeans to reach Nigeria.

1851 The British seized control of Lagos.

1914 The British formed the Colony and Protectorate of Nigeria.

1960 Nigeria became independent.

1966 In January, military leaders overthrew Nigeria's government. In July, a second revolt established a new military government in Nigeria.

1967-1970 Nigeria's Eastern Region declared itself an independent republic called Biafra. Biafra and the rest of Nigeria fought each other in a civil war until Biafra surrendered in 1970.

1979 Civilian rule was restored in Nigeria.

1983 Military leaders took control of Nigeria's government.

1999 Nigeria returned to civilian rule.

AP/Wide World

An independence ceremony attended by representatives of the United Kingdom marked the opening of Nigeria's parliament. Nigeria gained independence from the United Kingdom in 1960.

larger population than had been expected. Many southerners protested against the census figures. Charges of dishonesty in a 1964 federal election and a 1965 regional election led to violent riots and added to the turmoil.

Civil war. In January 1966, a group of Army officers, mainly Igbo, overthrew the central and regional governments. They killed Prime Minister Balewa and the prime ministers of the Northern and Western regions. General Johnson Aguiyi-Ironsi, commander of the Army and an Igbo, took control of the government. In May, he abolished the federal system of government. He set up a strong central government and appointed many Igbo as advisers. Many northerners feared that these actions would give the Igbo control over the nation. Riots broke out in the north, and thousands of Igbo were killed.

In July 1966, a group of northern Army officers revolted against the government and killed Aguiyi-Ironsi. Yakubu Gowon, the Army chief of staff, became head of a new military government. But Colonel Odumegwu Ojukwu, the military governor of the Eastern Region, refused to accept Gowon as head of state.

In 1967, Gowon replaced the country's 4 political regions with 12 states to give some of the smaller ethnic groups more political power. Ojukwu refused to accept the division of the Eastern Region into 3 states. On May 30, 1967, he declared the Eastern Region an independent republic called Biafra. Civil war between Biafra and the rest of Nigeria broke out in June 1967. Biafra surrendered in January 1970. The civil war caused widespread death and destruction in southeastern Nigeria. Beginning in 1970, the government sponsored reconstruction and relief programs to overcome the effects of the war. Many Igbo, including some who had fought with rebel forces, were given government positions.

Oil wealth. During the early 1970's, Nigeria's growing oil industry provided the country with an important source of wealth. Oil profits enabled the government to plan development programs to improve the standard of living of all Nigerians. Major goals included the establishment of manufacturing industries, new schools, and improved transportation facilities. But political problems continued in Nigeria. In 1975, military leaders overthrew General Gowon. General Murtala Ramat Muhammad became head of state and commander in chief of Nigeria's armed forces. In 1976, a group of military officers tried to overthrow the government. They failed, but killed General Muhammad. Lieutenant General Olusegun Obasanjo succeeded him. Also in 1976, Nigeria increased its number of states from 12 to 19. Military rule ended in 1979. The people elected a new civilian government to replace the military government. Shehu Shagari became president. He was reelected in 1983.

The wealth that Nigeria gained from its oil exports in the 1970's attracted many people from neighboring lands. These people came to Nigeria to find work. But in the early 1980's, declining oil prices began to hurt Nigeria's economy. In 1983 and again in 1985, the government ordered foreigners who were living in Nigeria illegally to leave the country. Many people from Ghana and other countries were required to leave Nigeria.

In 1980, Nigeria's government began building a new city, Abuja, near the country's center to replace Lagos as the capital. Abuja became the official capital in 1991.

Recent developments. In December 1983, the military overthrew the civilian government. Major General Muhammadu Buhari became head of a new military government. In 1985, he was overthrown by other military leaders. Major General Ibrahim Badamosi Babangida became government head. He announced that Nigeria would return to civilian rule. The government formed two political parties in 1989. Elections for a new National Assembly occurred in 1992. Elections for a civilian president were held in June 1993. But Babangida canceled the presidential election results, charging that the voting had been dishonest. Many Nigerians rioted in protest.

In November 1993, General Sani Abacha overthrew the Interim National Government that Babangida had set up in the summer. That government was headed by a civilian, Earnest Shonekan. Abacha made himself head of state and commander in chief of the armed forces. He dissolved the National Assembly, outlawed political parties, and dismissed all elected local government officials. In 1995, he ended the ban on political parties. In 1996, Nigeria increased the number of its states to 36.

Abacha died in June 1998. General Abdulsalami Abubakar became president. In 1999, Nigeria held elections for the National Assembly and presidency and adopted a new constitution. Olusegun Obasanjo, who as a military ruler had ceded power to a democratically elected government in 1979, was elected president as a civilian.

Since 1999, ethnic, religious, and political tensions in Nigeria have sparked several outbreaks of violence in which thousands of people have died. Many conflicts have been over access to land or other scarce resources. The adoption of Shari'a (Islamic law) in several northern Nigerian states has led to clashes between Muslims and Christians. Ebere Onwudiwe

Night. See Day.

Night vision systems are electronic devices used by nilitary forces to detect and track targets at night. Police officers and hunters also use these devices.

Lon Harding, Litton Industries, Inc.

Night vision goggles help a soldier see at night. The goggles nagnify starlight and moonlight reflected by objects to produce ın image of the objects.

The most advanced night vision system is the *Forward-Looking Infrared* (FLIR) system, developed in the ate 1960's. The FLIR uses a technique called *thermal imaging,* which detects and records minute temperature variations. The FLIR converts the temperature readings nto electrical signals that generate a clear, black-and-white video image in which hot areas appear bright and cold areas appear dull. FLIR systems cannot be easily detected. When combined with powerful lenses, these systems have an extended range, and they perform relatively well even in bad weather or smoky conditions.

The first night vision systems used special searchlights that sent out infrared rays to illuminate an area. The infrared rays were invisible except when viewed hrough a special filter. Infrared systems were easily detected. They had a limited range, and they did not work well in bad weather or smoky conditions.

In the early 1960's, *image intensifying systems* (sometimes called *starlight scopes)* were introduced. These systems have special tubes that magnify the starlight and noonlight reflected by objects and then focus the light on a viewing screen to produce an image.

WORLD BOOK illustration by John Rignall, Linden Artists Ltd.

The nighthawk often flies in urban areas during the evening, hunting for insects that are attracted by the city lights.

Nighthawk, also called *bullbat* and *mosquito hawk,* is a bird that looks much like the whippoorwill, to which it is related. It is not a hawk. The nighthawk measures about 10 inches (25 centimeters) long. It has mixed brown, black, and white feathers, and a white throat patch. It has a white bar on each wing. Soon after sunset, the nighthawk flies to look for insects. It breeds throughout most of the United States and Canada. In winter, it is found in South America. The female lays two speckled eggs on the ground or on gravel rooftops.

Bertin W. Anderson

Scientific classification. The nighthawk belongs to the nightjar family, Caprimulgidae. The eastern nighthawk is *Chordeiles minor.*

Nightingale is a small, dull-colored bird famed for its beautiful, sad song. The bird belongs to the thrush family. It lives in central and western Europe for most of the year, but it spends winters in Africa.

The nightingale grows about 6 to 7 inches (15 to 18 centimeters) long. The upper parts of its body are russet-brown in color, and the underparts are predominantly grayish-white. The bird has a rounded tail. Its relatively long legs are well suited to traveling on land.

Nightingales usually live in dense woodland undergrowth and along streams in swampy thickets or hedges. They normally feed on insects and worms.

Jose Luis G. Grande, Photo Researchers

The nightingale is a small thrush known for its melancholy song. Nightingales nest in thickets or hedges near the ground.

When searching for food, the birds hop rapidly along the ground for a few moments and then stand motionless to listen for prey. Their songs are heard most often during spring or summer, usually in the early morning or late evening. Sometimes the songs last well into the night. The songs vary in their notes and may include imitations of other bird calls.

Nightingales usually have one brood of young each year. They build a nest near the ground in dense thickets or hedges. The female lays four to six olive-brown eggs. Both parents care for the young. Donald F. Bruning

Scientific classification. The nightingale belongs to the thrush subfamily, Turdinae, in the family Muscicapidae. The scientific name of the nightingale is *Luscinia megarhynchos.*

Nightingale, Florence (1820-1910), was the founder of the nursing profession as we know it today. British soldiers who were wounded in the Crimean War called her "The Lady with the Lamp" when she walked the halls of their hospital at night. The light that Nightingale carried has come to mean care for the sick, concern for the welfare of the ordinary soldier, and freedom for women to choose their own work.

Early years. Florence Nightingale was named for Florence, Italy, where she was born on May 12, 1820, while her wealthy British parents were living abroad. Her childhood was spent on the family estates in England with her mother, father, and sister Parthenope. The girls' mother, Frances, taught her daughters the social graces and how to run a large household. Their father, William, tutored them in languages, history, and philosophy.

At the age of 16, Florence thought she heard the voice of God telling her she had a special mission in life. She suspected this mission had something to do with helping other people. Florence had always enjoyed caring for the babies of her parents' visitors and for sick farmers on her father's estates.

Nightingale followed her own sense of purpose by turning down suitors, declining many parties, and spending much time studying health and reforms for the poor. Her mother could not accept such behavior, which was not considered proper for a wealthy young woman.

Her family's opposition initially prevented Nightingale from working in a hospital. She took a step toward independence when she entered the Institution of Deaconesses, a Protestant school for training nurses, in Kaiserswerth, a town near Düsseldorf, Germany. She later studied in Paris. At 33, she became superintendent of a women's hospital in London.

Service in Crimea. Britain and France went to war with Russia in the Crimea, now part of Ukraine, in 1854. The British people were angry when they heard that their troops had been sent to battle without enough supplies, to die under terrible conditions. The secretary of war asked Florence Nightingale to take charge of nursing. She sailed for the Crimea with 38 nurses.

Nightingale and the other nurses stepped ashore in the mud of Scutari, across from Constantinople (now Istanbul), in late 1854. They faced a job that seemed impossible. Wounded troops had just arrived from the Battle of Balaklava, where the charge of the "Light Brigade" had taken place. About 250 of the British cavalrymen had been killed or wounded in the battle in 20 minutes.

The hospital was an old Turkish barracks, rat-infested, dirty, and poorly furnished. Many of the wounded lay on floors, bleeding and neglected. There were not enough cots, mattresses, or bandages, and no washbasins, soap, or towels. Nightingale found a few men well enough to clean the place, and she put them to work at once. She set up a nursing schedule for patient care and work. At night, her lamp burned as she walked the miles of corridors or wrote countless reports and letters demanding supplies from British military officials. When the hospital was running smoothly, she started classes to teach convalescent soldiers to read and write.

At first, doctors and officials resented the "dictatorship of a woman." But they eventually came to respect her tireless efforts and professional skills.

While on a visit to the front lines, Nightingale became seriously ill and nearly died. By that time, she had become famous, and even Queen Victoria kept an anxious watch on her recovery.

Brown Bros

Florence Nightingale, *above,* introduced sanitary methods of nursing in wartime. In a hospital in Scutari, she attended to the needs of British soldiers wounded in the Crimean War, *left.*

After she returned to the Scutari hospital, Nightingale was urged to go to England to get her strength back. She replied firmly that she was "ready to stand out the war with any man." Nightingale's success at Scutari became so widely recognized that she was given charge of all the British Army hospitals in the Crimea. By the end of the war, Nightingale had saved many lives and had brought about worldwide reforms in hospital administration and in nursing.

Return to England. England greeted her arrival in 1856 with big celebrations. Instead of attending them, Nightingale went quietly home to her family, and then moved to London. The strain of overwork and her Crimean illness had injured her health. Nightingale became a semi-invalid and seldom left her rooms. Instead, the world came to her.

Ministers, heads of government, authors, reformers, and politicians came to ask her advice. Nightingale's report of over 1,000 pages to the British War Department brought about the formation of the Royal Commission on the Health of the Army in 1857. By correspondence and constant reading, she made studies of health conditions in India. Another Royal Commission was appointed in 1859, resulting in the establishment of a Sanitary Department in India in 1868.

In 1860, Nightingale used donations of about $222,000 to found the Nightingale Training School for Nurses at St. Thomas's Hospital in London. She became a world authority on scientific care of the sick. The United States asked Nightingale's advice for setting up military hospitals during the American Civil War (1861-1865). Nightingale received many honors and was the first woman to be given the British Order of Merit.

Nightmare is a frightening dream or dreamlike experience that awakens a sleeper. After awakening from most nightmares, the sleeper can recall the dream that caused the fright. Another kind of frightening sleep event, called a *night terror,* occurs without a true dream. The sleeper awakes terrified early in the night, often with a feeling of pressure on the chest. Night terrors occur during the first hours of sleep. True nightmares occur later, during *dreaming sleep* (see **Sleep** [What happens during sleep]).

Nightmares may occur in times of severe tension. They have been experienced by many soldiers in combat and by persons withdrawing from alcohol or certain other drugs. All children between the ages of 2 and 6 probably have some nightmares. Some nightmares seem entirely real to a youngster after awakening. Most adults do not have nightmares. Frequent nightmares among older children or adults may indicate a physical or emotional problem. Ernest Hartmann

Tomatoes

Various species in the nightshade family are grown for food. These include the potato, tomato, eggplant, capsicum (red, chili, and bell peppers), and such tropical species as naranjilla and tree tomatoes. The family includes some poisonous and medicinal plants, such as henbane, jimson weed, and belladonna, which is also called deadly nightshade. Several species in the family are a commercial source of such *alkaloids* as atropine, hyoscyamine, nicotine, and scopolamine (see **Alkaloid**). Other species are an important source of food for many wild animals. The petunia, a garden flower, and the tobacco plant also belong to the family.

Superstitions and folklore surround many plants in the family. Europeans once associated some species with witchcraft. In the 1500's, many people believed tomatoes and potatoes were poisonous. John E. Averett

Nihilism, *NY uh lihz uhm,* is the name used for a variety of extreme, negative philosophical and political views. The term *nihilism* comes from a Latin word meaning *nothing.* The most radical nihilist would deny that anything exists. A slightly less radical view, usually called *skepticism,* denies that anything can be known.

Nihilism is most commonly understood as the view that no absolute values exist. The Russian author Fyodor Dostoevsky challenged this view in his novel *The Brothers Karamazov* (1879-1880). He wrote that if no God exists, then everything is permitted. He argued that belief in God is necessary for believing in any absolute values.

The term *nihilist* first came into popular use during the mid-1800's in Russia. It applied to radical opponents

of the czar, some of whom committed terrorist acts against the government. Used more broadly, *nihilism* referred to any extreme challenge to authority. Ivan Turgenev portrayed a nihilist in his novel *Fathers and Sons* (1862). This character believes in reason and a scientific conception of the world, but he rejects traditional religious beliefs and moral values. Stephen Nathanson

Nijinsky, *nih ZHIHN skee* or *nih JIHN skee,* **Vaslav,** *vahts LAHF* (1890-1950), was the most famous male dancer of his time. He was short, with thick thighs and sloping shoulders. Yet he acted out his roles so completely that his appearance seemed to change from one role to another.

Nijinsky had such amazing body control that his dancing looked spontaneous and effortless. One legend tells of a dramatic leap he made through an open window as his exit in *Le Spectre de la Rose.* Nijinsky rose slowly, soared across the window ledge, appeared to stop in midair, and was still at the height of his jump as he disappeared.

Nijinsky was born in Kiev, Ukraine (then a part of the Russian Empire). He first studied dancing at the St. Petersburg Imperial School of Ballet in 1898. He traveled with Sergei Diaghilev's ballet company to Paris in 1909 and had great international success until 1913. He married a ballet student with the company in 1913, and Diaghilev dismissed him. Nijinsky rejoined the company in the United States in 1916, dancing as brilliantly as ever. But in 1917, mental illness ended his career.

Vaslav Nijinsky created the choreography and also danced the part of the faun in *The Afternoon of a Faun* in 1912.

Nike, Temple of. See Acropolis.

Nike of Samothrace. See Winged Victory.

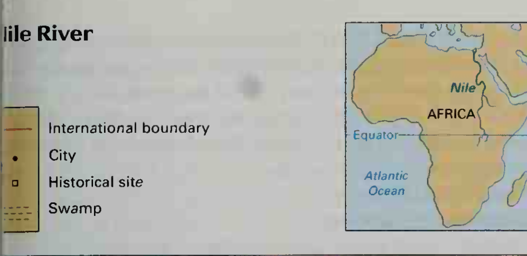
Nikolais, *NEE koh ly,* **Alwin** (1912-1993), was an American *choreographer* (creator of dances). His works are clever combinations of human movement, costumes, lighting, props, and scenery. Nikolais designed such visual elements of a performance and also composed the music.

Nikolais's dances do not tell a story. Instead, they consist of continually changing and unusual visual images. For example, in *Masks, Props, and Mobiles* (1953), the dancers are enveloped by elastic bags and thus become strange, humanlike shapes.

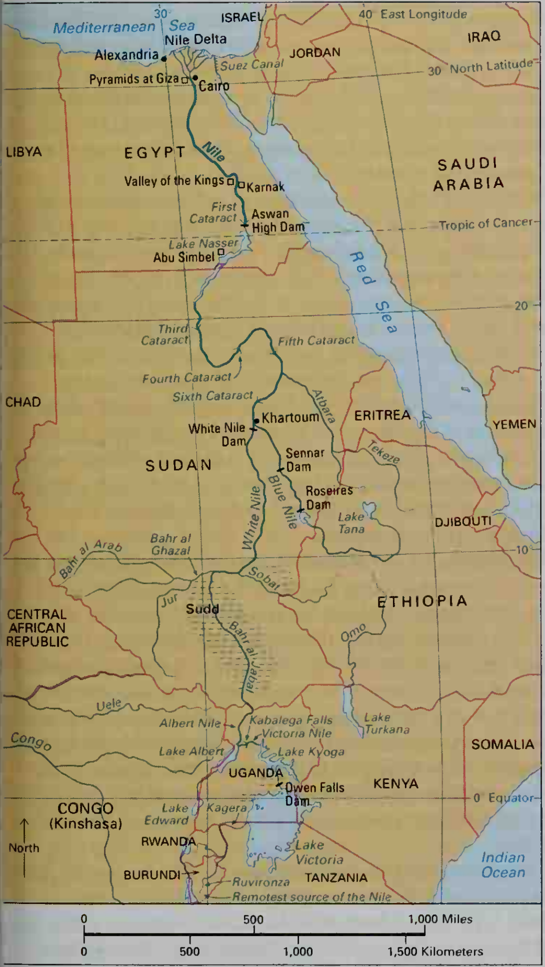
Nikolais was born in Southington, Connecticut. In the 1940's, he studied with the German dancer Hanya Holm. From 1948 to 1970, he headed the dance department of the Henry Street Playhouse in New York City. About 1950, he formed his own dance company.

In 1989, Nikolais and dancer Murray Louis combined their dance companies to form Nikolais-Louis Dance. Nikolais's major works include *Kaleidoscope* (1956), *Totem* (1960), *Imago* (1963), *Triad* (1976), and *Crucible* (1985). Katy Matheson

Nile River is the longest river in the world. It flows for 4,160 miles (6,695 kilometers) through northeast Africa. The Nile rises near the equator and flows into the Mediterranean Sea. The Nile irrigates about 6 million acres (2.4 million hectares) of land in Egypt and about 2 $\frac{3}{4}$ million acres (1.1 million hectares) in Sudan.



The Nile Valley and the Nile Delta rank among the world's most fertile farming areas. Until 1968, water from the Nile deposited fertile *silt* (particles of soil) in the valley and on the delta, where the Nile flows into the Mediterranean. The Nile also flooded certain areas every summer.

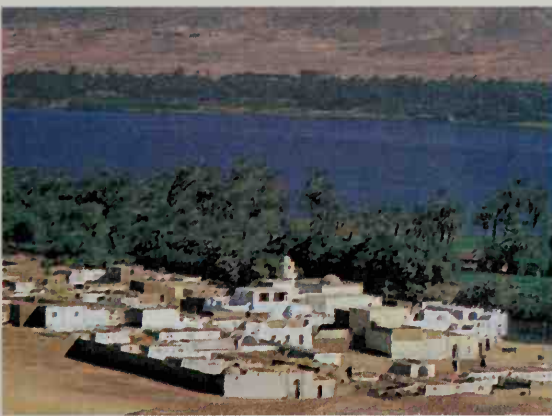


In 1968, the Aswan High Dam at Aswan, Egypt, began operating. This dam ended the annual floods and trapped the Nile's silt in Lake Nasser, behind the dam. Without the deposits of silt, Egyptian farmers had to use more artificial fertilizers on their soil. But the high dam and other dams built during the 1900's generate electric power and provide a steady flow of water for irrigation.

The course of the Nile. The Nile flows generally northward throughout its course. Its southernmost source is the Ruvironza River in Burundi. Lake Victoria ranks as the Nile's largest source. The Nile flows through the Sudd, a vast swamp in southern Sudan, where high temperatures cause about half of the water to evaporate.

The Nile is called the White Nile between the Sudd and Khartoum, Sudan. At Khartoum, the Blue Nile from Ethiopia joins the White Nile. North of Khartoum, the waterway is called simply the Nile. The Atbara River, which is another chief source of the Nile, drains into it in Sudan, about 175 miles (282 kilometers) north of Khartoum.

About 70 percent of the Nile's water comes from the Blue Nile. The flow of water in the Blue Nile and the At-



WORLD BOOK maps

ara varies greatly. Flooding by these rivers caused the nnual floods of the Nile in Egypt.

North of Cairo, Egypt, the Nile divides into separate hannels in the Nile Delta. The delta has some swampy and and salty lakes, as well as highly fertile soil.

The Nile Valley and Nile Delta make up a total of bout 3 percent of Egypt's area. Almost all Egyptian arms lie in this densely populated region. Water from he Nile enables farmers in the valley and delta to raise various crops the year around. The chief winter crops, n order of area planted, include clover, wheat, and eans and other vegetables. The main summer crops re cotton, corn, rice, and millet. Cotton is Egypt's most mportant crop financially. Hartmut S. Walter

Nilsson, Birgit (1918-), is a celebrated Swedish dramatic soprano. She became noted for the power and clarity of her voice. Critics generally regard Nilsson as one of the finest singers of heroic roles in the operas of Richard Wagner. Her performances as the Wagnerian heroines Isolde and Brünnhilde set the standard for her time. Nilsson also achieved fame in the roles of Aida, Lady Macbeth, Salome, and Tosca. However, a large number of critics rate Nilsson's performance in the title role of Giacomo Puccini's *Turandot* as her outstanding achievement.

Nilsson was born in Vastra Karup, near Malmö. She made her opera debut in 1946 as Agathe in Carl Maria von Weber's *Der Freischütz* at the Royal Opera of Stockholm. She first appeared at the Metropolitan Opera in New York City in 1959 as Isolde. Nilsson's recordings are considered masterpieces of dramatic soprano singing.

Nimitz, *NIHM ihts,* **Chester William** (1885-1966), served as commander in chief of the United States Pacific Fleet during World War II (1939-1945). He took command on Dec. 31, 1941, about three weeks after the fleet had been almost completely disabled in the Japanese attack on Pearl Harbor.

Admiral Nimitz painstakingly rebuilt U.S. strength in the Pacific. As commander of the Pacific Fleet and the Pacific Ocean Areas, he directed the Navy and the Marine Corps forces. His calm assurance of final victory helped restore the faith of the Navy in its own power and ability.

In the early months of the war, Admiral Nimitz refused to attack before U.S. forces were fully ready, in spite of angry questions from Congress and newspapers. He waited until he had enough ships, supplies, and troops to assure victory. Nimitz developed much of the strategy of *island hopping* (seizing only key islands from which attacks on other key islands could be launched). This strategy saved lives and time. Nimitz led the fleet through many victories until it drove the Japanese back to Japan. He was promoted to fleet admiral in 1944. Nimitz signed for the United States at the Japanese surrender ceremonies in Tokyo Bay in 1945.

After the war, Nimitz became chief of naval operations. He left active duty in 1947, and then became special assistant to the secretary of the Navy. Nimitz headed the United Nations commission that mediated the dispute over Kashmir in 1949. Nimitz was born in Fredericksburg, Texas, and graduated from the U.S. Naval Academy in 1905. Donald W. Mitchell

Ninety-Five Theses. See **Luther, Martin.**

Nineveh, *NIHN uh vuh,* was the last capital of the ancient Assyrian Empire. It stood on the east bank of the Tigris River, about 230 miles (370 kilometers) north of present-day Baghdad. The site was settled at least as early as 5000 B.C. In 612 B.C., Babylonians and Medes captured and destroyed the city. In the 1800's, archaeologists unearthed the site and found the great library of King Ashurbanipal. This library included business documents, letters, and examples of Babylonian and Sumerian literature. Norman Yoffee

Ning-po. See **Ningbo.**

Ningbo, *nihng bwah* (pop. 3,350,851), also spelled *Ning-po,* is an industrial center and port in the Chinese province of Zhejiang. For location, see **China** (political map). In 1842, Ningbo became one of five Chinese "treaty ports" in which Britain won special trading rights (see **China** [Clash with the Western powers]). The city produces industrial equipment. Its factories use iron from nearby mines. Parris H. Chang

Niobe, *NY oh bee,* was a queen in Greek mythology who was famous for eternally mourning her dead children. Niobe was the daughter of King Tantalus and Queen Dione, and married Amphion, king of Thebes. She boasted that because of her six (or seven) fine sons and six (or seven) beautiful daughters, she deserved worship more than the goddess Leto, who had only two children, Apollo and Artemis. In anger, Leto ordered Apollo and Artemis to kill Niobe's children with their arrows. As Niobe wept unceasingly for her children, the gods in pity changed her into a rock that spouted water like tears. According to tradition, this rock with a waterfall below stands on Mount Sipylon in what is now Turkey. Jon D. Mikalson

Niobium, *ny OH bee uhm,* also called *columbium,* is a soft, silver-white or gray metallic element. In nature, it occurs chiefly combined with *tantalum,* another rare metal. Manufacturers alloy much niobium with nickel and steel to make strong structural materials that are resistant to high temperatures. Niobium is also used in the cores of certain nuclear reactors because it allows neutrons to penetrate easily and can withstand high-temperature reactor coolants. At extremely low temperatures, niobium becomes a *superconductor,* and so it is used in making superconducting magnets (see **Superconductivity**).

Niobium has the chemical symbol Nb. Its atomic number is 41, and its atomic weight is 92.90638. It melts at 2468 ± 10 °C and boils at 4742 °C. Niobium has a density of 8.57 grams per cubic centimeter at 20 °C (see **Density**). Charles Hatchett, a British chemist, discovered niobium in 1801. Sara Steck Melford

Nirvana, *nihr VAH nuh,* according to Buddhist belief, is perfect peace and blessedness. The attainment of nirvana enables a person to escape from a painful, continuous cycle of death and rebirth. This cycle is caused by an individual's worldly desires, such as a craving for fame, immortality, and wealth. People attain nirvana when such desires are completely eliminated. When they die, their cycle of death and rebirth ends.

Buddha, the founder of Buddhism, preached that nirvana can be attained by following a Middle Way between self-indulgence and self-denial, and by practicing the Noble Eightfold Path. The Noble Eightfold Path con-

sists of eight aspects of correct living, including proper behavior, proper meditation, and proper insight into truth. Frank E. Reynolds

See also **Buddhism** (The dharma).

Nitrate is any kind of compound that contains the inorganic nitrate ion (NO_3^-). Nitric acid (HNO_3) is a nitrate. Most metals form nitrate salts when combined with nitric acid. In nature, there are relatively few nitrate minerals. Two important nitrates, potassium nitrate (KNO_3) and ammonium nitrate (NH_4NO_3), are used as fertilizers to replenish nitrogen in the soil. Bacteria in the soil form nitrates from organic compounds containing nitrogen. Plants use these nitrates to make proteins. Nitrates can also form in the atmosphere. There, nitrogen oxide may combine with water to produce nitric acid, a part of the pollutant acid rain. Nitrates are also used in explosives, fireworks, heart medicine, and photographic films. People take in nitrates daily, primarily from vegetables. But consuming large amounts of nitrates can help produce toxic substances in the body. See also **Nitric acid; Nitrogen cycle.** Emily Jane Rose

Nitrate of silver. See Silver nitrate.

Nitric acid is a strong inorganic acid that has many industrial uses. Its principal use is for the production of fertilizers and explosives. Large quantities of nitric acid are produced during thunderstorms and fall to the earth in rain. The rain falls as a very weak solution of nitric acid. The production of nitric acid during thunderstorms allows nitrogen from the air to become part of the soil in a form that plants can use (see **Nitrogen cycle**). Nitric acid was one of the first acids known. Many alchemists of the Middle Ages used it in their experiments.

Nitric acid is such a powerful oxidizing agent that it dissolves many metals. But it does not attack gold and platinum. A drop of nitric acid on a piece of jewelry tells whether it is made of genuine gold or platinum. These two metals can be dissolved by *aqua regia,* a mixture of nitric acid and hydrochloric acid (see **Aqua regia**).

Nitric acid is used to manufacture ammonium nitrate, NH_4NO_3, an ingredient of many fertilizers, and to make explosives, flares, and rocket propellants. The chemical industry uses nitric acid to prepare nylon and many organic compounds that are used as dyes and drugs. Nitric acid reacts with toluene in the presence of sulfuric acid to form trinitrotoluene, better known as TNT.

Commercially, most nitric acid is produced by oxidizing ammonia using a platinum catalyst. Ammonia and air are passed through heated platinum gauze. The gases react to form water, nitric oxide (NO), and nitrogen dioxide (NO_2). Upon cooling, this gaseous mixture forms nitric acid. This method is called the *Ostwald process,* after Wilhelm Ostwald, the German chemist who developed it. Nitric acid is also produced by heating saltpeter with sulfuric acid. In this process, nitric acid is recovered by distillation.

Nitric acid is a colorless liquid with a suffocating odor. It develops a yellow color if kept in bottles that are not tightly stoppered. This is due to nitrogen dioxide gas that results from decomposition of the acid. Nitric acid stains the skin yellow and can cause burns. Its chemical formula is HNO_3. The metal salts of nitric acid, called *nitrates,* are soluble in water. Marianna A. Busch

Nitrite is a compound of the nitrite *anion* (NO_2^-) and some other element. An anion is a negatively charged ion. Inorganic nitrites are stable and soluble in water. Most organic nitrites are made from alcohols. They are unstable when in the presence of acid, but they are preserved satisfactorily in neutral or mildly alkaline solutions. Nitrites are used in medicine for heart ailments. Sodium nitrite is important in making dyes. It is also used to cure meats, such as bacon, to prevent botulism and to give the meat a pinkish color. Under certain conditions, sodium nitrite may combine with chemicals called amines to form nitrosamines, which can cause cancer. The U.S. Department of Agriculture limits the amount of sodium nitrite allowed in cured meats. Nitrites are also used in photography and in the manufacture of organic materials. Patrice C. Bélanger

Nitrogen is a nonmetallic chemical element. It occurs in nature as a colorless, odorless, and tasteless gas. This gas makes up about 78 percent of the earth's atmosphere by volume. Daniel Rutherford, a Scottish physician, discovered nitrogen in 1772.

The chemical symbol for nitrogen is N. Nitrogen's atomic number is 7, and its atomic weight is 14.0067. Nitrogen gas consists of two nitrogen atoms bonded together to form a molecule with the chemical formula N_2. The gas may be condensed to a liquid that boils at −195.8° C and freezes at −209.9° C. Nitrogen gas does not combine easily with other elements. But nitrogen atoms are part of many chemical compounds.

Nitrogen and life

All organisms must have nitrogen to live. Nitrogen is part of all *amino acids,* the building blocks of proteins. Plants make all the amino acids they need. Animals produce only some of these compounds and must get the rest by eating other animals and plants.

Nitrogen is constantly being removed from the air and returned to it in a series of chemical reactions known as the *nitrogen cycle.* In the first part of this process, called *nitrogen fixation,* nitrogen gas is converted to nitrogen compounds that plants can use. Nitrogen in the air reacts with water to form nitric acid, which is deposited in the soil by rain. In addition, certain bacteria and yeasts change nitrogen from the air into compounds plants can use. Bacteria in swellings on the roots of *legumes,* such as peas and beans, can also do this.

In the next stage of the nitrogen cycle, plants use nitrogen compounds in the soil to make protein. Fertilizers increase the usable nitrogen in the soil. Plant proteins are then eaten by animals. In the final stage, the decay of animal wastes and of dead plants and animals returns nitrogen compounds to the soil and nitrogen gas to the atmosphere. See Nitrogen cycle.

Uses of nitrogen

Manufacturers obtain pure nitrogen by making liquid air. They then separate the nitrogen from the oxygen and other gases in air by the process of distillation (see **Liquid air**). During the process of distillation, the nitrogen is collected and stored under pressure in specially designed metal containers. Small amounts of nitrogen can be prepared by gently heating a water solution of ammonium nitrate.

Pure nitrogen gas is used as a "blanket" by certain industries to keep oxygen away from specific areas. For example, the food industry uses nitrogen to prevent oxy-

gen from reaching such foods as fresh fruits and spoiling them. The food industry also uses liquid nitrogen to quick-freeze food and to refrigerate food during transport. Scientists use liquid nitrogen to produce the low temperatures needed in some experiments.

Production of nitrogen compounds. The principal use of nitrogen is in the production of ammonia (NH_3), a gas that consists of nitrogen and hydrogen. Manufacturers produce ammonia chiefly by the Haber process. In this process, nitrogen and hydrogen are combined at high temperatures and pressures (see **Haber process**). Ammonia is used as a fertilizer, as a refrigerant, and in the production of nitric acid and other chemicals. Household ammonia, which is a cleaning agent, consists of a dilute solution of ammonia gas in water. See **Ammonia**.

Nitric acid is a second major nitrogen compound produced by industry. It is made from ammonia in a series of reactions called the Ostwald process. Nitric acid is used mainly to make fertilizer (see **Nitric acid**). Nitrogen compounds are also important in drugs, dyes, explosives, poisons, and synthetic fibers.

Nitrogen in agriculture. Almost all fertilizers contain nitrogen, which is necessary for the healthy growth of plants. Farmers may inject ammonia gas directly into the soil. Liquefied ammonia and such compounds as ammonium sulfate and ammonium nitrate also are used as nitrogen fertilizers. Other sources of nitrogen include nitrate compounds, manure, and *guano,* the waste material of sea birds. See **Fertilizer**.

Farmers can also supply nitrogen to their fields by rotating crops. In crop rotation, a farmer plants a field one year with corn, wheat, or some other crop that removes nitrogen from the soil. The next year, the farmer plants the field with legumes that restore nitrogen to the soil.

Nitrogen and pollution

People influence the nitrogen cycle. The use of nitrogen fertilizers adds nitrogen to the soil. Rain water carries unused fertilizer and other nitrogen compounds into streams and lakes, where the compounds cause water plants and algae to multiply. As the plants and algae die and decay, they use up oxygen, endangering animal life in the body of water.

Nitrogen oxides pollute the air. Pollutants are released by burning fossil fuels, such as coal and gasoline. Sunlight causes nitrogen oxides in the lower atmosphere to react with oxygen to form ozone, an irritating substance in *smog.* Nitrogen oxides can also return to earth as nitric acid, a major ingredient of *acid rain.*

Jet engines produce nitrogen oxides in the upper atmosphere, where the compound may harm the environment in a different way. Nitrogen oxides can promote the decomposition of ozone in the upper atmosphere. Here, ozone benefits animals and plants by shielding them from harmful ultraviolet light. Emily Jane Rose

Nitrogen cycle is the circulation of nitrogen among the atmosphere, the soil and water, and the plants and animals of the earth. All living things require nitrogen, but most organisms cannot use the nitrogen gas (N_2) that makes up about 78 percent of the atmosphere. They need nitrogen that has combined with certain other elements to form organic compounds. But the supply of this *fixed nitrogen* is limited, so complex methods of recycling nitrogen have developed in nature.

One part of the nitrogen cycle involves circulation of nitrogen between the soil and living things. After plants and animals die, they undergo decomposition by certain bacteria and fungi. These microorganisms produce ammonia (NH_3) from nitrogen compounds in dead organic matter and in body wastes excreted by animals. Plants absorb some of the ammonia and use it to make proteins and other substances essential to life. The rest of the ammonia is changed into nitrates (NO_3^- compounds) by *nitrifying bacteria.* First, nitrifying bacteria called *nitrite bacteria* convert ammonia into nitrites (NO_2^- compounds). Then *nitrate bacteria* change nitrites into nitrates. Plants absorb most of the nitrates and use them in the same way as ammonia. Animals get nitrogen by eating plants or by feeding on animals that eat plants.

In another part of the cycle, a process called *nitrogen fixation* constantly puts additional nitrogen into biological circulation. In this process, *nitrogen-fixing* bacteria in the soil or water, or living within plants such as legumes, convert nitrogen from the atmosphere into nitrogen-containing organic substances.

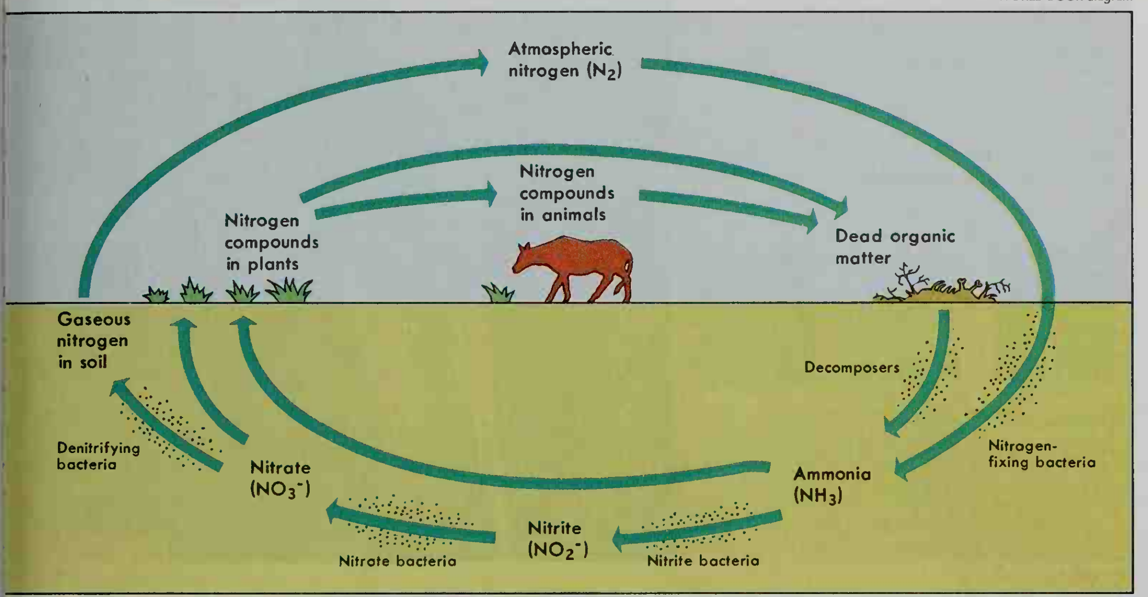
While nitrogen fixation converts nitrogen from the atmosphere into organic compounds, a series of processes called *denitrification* returns an approximately equal amount of nitrogen to the atmosphere. *Denitrifying bacteria* convert nitrates and nitrites in soil into nitrogen gas or into gaseous compounds such as nitrous oxide (N_2O) or nitric oxide (NO). However, fixed nitrogen may circulate many times between organisms and the soil before denitrification returns it to the atmosphere.

Some human activities influence the nitrogen cycle. Industry fixes vast quantities of nitrogen to produce fertilizer, much of which is washed off farmland and into waterways, polluting the water. The combustion of certain fuels produces nitrogen compounds that pollute the air. These compounds may also play a part in the warming of the earth's climate (see **Greenhouse effect**).

William A. Reiners

See also **Nitrogen; Legume; Nitrate; Nitrite.**

Nitroglycerin, *NY truh GLIHS uhr ihn,* also called *nitroglycerol,* is a powerful explosive. Its chemical formula is $C_3H_5(ONO_2)_3$. It is the principal explosive ingredient in dynamite. Nitroglycerin also is used by doctors as a heart medication.



As an explosive. Nitroglycerin is a heavy, clear or straw-colored liquid with a sweet, burning taste. The liquid freezes at slightly below room temperature to form needlelike crystals that explode when heated or broken. An explosion of nitroglycerin is about three times as powerful as that of an equal amount of gunpowder.

Chemists once made nitroglycerin by slowly adding glycerol, also known as glycerin, to concentrated nitric and sulfuric acids. After the mixture was stirred, the nitroglycerin formed a layer on top of the two acids. This layer was drawn off and washed, first with water, and then with a solution of sodium carbonate. Today, chemists make nitroglycerin in smaller, safer batches in a type of tank called a *Biazzi nitrator.*

Ascanio Sobrero, an Italian chemist, discovered

The nitrogen cycle Nitrogen makes up about 78 percent of the earth's atmosphere, but most organisms cannot use nitrogen in its gaseous form. *Nitrogen-fixing bacteria* convert atmospheric nitrogen into a form that other living things can use. After nitrogen has been fixed by the bacteria, it circulates repeatedly between organisms and the soil. *Denitrifying bacteria* help regulate the amount of nitrogen in biological circulation by changing some fixed nitrogen back into a gas.

WORLD BOOK diagram

itroglycerin in 1846. For years, nitroglycerin was not ised widely because it did not *detonate* (explode) relibly when ignited. Alfred Nobel, a Swedish chemist, deeloped a detonating cap that proved ideal for explodng nitroglycerin. In 1867, Nobel patented dynamite, an nvention that provided a safe and convenient means for ransporting and using nitroglycerin. Nitroglycerin uickly became the most widely used explosive and renained so until about the 1950's.

As a medication. Sobrero noted that tasting a tiny lrop of nitroglycerin gave him a violent headache. Docors knew that amyl nitrite, a substance discovered a few ears before nitroglycerin, relieved chest pain and lowred blood pressure. The fact that amyl nitrite also aused severe headaches led doctors to study the effect f nitroglycerin on the heart and on blood circulation.

Today, nitroglycerin is used to treat *angina,* severe hest pain that occurs when the heart does not receive nough oxygen through the blood. Nitroglycerin works y causing the blood vessels to widen, reducing the eart's workload and permitting more blood and oxygen o reach the heart.

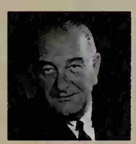
To relieve an angina attack, most patients take nitrolycerin in the form of a tablet that is placed under the ongue or against the cheek, where it slowly dissolves. n oral spray is also used to treat attacks. Swallowing he medication delays its effectiveness because the liver apidly converts nitroglycerin to slower-acting forms. To revent angina, a nitroglycerin patch containing a suply of the medication is attached to the skin like an adesive bandage. The patch slowly and continuously reeases nitroglycerin, which seeps through the skin to the loodstream. Nitroglycerin also may be taken in capsule orm or applied as an ointment. Robert J. Linhardt

See also Cordite; Dynamite; Explosive; Glycerol; Heart (Coronary artery disease).

Nitrous oxide, *NY truhs AHK syd,* is a colorless, odorless gas that physicians and dentists use to make patients insensitive to pain. Such drugs are called *anesthetics.* Nitrous oxide is commonly called *laughing gas* because people sometimes become excited and silly after they inhale it. Nitrous oxide causes unconsciousness if enough of it is inhaled.

Nitrous oxide is pleasant to inhale and it takes effect quickly. It also wears off rapidly and is nonflammable. Doctors always give oxygen with nitrous oxide because the body cannot use the oxygen in nitrous oxide molecules.

Nitrous oxide is a weak anesthetic, and it must be used at high concentrations to be effective. However, lower concentrations can relieve pain without producing true anesthesia and loss of consciousness. Such *subanesthetic* doses are frequently administered to women during childbirth and to patients undergoing dental treatment. However, the greatest use of nitrous oxide is as a supplement to more powerful anesthetics during major surgery.



Nitrous oxide was first prepared in 1772 by Joseph Priestley, a British chemist. In 1844, Horace Wells, a Hartford, Connecticut, dentist, was the first to actually use nitrous oxide. He inhaled the gas himself before having a tooth extracted, and the tooth was pulled painlessly. Nitrous oxide anesthesia became widely used in dentistry during the 1860's.

Nitrous oxide is also called *nitrogen monoxide* or *dinitrogen monoxide.* Its chemical formula is N_2O. It is used in industry as a propellant in aerosol products and as a "tracer gas" to locate leaks in vacuum and pressure lines. Edwin S. Munson

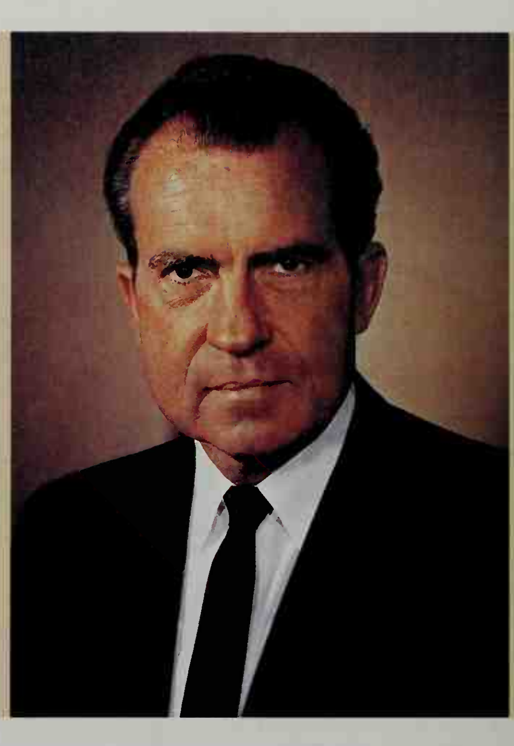
Richard Nixon

37th president of the United States 1969-1974



L. Johnson
36th president
1963-1969
Democrat

Nixon
37th president
1969-1974
Republican

Ford
38th president
1974-1977
Republican

Spiro T. Agnew
Vice president
1969-1973

Gerald R. Ford
Vice president
1973-1974

The White House

Nixon, Richard Milhous (1913-1994), was the only president of the United States ever to resign from office. He left the presidency on Aug. 9, 1974, while facing certain impeachment for his involvement in the Watergate scandal. This scandal included a break-in at the Democratic national headquarters and other illegal activities by employees of Nixon's 1972 reelection committee and members of his executive staff. Nixon's attempts to cover up these crimes became a major part of the scandal.

Nixon was succeeded as president by Vice President Gerald R. Ford. One month after Nixon resigned, Ford pardoned him for all federal crimes he may have committed during his presidency.

Although Nixon left office in disgrace, he won respect for his conduct of foreign policy. As president, he ended U.S. military participation in the Vietnam War in 1973 and eased the tension that had existed for years between the United States and both China and the Soviet Union. He became the first president to visit China while in office. He also visited the Soviet Union. He won congressional approval of U.S.-Soviet trade agreements and agreements to limit the production of nuclear weapons.

At home, Nixon was challenged by sharply rising prices. He placed government controls on wages and prices to halt inflation, but the controls had little effect. Nixon ended the military draft and created an all-volunteer system for the U.S. armed services. He signed into law a wide variety of economic, social, and environmental legislation that made him seem almost a liberal.

When Nixon was elected president in 1968, he climaxed one of the most extraordinary political comebacks in U.S. history. In 1960, while serving as vice president under President Dwight D. Eisenhower, Nixon ran for the presidency and lost to John F. Kennedy. In 1962, Nixon was defeated when he ran for governor of California, his home state. After this loss, Nixon held what he called his "last press conference." Reporters wrote his political obituary.

But in 1968, Nixon showed that he was politically very much alive. He won several primary elections and again became the Republican candidate for president. This time, Nixon defeated Vice President Hubert H. Humphrey, his Democratic opponent, and former Governor George C. Wallace of Alabama, the candidate of the American Independent Party. In 1972, Nixon won a second term in a landslide victory over Democratic Senator George S. McGovern of South Dakota.

Melvin Small, the contributor of this article, is Professor of History at Wayne State University and author of The Presidency of Richard Nixon.

Important dates in Nixon's life

1913 (January 9) Born in Yorba Linda, California.
1934 Graduated from Whittier College.
1940 (June 21) Married Thelma Catherine (Pat) Ryan.
1942-1946 Served in the U.S. Navy during World War II.
1946 Elected to the U.S. House of Representatives.
1948 Reelected to the House.
1950 Elected to the U.S. Senate.
1952 Elected vice president of the United States.
1956 Reelected vice president.
1960 Defeated for president by John F. Kennedy.
1962 Defeated for governor of California by Governor Edmund G. (Pat) Brown.
1968 Elected president of the United States.
1972 Reelected president.
1974 (August 9) Resigned as president.
1994 (April 22) Died in New York City.

Tragedy and triumph both left an imprint on the Nixon presidency. The Vietnam War, *above,* continued through the early 1970's, though Nixon began a withdrawal of U.S. troops in 1969. A new era of space exploration began that same year, when Neil A. Armstrong and Buzz Aldrin became the first people to set foot on the moon. Armstrong photographed Aldrin on the moon, *left.*

The world of President Nixon

Antiwar protests on college campuses and elsewhere disrupted the nation during the late 1960's and early 1970's.
The women's liberation movement gained strength. In 1973, in *Roe v. Wade,* the Supreme Court ruled that the U.S. Constitution allows a woman to decide for herself if she will have an abortion in the first three months of pregnancy.
Concern for the environment developed as air and water pollution became increasingly serious problems.
Golda Meir, a former Milwaukee schoolteacher, became prime minister of Israel in 1969. She served until 1974.
School desegregation rulings by federal courts in the early 1970's resulted in the busing of students from one neighborhood to another in a number of U.S. cities.
China joined the United Nations in 1971.
The minimum voting age in all U.S. elections was lowered from 21 to 18 by the 26th Amendment to the Constitution, ratified in 1971.
Civil war in Pakistan in 1971 resulted in the creation of Bangladesh from the territory that had been East Pakistan.
Revolution in Chile in 1973 led to the death of President Salvador Allende. Allende had been the first Marxist elected democratically to head a nation in the Western Hemisphere.
The fourth Arab-Israeli war erupted in October 1973, when Egypt and Syria attacked Israel.
An Arab oil embargo reduced supplies of petroleum to the United States and other nations in 1973 and 1974.
Watergate stunned the nation as it developed into the biggest political scandal in U.S. history. It led to the resignations of top White House aides and, eventually, Nixon himself.

Robert Ellison, Black Star; NASA

Among the group of vice presidents who became president, Nixon was the first who did not succeed the president under whom he had served. Nixon became vice president under Eisenhower at the age of 40. He was the second youngest man to hold that office. John C. Breckinridge was 36 when he became vice president under James Buchanan in 1857. Before Nixon was elected vice president, he was elected twice to the U.S. House of Representatives and once to the U.S. Senate.

Friends knew Nixon as a painfully sensitive man. Nixon felt especially hurt by what he considered unfair criticism. But in politics, he won fame as a tough, forceful campaigner. He liked a good fight and had a fierce determination to succeed.

Early life

Boyhood. Richard Milhous Nixon was born on Jan. 9, 1913, in Yorba Linda, California, a village 30 miles (48 kilometers) southeast of Los Angeles. He was the second of the five sons of Francis Anthony (Frank) Nixon and Hannah Milhous Nixon. Nixon's father had moved from Ohio to southern California. There he met and married Hannah Milhous, who had come from Indiana with her parents and a group of other Quakers. Frank Nixon later gave up his Methodist faith and became a Quaker. At one time or another, he worked as a streetcar conductor, a carpenter, a laborer, and a farmer.

In 1922, the Nixon family moved to East Whittier (now Whittier). There Frank Nixon opened a combination grocery store and gasoline station. Richard had four brothers, Harold (1909-1932), Donald (1914-1987), Arthur (1918-1925), and Edward (1930-).

At the age of about 10, Richard began working part-time as a bean picker. During his teens, he worked as a handyman in a packing house, janitor at a swimming pool, and barker at an amusement park. While in college, he served as bookkeeper and as manager of the vegetable department of his father's store.

Education. Nixon attended elementary schools in Yorba Linda, Whittier, and nearby Fullerton. At Whittier High School, history and civics were his favorite subjects. An excellent student, he also played football and starred in debating. At the age of 17, Nixon entered Whittier College, a Quaker institution. He won several debating awards, and he became president of the student body.

© Chad Slattery, After Image

Richard Nixon's birthplace was this small frame house in Yorba Linda, California. He was the second of the five sons of Francis Anthony (Frank) Nixon and Hannah Milhous Nixon.

Nixon graduated from Whittier in 1934 and won a scholarship from the Duke University School of Law in Durham, North Carolina. Walter F. Dexter, then president of Whittier College, wrote in a letter of recommendation for Nixon: "I believe he will become one of America's important, if not great, leaders." At Duke, Nixon was elected president of the student law association. He also won election to the Order of the Coif, the national law fraternity for honor students. Nixon ranked third in the 1937 graduating class of 44 students.

Lawyer. The Great Depression still gripped the United States when Nixon left Duke. There were few jobs. Nixon tried unsuccessfully to join the Federal Bureau of Investigation and then a law firm in New York City. He finally returned home and joined a Whittier law firm, in which he became a partner. Nixon and several investors later formed a company to make and market frozen orange juice, but it went bankrupt in 18 months. At the age of 26, Nixon became the youngest member of the Whittier College Board of Trustees.

Nixon's family. Shortly after returning to Whittier, Nixon met Thelma Catherine Ryan (1912-1993). She had been born in a mining camp at Ely, Nevada. Her father nicknamed her Pat because she was born on the eve of St. Patrick's Day. When Pat was a baby, her parents moved to a farm in California. They died before Pat finished high school. Pat put herself through the University of Southern California, occasionally working as an extra in Hollywood films.

When Nixon met Pat, she was teaching commercial subjects at Whittier High School. They met during tryouts for a community theater play. They were married on June 21, 1940. The Nixons had two daughters, Patricia (Tricia), born in 1946, and Julie, born in 1948. Julie married David Eisenhower, grandson of former President Eisenhower, in 1968. Tricia married Edward Cox in 1971.

Naval officer. In January 1942, during World War II, Nixon left Whittier to take a job in the tire rationing section of the Office of Price Administration in Washington, D.C. Eight months later, he joined the Navy as an ensign. Nixon served in a naval air transport unit in the Pacific and was promoted to lieutenant commander before the war ended in 1945.

Career in Congress

Since 1936, the voters of Nixon's home congressional district had elected a Democrat, Jerry Voorhis, to the U.S. House of Representatives. Republican leaders searched for a "new face" to oppose Voorhis in the 1946 election. Nixon, then awaiting discharge from the Navy, convinced a number of leading Republicans that he was the best candidate.

Professional politicians gave Nixon little chance of defeating Voorhis, a veteran campaigner. But Nixon campaigned aggressively, implying that Voorhis was supported by Communists, though there was little evidence to prove that he was. Nixon won the election.

U.S. representative. In the House of Representatives, Nixon was proudest of his work on a committee that laid the groundwork for the Marshall Plan and other foreign aid programs (see **Foreign aid**). Nixon helped write the Taft-Hartley Act, which established controls over labor unions. In addition, he became a member of the House Committee on Un-American Activities.

In 1948, Nixon was reelected to the House. The Alger Hiss case, which began that same year, brought Nixon into national prominence. Hiss, a former State Department official, was accused of having passed classified State Department documents to a Soviet spy ring during the 1930's. The matter rested with Hiss's word against that of his accusers. Many members of the Un-American Activities Committee wanted to drop the case, but Nixon insisted that Hiss was a traitor. The question of Communists in government was a fierce political issue at the time. In 1950, a federal District Court jury convicted Hiss of perjury in denying that he had ever given secret documents to Soviet agents. See **Hiss, Alger**.

U.S. senator. In 1950, at the peak of his prominence in the Hiss case, Nixon ran for the U.S. Senate. He opposed Representative Helen Gahagan Douglas, a New Deal Democrat. During the campaign, Nixon emphasized charges, made originally by Douglas's foes in the Democratic primary election, that she was "soft" on Communism. He called her the "Pink Lady." Douglas took revenge by labeling Nixon "Tricky Dick." In one of California's most savage political contests, Nixon defeated Douglas by nearly 700,000 votes.

In the Senate, Nixon served on the Labor and Public Welfare Committee. He also became a popular speaker at Republican Party affairs and at civic meetings in all parts of the United States.

The 1952 campaign. In 1952, the Republican National Convention nominated Nixon for vice president to run with General Dwight D. Eisenhower. A highlight of the campaign was a dispute over an $18,000 fund set up by Nixon's supporters in California. They had organized the fund in 1950 to enable Nixon to campaign for Republican programs and candidates in both election and nonelection years. Nixon and his friends showed that they had used the money only for political expenses, but members of the media labeled it a "secret slush fund." Many Republicans, fearing that Nixon might hurt Eisenhower's chances of victory, demanded that Nixon withdraw from the ticket.

UPI/Bettmann Newspho

Representative Nixon won national attention during the Alger Hiss case. He worked with Whittaker Chambers, *left,* who accused Hiss of spying, and investigator Robert Stripling, *right.*

Nixon's cause seemed hopeless. Then, on Sept. 23, 1952, Nixon stated his case in an emotional address over television and radio. He discussed his personal finances in detail, showing that he had not profited personally from the fund. He said that "Pat doesn't have a mink coat. But she does have a respectable Republican cloth coat." And he vowed to keep Checkers, a cocker spaniel that had been a gift to his daughters. After the program, Republicans hailed Nixon as a hero. Eisenhower put his arm around Nixon when they next met and declared, "You're my boy."

During the campaign, Nixon accused his Democratic opponents of not recognizing the Communist threat to the United States and the world. He charged that a vote for the Democrats was a vote for socialism at home and surrender abroad. Eisenhower and Nixon went on to defeat their Democratic opponents, Governor Adlai E. Stevenson of Illinois and Senator John J. Sparkman of Alabama.

Vice president (1953-1961)

Eisenhower succeeded Democratic President Harry S. Truman in 1953. He gave Nixon the job of working with members of Congress to smooth out possible quarrels with the new administration. Eisenhower also assigned Nixon to preside over Cabinet meetings and the National Security Council in the president's absence. Nixon took a greater role in the executive branch of the government than any previous vice president.

Eisenhower's illnesses. Nixon's biggest test as vice president began Sept. 24, 1955, when Eisenhower suffered a heart attack. Nixon calmly went about his normal duties, presided at Cabinet meetings, and kept the wheels of government moving smoothly. He also stepped in when the president suffered another illness in June 1956 and a stroke in November 1957. The arrangement Nixon worked out with Eisenhower later served as a basis for the 25th Amendment to the Constitution of the United States. The amendment, ratified in 1967, provides for the vice president acting for the president when the president is unable to perform the duties of the office.

The 1956 election. Many people wondered whether Eisenhower would ask Nixon to run with him again in 1956. For a while, the president seemed to be considering the idea of dropping his controversial running mate. Finally, however, the president declared: "Anyone who attempts to drive a wedge of any kind between Dick Nixon and me has just as much chance as if he tried to drive it between my brother and me." Eisenhower and Nixon defeated the Democratic nominees, Adlai E. Stevenson and Senator Estes Kefauver of Tennessee.

Overseas missions. Nixon frequently acted as spokesperson for the government on trips to other nations. As vice president, he toured nearly 60 countries, visiting every continent except Antarctica. During a tour of Latin America in the spring of 1958, Nixon faced violence and danger. In Peru, Communist agents led groups that booed and stoned him and even spit at him. In Venezuela, mobs smashed the windows of Nixon's car. However, he was not hurt.

Nixon traveled to the Soviet Union in July 1959 to open an American exhibit in Moscow. As he and Premier Nikita S. Khrushchev walked through a model home, they argued over which economic system was better, capitalism or Communism. At one point in the "kitchen debate," Nixon startled his hosts by pointing his finger at Khrushchev and saying bluntly: "You don't know everything."

UPI/Bettmann Newsphotos

Nixon and Dwight D. Eisenhower were a winning team during the presidential campaigns of 1952 and 1956.

Defeat by Kennedy. Few people doubted that Nixon would be the Republican presidential candidate in 1960. Some party leaders thought Governor Nelson Rockefeller of New York might make an all-out fight for the nomination. But Rockefeller withdrew, and the Republican National Convention nominated Nixon on the first ballot. Nixon chose Henry Cabot Lodge, Jr., U.S. ambassador to the United Nations, as his vice presidential running mate. The Democrats nominated Senator John F. Kennedy of Massachusetts for president and Senator Lyndon B. Johnson of Texas for vice president.

The presidential campaign was close and hard-fought from start to finish. Kennedy argued that Republican

Presidential candidates John F. Kennedy and Richard M. Nixon took part in four televised debates in 1960. It was the first time presidential candidates had met in face-to-face debates.

methods had slowed U.S. economic growth, contributing to what he called a loss of American prestige abroad. Nixon cited figures to show that the economy was growing at a satisfactory rate. Kennedy also charged that the Republicans had allowed the Soviet Union to overtake the United States in missile production.

Nixon and Kennedy took part in a unique series of four televised debates. The television and radio audiences included most of the nation's voters. These "great debates" marked the first time in U.S. history that presidential candidates argued campaign issues face-to-face. Kennedy's calm manner and appearance in the first debate, contrasted with Nixon's apparent nervousness, helped Kennedy win over many voters who had been undecided about their choice.

Nixon lost to Kennedy in one of the closest presidential elections in U.S. history. Kennedy won by 114,673 popular votes out of nearly 69 million total votes. Nixon carried 26 states to 22 for Kennedy, but Kennedy received 303 electoral votes compared to Nixon's 219. Senator Harry F. Byrd of Virginia got 15 electoral votes. Widespread charges of fraudulent vote counting in Illinois and Texas cast some doubt on Kennedy's victory.

Political comeback

Defeat in California. In 1961, Nixon began to practice law in Los Angeles. In 1962, he decided to run for governor of California. Nixon won the Republican nomination for governor by defeating Joseph C. Shell in the state primary election. But the victory was costly. Conservative Republicans had supported Shell, and Nixon's triumph split the party. In the election, California's governor, Democrat Edmund G. (Pat) Brown, beat Nixon by about 300,000 votes.

New York City lawyer. Nixon moved to New York City in 1963 and began a new law practice. He became a partner in a Wall Street law firm, and his associates placed his name first in the list of partners.

Some of Nixon's supporters wanted him to run for president in 1964, but Nixon felt that most Republicans favored Senator Barry M. Goldwater of Arizona. Goldwater won the Republican presidential nomination, and Nixon campaigned for him and other party candidates. President Lyndon B. Johnson, seeking his first full term, defeated Goldwater by a huge margin.

Goldwater's overwhelming defeat put Nixon back into the political limelight. Liberal and conservative Republicans were quarreling bitterly, and Nixon was the only nationally prominent man whom both groups could accept. In 1966, Nixon campaigned vigorously for Republican candidates in congressional elections. Republicans won 47 House seats and 3 Senate seats that had been held by Democrats. Nixon received much credit for the Republican victories.

In 1967, Nixon traveled around the world. His trip included visits to the Soviet Union and South Vietnam.

The 1968 election. In February 1968, Nixon announced that he would be a candidate for the Republican presidential nomination. Many Republicans wondered whether he could regain his voter appeal. They feared that his defeats by Kennedy and Brown had given him the image of a loser. But Nixon won primary elections by large margins in New Hampshire, Wisconsin, Indiana, Nebraska, Oregon, and South Dakota.

Nixon's chief opponents for the presidential nomination were Governors Nelson Rockefeller of New York and Ronald Reagan of California. But Nixon easily won nomination on the first ballot at the Republican National Convention in Miami Beach. The convention nominated Nixon's choice as running mate, Governor Spiro T. Agnew of Maryland.

The Democrats chose Vice President Hubert H. Humphrey and Senator Edmund S. Muskie of Maine. Former Governor George C. Wallace of Alabama and retired General Curtis E. LeMay ran as the candidates of the American Independent Party.

Both Nixon and Humphrey promised to make peace in Vietnam their main goal as president. The Vietnam War had begun in 1957 as a battle for control of South Vietnam between South Vietnam's non-Communist government and the Communist-led National Liberation Front, the Viet Cong. By the mid-1960's, the United States was deeply involved in the war as an ally of the South Vietnamese government.

Nixon called for a program of what he termed "new internationalism." Under this program, other nations would take over from the United States more of the responsibility for preserving world peace and helping developing countries. This plan later became known as the Nixon Doctrine. Nixon also pledged to strengthen law enforcement in the United States.

In the election, Nixon defeated Humphrey by only about 511,000 popular votes, 31,785,148 to 31,274,503. Wallace received 9,901,151 popular votes. Nixon won a clear majority of electoral votes, with 301. Humphrey received 191 electoral votes, and Wallace got 46. For the electoral vote by states, see **Electoral College** (table).

Nixon's first administration (1969-1973)

Foreign policy. Nixon's major goal was settlement of the Vietnam War. In his first inaugural address, Nixon said: "The greatest honor history can bestow is the title of peacemaker. This honor now beckons America."

The Vietnam War. The Vietnam peace talks, begun in

1968, continued in Paris. But the negotiators made little progress. In March 1969, Nixon ordered a stepped-up training program for South Vietnamese forces so they could gradually take over the major burden of fighting. He also ordered secret bombings of supply routes in Cambodia. In July, he began a gradual withdrawal of U.S. combat troops from Vietnam, a policy known as *Vietnamization.* Many Americans favored it, but many others wanted U.S. involvement to end immediately. Protests and demonstrations swept the nation.

In 1970, United States troops invaded Cambodia to attack North Vietnamese supply depots there. Nixon said the action would shorten the war, but many people felt it was expanding it. Protests broke out on hundreds of college campuses. At Kent State University in Ohio, National Guardsmen fired into a crowd of demonstrators, killing four students and wounding nine others. The shocked reaction of the nation and student strikes at other colleges, many of which closed until fall, forced Nixon to cut short the Cambodian campaign.

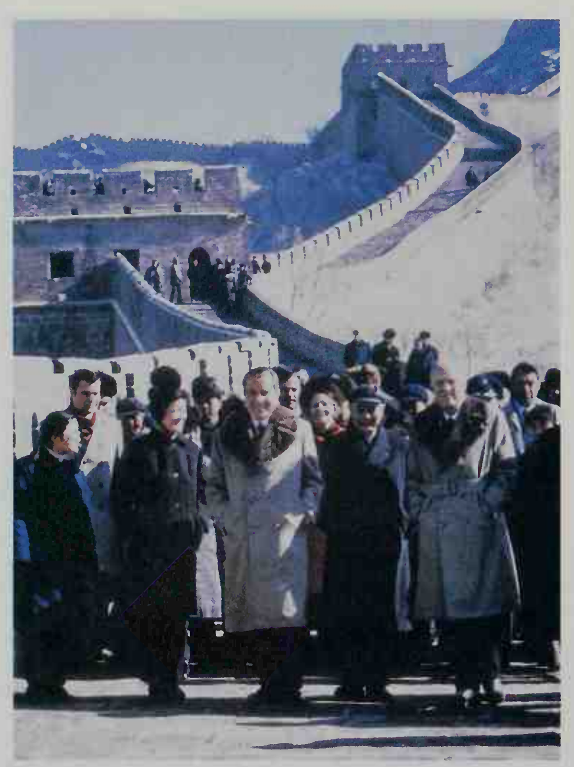
In May 1972, in response to a Communist offensive, Nixon ordered a blockade of North Vietnam to cut off its war supplies from the Soviet Union and China. The blockade included the mining of North Vietnam's ports and the bombing of its rail and highway links to China. In December 1972, after peace negotiations broke down, Nixon ordered extensive bombing of Hanoi, the North Vietnamese capital.

AP/Wide World

In his inaugural address in 1969, President Nixon pledged that the United States would seek "the title of peacemaker." Vice President Spiro T. Agnew is at Nixon's left.

Relations with China. In 1969, Nixon approved the removal of some restrictions on travel by Americans to China. He also encouraged the reopening of trade between China and the United States. The two nations had stopped trading with each other during the Korean War (1950-1953). In 1971, Nixon approved the export of certain goods to China. In February 1972, the president visited China for seven days, and he began the process that led to formal recognition of China by the United States in 1979.

Relations with the Soviet Union. In May 1972, Nixon visited the Soviet Union for nine days. During this visit, Nixon and Leonid I. Brezhnev, leader of the Soviet Communist Party, signed agreements to limit the production of nuclear weapons. Later that year, the Soviet Union became a major buyer of U.S. wheat.



The national scene. In August 1969, Nixon proposed a series of major domestic reforms, which he termed the *New Federalism.* One of the reforms called for a minimum federal payment to every needy family with children. Nixon also called for a form of national health insurance and suggested a *revenue sharing* plan in which the federal government would share its tax revenues with state and local governments. But action on the reforms was stalled as key Democrats and Republicans in Congress asked for major changes.

Major legislation. In spite of the legislative slowdown, Congress did enact several far-reaching laws. In 1969, it passed Nixon's proposal to establish a lottery system for

Nixon toured the Great Wall of China during his historic visit to that country in 1972. Relations between the United States and China improved dramatically during Nixon's presidency.

the military draft. Also in 1969, Congress approved extensive reforms in federal tax laws. These reforms included increases in personal income tax deductions and cuts in tax benefits for foundations and oil companies. In 1970, Congress established independent agencies to replace the Post Office Department and to operate the passenger trains that linked the nation's major cities. Also in 1970, Congress approved the lowering of the minimum voting age in federal elections to 18. It began the process that led to the ratification in 1971 of the 26th Amendment to the U.S. Constitution, which set the voting age at 18 for elections. In 1972, Congress approved Nixon's revenue sharing program. The legislation provided billions of dollars in federal tax money to state and local governments.

Inflation was one of Nixon's chief domestic concerns. Many Americans found that although they were earning more money than ever before, rising prices sharply cut their gains. In 1971, Nixon, concerned about how the economy might affect his reelection, set up a Pay Board to stop inflationary wage and salary increases and a Price Commission to regulate price and rent increases. The economy improved in 1972. In addition, the inflation rate slowed.

The ABM system. In March 1969, Nixon proposed a plan to build an antiballistic missile (ABM) system called *Safeguard.* Nixon said the new missiles were needed to protect U.S. underground missiles and bomber bases from enemy missile attack and to match comparable systems in the Soviet Union. The plan became one of the most heavily debated issues of Nixon's administration. Critics charged that the system would step up the arms race between the United States and the Soviet Union. They also claimed the new missiles would cost too much money and fail to destroy enemy missiles. In August, the Senate narrowly approved construction of the two ABM bases Nixon had requested.

Civil rights. Nixon developed a successful "Southern strategy" that resulted in virtually all the Southern States switching from Democratic to Republican during his time in office. The Democrats were perceived to be the party of civil rights and desegregation, while Nixon's Republicans appeared to be more supportive of the interests of Southerners not in favor of desegregation. For example, Republicans fiercely opposed the Supreme Court's 1971 ruling that children could be bused to integrate public schools. However, it was during Nixon's administration that legal segregation in Southern schools was finally ended. In addition, Nixon introduced the Philadelphia Plan, an affirmative action program for hiring in companies with large government contracts.

Supreme Court nominations. In 1969, Nixon's appointment of Warren E. Burger as chief justice of the United States was approved. However, in that same year and again in 1970, Nixon suffered a stinging defeat when he tried to appoint a conservative Southerner to the Supreme Court. In May 1969, Associate Justice Abe Fortas resigned from the court under charges of personal misconduct (see **Fortas, Abe**). Nixon nominated Judge Clement F. Haynsworth, Jr., of South Carolina to succeed Fortas. Some critics claimed that Haynsworth was antiblack. Others charged he was unethical for ruling in a case in which he had a financial interest. In November, the Senate rejected the nomination by a 55 to 45 vote.

In January 1970, Nixon nominated Judge G. Harrold Carswell of Florida for the seat. Opposition to Carswell grew quickly after several judges and law school deans rated him unqualified for the Supreme Court. In April, the Senate defeated the nomination by a 51 to 45 vote. It was the first time that two Supreme Court nominees of a president had been rejected since 1894, when Grover Cleveland was president.

After Carswell's defeat, Nixon charged that the Senate would not confirm a Southerner to the court. In May, the Senate unanimously approved Nixon's third choice, Judge Harry A. Blackmun of Minnesota. In 1971, the Senate approved Nixon's selection of Lewis F. Powell, Jr., and William H. Rehnquist for the court.

The U.S. space program opened a new era of exploration and discovery in 1969. On July 20, Apollo 11 astronauts Neil A. Armstrong and Buzz Aldrin became the first people to set foot on the moon. Through a special telephone connection while they were on the moon Nixon told them, "Because of what you have done, the heavens have become part of man's world."

Environmental problems attracted more and more attention during Nixon's administration. Many Americans began to realize that pollution of the air, land, and water endangered not only the quality of life but also life itself. In 1970, Nixon set up the Environmental Protection Agency to deal with pollution problems.

In addition, although Nixon was not known to be an environmentalist, he approved of the Clean Air Act Amendments, the Coastal Zone Management Act, the

Marine Mammal Protection Act, the Endangered Species Act, and the Safe Drinking Water Act. He also transferred land to the states for 642 new parks.

The 1972 election. Nixon and Agnew easily won renomination at the 1972 Republican National Convention in Miami Beach, Florida. The Democrats nominated Senator George S. McGovern of South Dakota for president. Sargent Shriver, former director of the Peace Corps, became McGovern's running mate.

In the election, Nixon won a landslide victory. He received almost 18 million more popular votes than McGovern—the widest margin of any U.S. presidential election. Nixon got 520 electoral votes, and McGovern received 17. John Hospers of the Libertarian Party won 1 electoral vote. See **Electoral College** (table).

Life in the White House. The Nixons brought a calm and reserved way of life to the White House. They preferred formal dress, including white ties and coats with tails for men and long gowns for women. They also favored fox trots and waltzes for dancing.

The Nixons' taste in art also was conservative. They replaced a number of the op art paintings on White House walls with traditional landscapes and portraits. Nixon was the first president to play the piano since Harry Truman. He occasionally played for guests. Nixon followed sports closely and impressed many visitors with his knowledge of baseball and football.

Pat Nixon worked hard to encourage Americans to volunteer to help deal with the country's social problems. She frequently traveled across the nation to support volunteer organizations.

A private man, Nixon did much of his work in a remote office in the Executive Office Building across from the White House. Shortly after taking office, he bought an estate in San Clemente, a beach resort in southern California. It became known as the Western White House because Nixon spent working vacations there. He also maintained a home in Key Biscayne, Florida.

Nixon's second administration (1973-1974)

Foreign affairs. On Jan. 27, 1973, the United States and the other participants in the Vietnam War signed agreements to stop fighting immediately and begin exchanging prisoners. The agreements climaxed several weeks of bargaining between North Vietnamese officials and Henry A. Kissinger, Nixon's national security adviser, who had begun secret talks with the Communists in 1969. The United States completed its troop withdrawal from South Vietnam in March. Nixon privately assured South Vietnam that the United States would use "full force" to aid the South Vietnamese if the Communists violated the agreements. Fighting did continue in 1973, but no U.S. troops reentered the war. Later that year, Kissinger became secretary of state.

Nixon continued his efforts to improve relations between the United States and China. In 1973, the two nations sent representatives to serve in each other's capital and exchanged visits by cultural groups.

Events at home. Nixon carried out a key campaign pledge in January 1973 when he ended the military draft. The military then became an all-volunteer force.

Disputes with Congress. Nixon's relations with the Democratic-controlled Congress grew increasingly strained during 1973. Nixon angered many members of Congress by *impounding* (not spending) several billion dollars in federal aid on projects that Congress had approved. Nixon called the projects wasteful.

The president suffered a major defeat when Congress forced him to end U.S. bombing in Cambodia. Nixon had argued that the bombing was needed to prevent a Com-

munist take-over of that nation. But Congress refused to provide money for bombing beyond Aug. 15, 1973.

Nixon received another major setback in 1973 when Congress overrode his veto of a resolution that limited presidential war powers. The War Powers Resolution gives Congress the power to halt after 60 days the use of any U.S. armed forces that the president has ordered into combat abroad. Passage of the resolution was the strongest action ever taken by Congress to spell out the warmaking powers of Congress and the president.
